NO. 1.

FINDING PHARAOH

THE GLORIOUS EMBLEM OF IMMORTALITY, ATTENDED BY A GUARD, PHOTOGRAPHED BY THE AUTHOR BY MAGNETIC LIGHT FROM A WALL IN THE ENTRANCE-PASSAGE TO THE TOMB OF SETHI I.

IN the neighborhood of three thousand three hundred years ago the land of Egypt, from Goshen to Thebes and beyond, was in an uproar.

The king was dead! **Rameses II.**, the precocious youth who at the age of ten had joined his warrior-father **Sethi I.** upon the throne; the ruler whom his people regarded as a god; the oppressor under whom the Israelites are said to have "sighed by reason of their bondage"; the great **Sesostris** of the Greeks,—had breathed his last.

The gay and busy life of the cities of the Delta was hushed, and the hundred gates of Thebes were only opened to those who ministered to the necessities of the living or who performed the sacred offices of the priesthood.

All street processions, minstrel-bands, and mountebanks fled appalled.

The cities which the great architect and artist-king had refounded,—**Ra'amses** and **Pithom**,—built by the forced labor of the Hebrews, were in their meridian splendor. The **Ramesseum** at Thebes was yet unsurpassed, and the colossal monolith which represented the

enthroned king was then unshaken. The glorious quartette of **Abou-Simbel**, but recently finished, sat, as now, smiling at the **Nubian** sun.

But **Rameses II.**, in whose honor, for whose glory, and by whose command all those grand creations were finished, could look upon them no more with mortal eyes.

His body was embalmed, and in due season the funeral procession followed. The mummied king was placed aboard the royal barge, and, attended by the priests and the images of the gods **Horus** and **Isis** and **Hathor**, was floated up the Nile to the **Theban** city of the Dead—to **Baban el-Muluk**, the **St. Denis**, the **Westminster Abbey** of the Kings, and a great lamentation went up to the skies from stricken Egypt.

As the funeral cortege journeyed slowly on, the frantic people of the cities and villages flocked to the quays to render homage to their dead ruler.

Even the despised and persecuted Hebrews suspended labor, because his cruel overseer had forgotten him.

The men rent their garments, the women tore their hair, and all gathered up the dust and threw it upon their heads.

Tens of thousands of funeral offerings were cast into the sacred river, and the gods were called upon to attend the dead throughout the sacred journey. It was a dire day indeed. When the sad company had arrived at the necropolis, all the complicated funeral rites were conducted with priestly ostentation.

Then the body of **Rameses** was sealed in the great sarcophagus which had been cut from the limestone of **Baban el-Muluk**.

The location of the tomb was well known then, because it had been the habit of the monarch to visit it frequently during its excavation.

More than once had the architect announced

that the tomb was ready, but he was as often met with the command to excavate still other vaulted halls and longer passages and side chambers, all to be finished with stuccoed walls adorned by representations in relief of the processions of the gods, of the life and work of the king, and of the scarabæus, the emblem of immortality. Moreover, all were to be richly colored.

"There is plenty of time for all that and much more before I am ready," said Rameses, and he returned to his capital.

But he died before the work was completed.

According to custom, after the burial the doorway to the tomb was walled up, and so disguised by rocks and sand as to make it impossible for any but the priests to discover its whereabouts.

And although his original tomb, that of his father Sethi I., and that of his son Menephtah, had long before been discovered, they were empty, and until July, 1881, the real hiding-place of the "Pharaoh of the Oppression" was a mighty secret. Then its door was opened, and soon after history in a measure repeated itself.

The story of its finding is more romantic

than any told in Egypt since Isis gathered the scattered remains of Osiris and buried his head within the alabaster temple at Abydos.

For a number of years the acute officials of the Museum of Antiquities at Bûlâq had seen funeral offerings and other antiquities brought from Thebes by returning tourists, which they knew belonged to the dynasty of Rameses II., of his father Sethi I., and of his grandfather Rameses I. Even scarabæes bearing the cartouch of the great king were displayed by the innocent purchasers. This being so, argued the clear-headed officials, the mummies of those royal personages must have been discovered by some one. By whom?

Professor Maspero, the Director-general of the Bûlâq Museum, at once organized a detective force to help him solve this conundrum.

Arrest after arrest was made, and the bastinado was applied to many a callous sole which had never felt even shoe or sandal. The women stood by and browbeat the sufferers into silence while they endured the torture, and the men refused all information.

In a line of tombs beyond the Ramesseum lived four sturdy Arabs named Abd-er-Rasoul. They supplied guides and donkeys to tourists who desired to visit the ruins of Thebes, and sold them genuine and spurious antiquities. When they found a mummy, it being forbidden by law to sell it, the head and hands and feet were wrenched off and sold on the sly, while the torso was kicked about the ruined temples until the jackals came and carried it away. I purchased a head and hand of one of the brothers amid the dark shadows of the temple at Qûrneh.

Early in 1881 circumstantial evidence pointed to Ahmed Abd-er-Rasoul as the one who knew more than he would tell. Professor Maspero caused his arrest, and he lay in prison at Kenh for some months. He also suffered the bastinado and the browbeating of the women repeatedly; he resisted bribes, and showed no melting mood when threatened with execution. His lips told no more than the unfound tomb—and not as much.

BÎBÂN EL-MULOUK : ENTRANCE-PASSAGE TO THE TOMB OF SETHI I. ON THE LEFT ARE THE CHAMBERS OF THE SCARABÆUS.

ENTRANCE TO THE TOMB OF SETI I. IN MOUNTAIN OF MOUNTAIN. ON THE
VALLEY OF THE TEMPLE OF THE PHARAOH.

Finally his brother Mohammed regarded the offer of "bakhshish," which Professor Maspero deemed it wise to make, as worth more to him than any sum he might hope to realize from future pillaging, and made a clean breast of the whole affair. How the four brothers ever discovered the hidden tomb has remained a "family secret."

On July 5th, 1881, the wily Arab conducted Herr Emil Brugsch Bey, curator of the Börlig Museum, to Deir el Bahari and pointed out the hiding place so long looked for.

A long climb it was, up the slope of the western mountain, till, after scaling a great limestone cliff, a huge, isolated rock was found. Behind this a spot was reached where the stones appeared to an expert observer and tomb searcher to have been arranged "by hand," rather than scattered by some upheaval of nature.

"Here," said the sullen guide; and "there" the enterprising Emil Brugsch Bey, with more than Egyptian shrewdness, soon had a staff of Arabs at work hauling the loose stones from a well into which they had been thrown.

The shaft had been sunk into the solid limestone to the depth of about forty feet, and was about six feet square.

Before going very far, a huge palm-log was thrown across the well and a block and tackle fastened to it to help bring up the debris.

When the bottom of the shaft was reached a subterranean passage was found which ran westward some twenty-four feet and then turned directly northward, continuing into the heart of the mountain straight except where broken for about two hundred feet by an abrupt stairway. The passage terminated in a mortuary chamber about thirteen by twenty-three feet in extent and barely six feet in height.

There was found the mummy of King Pharaoh of the Oppression, with nearly forty others of kings, queens, princes, and princes.

Not until June last was this most royal mummy released from its bandages. That event is my plea for telling now what I know of the romantic finding and the place thereof. A few months after the finding rock place, accompanied by my camera, I visited the Börlig Museum and photographed the entire "find." Emil Brugsch Bey is also an amateur photographer, and we had already fraternized during the Centennial Exhibition of 1876, where the Egyptian section was in his care. Therefore at Börlig I not only enjoyed a rare privilege at his hands, but also his friendly advice and assistance.

The photography done, we embarked upon the Khedive's steamer *Des Souf* for Luxor. There we were met by Professor Maspero and Mohammed Abou el Rasoul, and together we visited the scene of the latest drama of the Nile.

When we reached the chamber of the dead, the rope which had hauled the royal mummies from the tomb was made fast to our bodies, was swung over the palm-log, and we were lowered into the depths. As I dangled in mid-air and swayed from side to side, the rocky

THE HANDWRITING ON THE WALL

OUTER MUMMY-CASE OF QUEEN AHMES NOFRETARI.

pieces which I startled from their long slumber warned those who preceded me to "look out below."

At the bottom of the shaft, on the right and left wall of the entrance to the subterranean chamber, were written in black ink some curious inscriptions. By whom, no one can more than conjecture. It was the duty of the ancient "Inspector of Tombs" to make frequent visits to the royal dead, to repair the mummy-cases and wrappings, and, if necessary, to remove all to a safer tomb.

This handwriting on the wall may have been that of the Pharaonic tomb inspector whose duty it was to make record of every change. Professor Maspero being desirous of having photographs made of these inscriptions, the little American camera was set for

the work, and succeeded in securing them even there in the bowels of the earth.

Then, lighting our torches and stooping low, we proceeded to explore the long passage and the tomb at its terminus. The rough way was scattered with fragments of mummy-cases, shreds of mummy-cloth, bunches of papyrus plant, lotus flowers, and palm-leaf stalks, while here and there a funeral offering was found. After much stumbling we arrived at the inner chamber where, but a few weeks before, stood or reclined the coffins of so many royal dead.

The camera must have a long time for its delicate, difficult work, and so we did not need to hurry.

Seated upon a stone which for centuries had served as the pillow of priest or king while waiting for immortality, Herr Brugsch told me the whole story of his historical "find."

It was a unique interview. It made such an impression upon my mind that I can repeat the story here from memory, though I do not, of course, claim that the report is verbatim.

"Finding Pharaoh was an exciting experience for me," said my companion.

"It is true I was armed

to the teeth, and my faithful rifle, full of shells, hung over my shoulder; but my assistant from Cairo, Ahmed Effendi Kemal, was the only person with me whom I could trust. Any one of the natives would have killed me willingly, had we been alone, for every one of them knew better than I did that I was about to deprive them of a great source of revenue. But I exposed no sign of fear and proceeded with the work. The well cleared out, I descended and began the exploration of the underground passage.

"Soon we came upon cases of porcelain funeral offerings, metal and alabaster vessels, draperies and trinkets, until, reaching the turn in the passage, a cluster of mummy-cases came into view in such number as to stagger me.

"Collecting my senses, I made the best ex-

amination of them I could by the light of my torch, and at once saw that they contained the mummies of royal personages of both sexes: and yet that was not all. Plunging on ahead of my guide, I came to the chamber where we are now seated, and there standing against the walls or here lying on the floor, I found even a greater number of mummy-cases of stupendous size and weight.

"Their gold coverings and their polished surfaces so plainly reflected my own exalted visage that it seemed as though I was looking into the faces of my own ancestors. The gilt face on the coffin of the amiable Queen Nofretari seemed to smile upon me like an old acquaintance.

"I took in the situation quickly, with a gasp, and hurried to the open air lest I should be overcome and the glorious prize still unrevealed be lost to science.

"It was almost sunset then. Already the odor which arose from the tomb hadajoled a troupe of slinking jackals to the neighborhood, and the howl of hyenas was heard not far distant. A long line of vultures sat upon the highest pinnacles of the cliffs near by, ready for their hateful work.

"The valley was as still as death. Nearly the whole of the night was occupied in hiring men to help remove the precious relics from their hiding place. There was but little sleep in Luxor that night. Early the next morning three hundred Arabs were employed under my direction — each one a thief. One by one the coffins were hoisted to the surface, were securely sewed up in sail cloth and matting, and then were carried across the plain of Thebes to the steamers awaiting them at Luxor.

"Two squads of Arabs accompanied each sarcophagus — one to carry it and a second to watch the wily carriers. When the Nile overflow, lying midway of the plain, was reached, as many more, boatmen, entered the service and bore the burden to the other side. Then a third set took up the ancient freight and car-

ried it to the steamers. Slow workers are these Egyptians, but after six days of hard labor under the July sun the work was finished.

"I shall never forget the scenes I witnessed when, standing at the mouth of the shaft, I watched the strange line of helpers while they carried across that

THE GOLD-FACED INNER MUMMY-CASE OF QUEEN AHMED NOFRETARI.

historical plain the bodies of the very kings who had constructed the temples still standing, and of the very priests who had officiated in them — the Temple of Hatshepout nearest; away across from it Qbresh; further to the right the Ramesseum, where the great granite monumental lion face to the ground; farther south Medinet Abou, a long way beyond the Door of Medinet; and there the two Colossi, or the vocal Memnon and his companion; then, beyond all, some more of the plain, the line of the Nile, and the Arabian hills far to the east and above all; and with all slowly moving down the cliffs and across the plain, or in the boats crossing the stream, were the sullen laborers carrying their antique burdens.

"As the Red Sea opened and allowed Israel to pass across dry-shod, so opened the silence of the Theban plain, allowed the strange funeral procession to pass, — and then all was hushed again.

"When you go up, you will see it all spread out before you — with the help of a little imagination.

"When we made our departure from Luxor, our late helpers squatted in groups upon the Theban side and silently watched us. The news had been sent down the Nile in advance of us. So, when we passed the towts, the people gathered at the quays and made most frantic demonstrations. The fantasia dancers were holding their wildest orgies here and there; a strange wail went up from the men; the women were screaming and tearing their hair, and the children were so frightened I pitied them.

GOLD-FACED INNER MUMMY-CASE OF QUEEN AHMED NOFRETARI. PHOTOGRAPHED AT THE BULAK MUSEUM.

PROFESSOR MASPERO, EMIL BRUGSCH BEY, AND MOHAMMED ABD-ER-RASOUL. PHOTOGRAPHED AT THE MOUTH OF THE SHAFT, DEIR-EL-BAHARI.

"A few fanatical dervishes plunged into the river and tried to reach us, but a sight of the rifle drove them back, cursing us as they swam away. At night fires were kindled and guns were fired.

"At last we arrived at Bûlâq, where I soon confirmed my impressions that we had indeed recovered the mummies of the majority of the rulers of Egypt during the eighteenth, nineteenth, twentieth, and twenty-first dynasties, including Rameses II., Rameses III., King Pinotem, the high-priest Nebseni, and Queen Nofretari, all of which you have seen and photographed at Bûlâq, arranged pretty much as I found them in their long-hidden tomb. And thus our Museum became the third and probably the final resting-place of the mummy of the great Pharaoh of the Oppression."

Thus was the story of finding Pharaoh modestly told me by my friend who had displayed such enthusiasm and tact in securing for science what had puzzled science for so long a time to discover.

When we ascended from the tomb I grouped my companions at its mouth and once more caused the camera to secure a link of history.

Professor Maspero reclined upon the rocks at the right; Emil Brugsch Bey stood at the palm-log; and Mohammed was posed in front, holding the very rope in his hand which had served in hoisting royalty from its long-hidden resting-place.

Climbing the mountain across the valley I photographed the view on page 5 of the tomb terraces of Bibân el-Mulouk, showing the tomb of Sethi I., whose mummy is now at Bûlâq.

The next day the shaft was filled up again, thus closing the door of the empty theater, for the drama was ended, and the actors were gone.

I made a long Nile journey after that and photographed many a stone-cut "permanent likeness" of "the Michael Angelo of Egypt."

The profile of the southern colossus of the Great Temple at Abou-Simbel has all these centuries retained the beautiful expression left it by the Nubian chisel, and presents a striking resemblance to the photograph of the recently unfolded mummy of the great king. Of this unfolding the world has been told by almost every newspaper in it. When I was at Búlâq, all I could catch of the Sesostris face and form was as it appeared after the last neat work of the Inspector of Tombs had been finished. Since the unfolding, which took place June 1st, 1886, the camera of Brugsch Bey has enabled us all to "see how Pharaoh looked." Likewise, the report of Professor Maspero, giving the particulars of his removal of the wrappings, has ever since been a topic of conversation all over the wide world.

Only fifteen minutes were occupied in undoing the labor of many days by the careful embalmers. The kingly body had "reposed in peace" at least twice as long as was enjoined by the faith of Isis in order to secure immortality.

As recently as 1880 it was offered to an American traveler "for a reasonable bakhshish," but declined because its genuineness was doubted.

But no doubt now exists, for "in black ink, written upon the mummy-case by the high-priest and King Pinotem, is the record testifying to the identity of the royal contents." Then "upon the outer winding-sheet of the mummy, over the region of the breast," the indisputable testimony is repeated. The coverings being all removed by the careful hands of Professor Maspero, in the presence of the Khedive and other distinguished persons, Rameses II. appeared. Professor Maspero further reports that

"The head is long, and small in proportion to the body. The top of the skull is quite bare. On the temples there are a few sparse hairs, but at the poll the hair is quite thick, forming smooth, straight locks about five centimeters in length. White at the time of death, they have been dyed a light yellow by the spices used in embalment. The forehead is low and narrow; the brow-ridge prominent; the eyebrows are thick and white; the eyes are small and close together; the nose is long, thin, arched like the noses of the Bourbons, and slightly crushed at the tip by the pressure of the bandages. The temples are sunken; the cheek-bones very prominent; the ears round, standing far out from the head, and pierced like those of a woman for the wearing of ear-rings. The jaw bone is massive and strong; the chin very prominent; the mouth small, but thick-lipped, and full of some kind of black paste,

The parts being partly cut away with the fingers, disclosed some much worn and very brittle teeth, which, moreover, are white and well preserved. The nose, which had been lost, they seem to have been kept shaven, having life, but were probably allowed to grow during the long last illness, or they were kept grown after death. The hairs are white, like those of the head and eyebrows, but are harsh and bristly, and from root to tip a millimeter in length. The skin of hairy hairs, spotted with black. Finally, it may be said the face of the mummy gives a fair idea of the way of the

FIGURE OF RAMESSES II. — DISCOVERED BY THE FRENCH EXPEDITION OF THE GREAT PYRAMIDS, 1886.

living king. The expression is somewhat, perhaps slightly animal, but even under the somewhat grotesque suggestion of antiquity, there is surely to be seen an air of sovereign majesty, of wisdom, and of pride. The rest of the body is so well preserved in the body, but, in consequence of the nature of the mummy, its external aspect is somewhat. The body is no thicker than the mummy itself. The head is the same as the mummy; the hair is dyed yellow; the hands are small and dyed with lacquer, and the wound in the left arm, through which the embalmers extracted the viscera, is large and open. The legs and thighs are thick and the feet are small, and what is most remarkable, and dyed like the hands, with lacquer. The corpse is that of an old man, but of a vigorous and robust old man. We know, indeed, that Rameses II. reigned for sixty-seven years, and that he must have been nearly one hundred years old when he died.

On the same day that the face of the great Sesostris was unwrapped, the mummy of

RAMESES II. IMMEDIATELY AFTER UNWINDING. FROM A PHOTOGRAPH BY EMIL BRUGSCH BEY.

Rameses III. was also revealed and his identity established beyond question.

And now these old-time kings stand in the glass cases of the Bûlâq Museum, in as close companionship with Pinotem and Nebseni as they were when found in their sequestered retreat.

Once kings, princes, and priests, monarchs, tyrants, and oppressors, "equal with the gods,"—they now appear labeled and numbered as "antiquities," where all who desire may go and face them without fear.

When they were first borne to the tomb,

their frightened subjects cried to the gods for their entrance into immortality; and one of those gods was Rameses II., represented at Pithom in red syenite, seated in an arm-chair between the two solar gods Ra and Tum.

But when they were carried back to the Delta, the folds of sand which had for centuries covered their ancient city Zoan were being unwrapped by the spade and pick of the "Egyptian Exploration Fund," and their frightened descendants cried unto Allah—the God of Israel!

Edward L. Wilson.

FAÇADE OF THE BÛLÂQ MUSEUM, CAIRO, THE PRESENT RESTING-PLACE OF RAMESES II.

PHARAOH THE OPPRESSOR, AND HIS DAUGHTER, IN THE LIGHT OF THEIR MONUMENTS.

HE ancient Egyptians have placed us greatly in their debt by a science that surpasses ours. Even in the extravagant fancies of childhood over the tales and heroes of the Bible, we never dreamed that some day we might stand face to face with the figure of that "new king over Egypt" who "said unto his people, Behold, the people of the children of Israel are more and mightier than we: Come on, let us deal wisely with them, lest they multiply, and it come to pass that, when there falleth out any war, they join also unto our enemies, and fight against us, and so get them up out of the land";—of that father whose daughter not only spared the weeping babe in the little ark among the flags, but adopted the child, and he became her son, and she named him Moses;—of that royal patron who thus educated him for the public service as a prince in his own household;—and yet of that sovereign in whose breast the prejudice of race ran so deep that he sought to slay this Moses, his foster-son, the moment he heard the hand of the latter had lifted itself against an Egyptian.

Now, upon the reappearance of this venerable monarch on the stage of modern life, one of the questions suggesting themselves as soon as our first surprise is over, is, How does this man of renown bear out his portraits upon the monuments? Placing his actual features side by side with the faces of the numerous statues and sculptures by which he sought to immortalize himself, are the latter thus found true to their subject? Do they present faithful likenesses of this very physiognomy before us? Whatever it may be, the answer to this question will also have a material bearing upon the accuracy of the art of that remote period.

A second surprise lies in wait for us.

It has often been remarked how the countenance of **Rameses II.**, whether upon colossal monolith or mural carving, together with those of other members of the **Ramesside line** before and after him, can scarcely have been

purely Egyptian; and the conjecture has as often been hazarded that the type of expression they wear is obviously Semitic. Such a surmise has had for its foundation not only the narrow retreating forehead and the aquiline nose, but the long head from chin to crown and the entire cast of visage. The strange traits are limited to the Theban race or ruling

FIGURE TAKEN OF AN INDIAN IN EGYPTIAN COSTUME, BY THE LATE MRS. J. H. STUART, AND ENGRAVED BY J. H. STUART.

class, in contradistinction to the race of primitive inhabitants of the lower Nile valley.

Let us turn aside a moment to make this difference clearer by noting how the genuine Egyptians, having a better claim to be regarded as the natives of the country, looked. Though their fac-similes have been preserved in the monuments all along through the ages, yet some of the best of them have come down to us from the earliest times. One of these is reproduced in illustration 1, taken from a remarkable bust treasured in the Louvre. Whether regarded as a work of sculpture, or

2. PROFILE OF RAMESES II. FROM A PHOTOGRAPH OF THE MUMMY TAKEN UNDER PROFESSOR MASPERO AT BULÂQ.

as a success in portraiture, or as a creation almost endowed with life, it is a rare attainment in plastic skill and a rival to the highest art of any age. Professor G. Maspero sketches the prototype as follows:

"A great effort of the imagination is no longer required to recover the figure of an Egyptian of the time of Kheops, who contributed his part to the construction of the Pyramids: to-day we have merely to step into the Museum and look at the statues in the olden style there brought together. At the first glance of the eye we shall perceive that the artist who produced them sought to effect a strict resemblance in the modeling of the head and members after the person whom he desired to represent; and yet, neglecting the peculiarities of each individual, we may readily regain the common type of the race. The Egyptian . . . carried a head often too large in proportion to the body, presenting usually a spirit of mildness and even of instinctive sadness. The forehead is square, perhaps a trifle low; the nose short and round; the eyes are large and wide open; the cheeks filled out; the lips thick, but not reversed; the mouth, somewhat wide, bears a smile of resig-

nation and almost of suffering. . . . And, even in our own day, the simple peasants have retained nearly in every particular the likeness of their ancestors, and such a *fellah* regards with astonishment the statues of Khawrâ or the colossi of the Usertesens, which reproduce lineament by lineament, across the interval of more than four thousand years, the physiognomy of these old Pharaohs."

We have only to compare this precursory portrait of an Egyptian who lived and died under the Old Empire with the remarkable picture of Rameses II. (2) vividly repeating a photograph of his mummy's profile, in order to perceive the dissimilarity instantly. The two have not the first feature in common; in fact, the one is the opposite of the other at every turn, proportion, and measure. Clearly, the great Rameses by these presents is demonstrated to have belonged to the royal Theban race of foreign stock, just as the monuments indicated.

Can this foreign stock be traced back to its source? Until modern research began in Egypt the answer to such a question was a positive "No"; but not long since a monument came to light whose testimony is strikingly confirmed by our mute effigy of the king.

Among the ruins of Zoan Mariette Bey found a memorial slab of syenite, carved with a vignette on the upper part and inscribed on the lower portion, which at once became famous under the title of "The Tablet of Four Hundred Years" (3). The subject of the vignette is a scene representing Rameses the Great offering wine to the god Set in his human form and wearing the white crown, an officer also in adoration standing behind the monarch. The object of the stela is thus revealed to be a recognition on the part of the king of that

4. SPHINX OF ZOAN, BEARING THE PORTRAIT OF THE SHEPHERD KING APOPHIS. FROM "REVUE ARCHÉOLOGIQUE."

end upon the new monuments. According to the Salier papyrus, Apophis reared a temple to the god Sutekh; and we cannot doubt that our sphinxes are owing to the piety of this king toward the deity of his nation, nor can we refrain from the thought that the sacred inclosure which these monuments were intended to embellish was the site of the temple of Sutekh at Avaris [Zoan]. . . . And if, as every indication leads us to suppose, Apophis is the Pharaoh of *Genesis*, it was this Apophis who raised Joseph to the rank of a minister. And, these sphinxes of Zoan being contemporary with Joseph, can it be possible they have the signal honor of owing their origin to the son of Jacob personally, who would have the ordering of their execution?"

We are now ready to make the verification. The Tablet of Four Hundred Years and these sphinxes were discovered not far apart. Rameses the Great was the author of the tablet confessing descent from the Shepherds, and to-day we possess the features of the latter copied by the sun: the Shepherds were the authors of the Zoan sphinxes, to which they imparted their own faces. Let us compare the two, the profile of the sphinx, as above (4), with the profile of the king in illustration 2. They are parallel! Both have the same roundly retreating brow, the same arched nose, the same prominent lips, the same projecting chin, the same high cheek-bones, the same hollow cheeks — what have they not exactly alike? They are a startling match. An eminent scholar, the Reverend H. G. Tomkins, once wrote of the sphinx:

"What a front is this! full of gnarled strength. The brows are knit with anxious care; the full but small eyes seem to know no kindly light; the nose, of fine profile curve, yet broad in form, has its strongly chiseled nostrils depressed in accordance with the saddened lines of the lower cheek. The lips are thick and prominent, but not with the unmeaning fullness of the negro; quite the opposite. The curve is fine, the 'Cupid's bow' perfect which defines so boldly the upper outline: the channeled and curved upper lip has even an expression of proud sensitiveness, and there is more of sorrow than of fierceness in the drawn-down angles of the mouth."

But if we could throw the lion's mane of the sphinx around the head of the proud and lion-hearted though aged king, this description would apply equally well to him, would it not?

The family resemblance is so complete that one might be tempted to suspect the sphinx of really bearing the portrait of Rameses himself, rather than that of some Shepherd king. But, unhappily for such a suspicion, Rameses II. once, having found a similar sphinx at the site of Pithom or having removed one from Zoan, actually engaged in the discreditable work of appropriating it to himself by trans-

forming the head of the Shepherd into an image of his own (5). The alteration consisted mainly in removing the shaggy mane of the lion in order to substitute the "grand head-dress with spreading wings," a reduction which leaves the head too small for the body, while the outlines of the countenance remain almost untouched in the stolen monument.

However, Rameses II. did inscribe his name on the front of the Sphinx of Apophis at Zoan, which he did not otherwise injure, and upon other sphinxes of the Shepherds where he added the title "Friend" or "Beloved of Set"; while upon various monuments recently uncovered on the same site by Mr. W. M. Flinders Petrie, he is delineated in the act of offering to Sutekh, who in one instance wears the white crown as on the Tablet of Four Hundred Years, but in two instances is uncrowned and long-eared.

5. HEAD OF SHEPHERD SPHINX ADAPTED TO THE HEAD OF RAMESES II. FROM A PUBLICATION OF THE "EGYPT EXPLORATION FUND."

Such a verification is more than satisfactory. We are fully convinced that this tall king, so superhumanly towering as to be frightful to his enemies, rightfully belonged to the ruling rather than to the native race of Egypt; and, strange though it be, we allow his claim of blood-relation to those invaders, the Hyksos-Shepherds, whose expulsion from the Delta required the entire strength of the seventeenth Theban dynasty expended in a war of eighty years. Here lies the secret of that uniform, peculiar, superior cast of physiognomy running through all the countenances of the Ramesside line, a line ever famous for being uncommonly handsome.

And who were these Shepherds? whence did they enter Egypt? Such questions have confounded the wise ever since the revival of learning. The origin of the Shepherds has been referred to the pastoral ranges on the

6. RAMESES I. (FATHER, SETI I.) FROM A MONUMENT FIGURED IN BRILLIANT MONUMENTS, EGYPT.

east of Egypt, to the Negeb, to the land of the Amorites, to the coast of the Philistines, to the hill of the Jebusites, and especially to the cities of Phœnicia. But grave objections lie against all these conjectures; and the more the ethnic type of the race is studied, the farther north and east, into Asia, its original home is carried. Some Hittite monuments recently discovered show a remarkable approach to its general aspect, yet many of the heads of Assyrian kings a still greater coordination. Very striking agreements appear in some details of custom, such as wearing a profusion of hair and the fashion in which it is dressed, exhibited in the familiar representations of Nimrod strangling a lion, or the statue of the god Nebo. The latest verdict on these inquiries is that of a distinguished scholar whom America delights to honor, Miss Amelia B. Edwards:

"The question of the Hyksos type remains unanswered. It is neither Egyptian nor Ethiopic, nor Semitic. It bears a more Northern stamp. It reminds us that those early Chaldeans, who were driven out by the Elamites under Kudur-nan-khush, spoke and wrote a Turanian dialect, and that their blood was akin to that of the yellow races which we now call Tartar and Mongolian."

When the eighteenth dynasty came to an end with King Haremhebi, the royal line was extinct on the male side. So the nineteenth dynasty was founded by a warrior, Rameses I.; but he was a usurper, lacking in an essential qualification — royal blood.

His son, Seti I., was also a brilliant conqueror; but to the Theban priests and men of learning he, too, was unsatisfactory, because, in like manner, royal blood did not course in his veins, and because he bore the offensive name of Set. However, if, on the contrary, he was a scion of Shepherd stock, then

to us he is a curiosity, from the fact that the Hyksos features of Rameses his son must have descended through him, and in so doing left on him the typical marks of this mysterious race. How is it? has he got them too? Consult his portrait in illustration 6, and answer accordingly. Neither a long nor a second examination is required to perceive in his looks a survival of the Sphinx of Zoro on the one hand, and a prophesy of his offspring on the other. A brow reclining, a languid eye, a nose strongly arched, a mouth of almost voluptuous lips, a deep hollow beneath them that throws a round chin into accent, — all are there. He strikes involuntarily the same attitude of calm contemplation, or even pleasant reverie; but even in his style of wearing the hair he appears to attest that odd, superhuman mien of his pastoral ancestors. Though only an outline, this sketch has been chosen above many splendid examples of pictorial carving, for the sake of presenting features and not a scene. Some of the finest has relief in all Egyptian sculpture have Set I. for their subject and central figure, imparting the story of his life through the eye rather than through the ear, — artistic object-lessons fairly changing study into enjoyment. A late witness, Mamsien Ch. Blanc, testifies:

"Scared upon a round base of a column, we examined the oldest bas-reliefs in the world! Seti was present in the two temple of Abydos. His noble face, in some places and before, wild and proud, raised out from the wall and seemed to regard us with a gentle smile. A wandering ray of sunlight penetrated into the temple, and, falling upon the low silhouette of the uncoloured figures, gave them a relief and animation which was almost illogical."

However, so varied are our resources that to-day we are not dependent on ancient art for an acquaintance with this refined and worshipful parent of him who forms the object of our inquisitive study. The famous Seti, too, was found among the royal mummies at Dair el Bahari, along with Thothmes III. the illustrious, and Rameses II. the conqueror. And when his winding sheets of mummy cloth were unwound, and when, for the first time in so many long centuries, the light revealed those idiosyncratic features which of old inspired many beautiful reliefs in stone, the merciless camera was also turned upon them, and in that sort of picture which is notori-

7. SETI I. (SON OF RAMESES I.) FROM A MONUMENT FIGURED IN BRILLIANT MONUMENTS, EGYPT.

ous for never flattering nor ever detracting we have a proof of the very original himself (7),— a proof, by the way, of more than one kind; a proof which betrays the work of the bas-relief artists, showing how well or ill they ren-

E. TUAA, MOTHER OF RAMESSES. FROM LEPSIUS'S "DENKMÄLER AUS ÄGYPTEN."

dered their princely subject — and a proof of Ramesside blood. In neither of these lines will any one who makes the comparison require the help of hints as to points of conformity or affinity. Rather, the danger lies toward the opposite extreme. The casual examiner will be likely to declare, "Difference there is none. Why! this pretended Seti is merely another photograph of the Rameses mummy-head taken from another direction of view!"

But Seti shrewdly made up for his own deficiency in the nobility then dominant by marrying a princess of the last or eighteenth

dynasty, Tuaa by name. She was descended directly from Thothmes III. and Amenophis III. whose granddaughter she was; and the monumental records acknowledge her as "Royal Wife, Royal Mother, Heiress, and Sharer of the Throne." Her mask, as it were, in illustration 8, reveals another source whence Rameses, her illustrious son, derived some of his "classic type" of countenance, along with the whole of his royal blood. For a work of such high antiquity we are not prepared for a treatment so truly artistic, and productive of so startling an effect. How vividly that sharp profile contrasts with the adjacent background! It speaks for itself as preserving an exact appearance of a living being, with the utmost fidelity and delicacy. Nay, what trace of antiquity does it present? It is not too much to say that it marks a moment of Egyptian Renaissance which so closely approaches the Renaissance of art in Italy that, were its origin unknown, it might be mistaken for a product of that time.

Tuaa, however, was preëminently royal, not only in that her father was a king of the eighteenth dynasty, but in that on the maternal side, her mother, Tii by name, the queen of Amenophis III., was a princess in her own right. Her father was a powerful king, and her mother a notable queen, of Naharaina or Mesopotamia. This information is preserved upon a large scarabæus, executed under Amenophis, whose inscription, having the following legend (9), may be translated thus:

"The living Horus, the Strong Bull, crowned by Truth, The Lord of Diadems, establishing laws, pacifier of The Two Countries, great warrior, smiter of the Eastern Foreigners, King of the Upper and Lower Egypt. NEB-MA-RA, Son of the Sun, AMENOPHIS, the ruler of

The Thebaid, the Giver of Life: The Great Royal Lady TII, the living one; the name of her father was IUA, The name of her mother was TUAA.

Who is the wife of the powerful King,
His southern frontiers are to the Karui,
His northern are to
NAHARAINA."

In the record upon another similar scarabæus, of the same age, Tii, the living one, is called "the marvel, the daughter of the Chief of Naharaina." Of course we are curious to see how this marvelous princess held forth, if, perchance, the monuments have taken and saved a picture of such a "Great Royal Lady" from the land of Rebekah and Rachel and Leah. And *mirabile dictu!* they have. It is found among the portraits of the queens in the Tombs of the Queens, on the west of the river Nile over against Thebes, where her own chamber of sepulture remains intact, together with all its sculptures and paintings, unharmed by fire (10). The family likeness on the maternal

5. MARRIAGE RECORD OF AMENHOTEP WITH TI. FROM BUSTAN.

side, quite different from that of the Rames side line in respect of angularity, is here revealed with intensity. The nose, especially, is straight and pointed; the brow is high and far from continuing the slope of the nose, implying an intellect of superior order. Though her lips indicate a loving heart, she evidently possessed more of spirit than of gentleness; while the remarkably exact relations and equalities of her features must have made her not only a very attractive but an exceedingly beautiful woman. If Rebekah and Rachel were only half so fair as she, they were well worth a journey away to Mesopotamia to win. And, possibly, they were not unlike in another very different respect. It will be remembered that Rachel, on the eve of the furtive departure from Mesopotamia, stole away the images of her father's gods, which surely would be of no value to her unless she really trusted in them and meant to be true to their service in the land to which she was going. Ti, too, was equally loyal to her father's idols, and carried the gods of Mesopotamia to Egypt. Being a worshiper of Baal, her example revived the adoration of the sun, in the religious rites of the royal family at least, leading to endless discord and trouble. Though a wife of Amenophis III., her daughter married his son Khu-en Aten, who is famous for having discarded the gods of Egypt totally, and (under the influence of Ti?) for becoming a

fanatical worshiper of the sun's leamy disk. In the enthusiasm kindled by a face wrought in white marble and exhibiting a taste surprisingly æsthetic, recognized as that of Ti by Mariette (though not by Magiero) after she had reached the proportions of a matronly queen, Monsieur Charnay declares:

"When we stop to admire the beauty of Ti, as falling, we find ourselves immediately struck by her charm . . . by a whole treasury, an historical treasury, of which her exquisite personality is the source and inspiration, and by being, but the chief author of those religious fragments which have not perished and left a burning trace which has not yet disappeared."

Having thus traced the probable origin of Ramesse's ancestors on his father's side, by the aid of the Tablet of Four Hundred Years, back to Chabot, and the lineage of his mother, by the aid of the Marriage record of Amenophis, back to Mesopotamia, he might be regarded in respect to race as an Assyrian rather than an Egyptian, might he not? Are we aware that a verse exists in the Bible, reading,

"For thou with the Lord God,
My people went down thence, from Egypt to capture
there,
And the Assyrians captured them with chains;"

which always has been an enigma? Commentators, indeed, unanimously say the sojourn in Egypt is here contrasted with the captivity in Assyria; but this leaves the statement in the first clause abruptly suspended, and would characterize a carrying away into captivity incorrectly as an "oppression," while the very next verse (Is. 46: 4, 5) the discourse proceeds to turn from the Egyptian oppression to the contemporary Babylonian captivity in usual and precise terms:

"Now therefore, what have I here, with the Lord,
That my people is taken away for aught?"

10. THE MESOPOTAMIAN PRISONER. FROM EGYPT.

In Babylon the captives were treated as colonists and citizens, not as slaves, whereas the real "oppression" occurred in Egypt alone. It is impossible to resolve this enigma except by regarding the conception of the prophet as remaining in Egypt and referring to Egypt in both clauses of the verse 4, the last bearing out and explaining the first; and then, when the question is raised, How could the oppressor of Israel in Egypt be an Assyrian? the answer is ready, Our present investigation has already

11. ANUKHEH AND RAMESSES. FROM PRISSE D'AVENNES. "HISTOIRE DE L'ART EGYPTIEN D'APRÈS LES MONUMENTS."

shown. Isaiah well understood in what way Rameses the Great was an Assyrian in Egypt, and so did they whom he addressed.

And this first-born son of the union between Seti and Tuaa, because inheriting the double royalty of his mother, was instantly hailed as king, and recognized by a fastidious aristocracy as the future sovereign of the land; and not only as a royal but as a divine being. To the people at large he was the personal representation of the divine nature; they adored him, offered prayers to him, sang hymns of praise to him; his ministers addressed him in rever-

ent terms, his princes prostrated themselves in his presence, his wives really worshiped him. And he appears to have believed himself superior to men and even allied to the gods; for in such groups as that of *Abû Keshaiû*, or Pithom, he seated himself between two solar deities, Ra on the one side, Tum on the other, and made his own image larger than either of theirs! Indeed, he carried this vanity so far as to represent in certain sculptures Rameses as king burning incense before Rameses a deity. His very name signifies "Derived from Ra," nor does he hesitate to assume the titles "Son of Ra," "Son of the Sun." How naturally he cries out, "Where art thou, O my father Amen?" And he blushes not to put into the speech of the Supreme Creator such words as these, "Thus speaks the father of the gods, to his son who loves him, the first-born of his loins, I am thy father, I have begotten thee like a god; all thy limbs are supernal."

One expression of this popular conceit relates to his nurture in early life: he was regarded as having been nourished by the vestal divinity Anûkeh, whose maternal embrace, as disclosed in illustration 11, he enjoyed and reciprocated by a pressure of the hand, at the same time looking up into his benefactress's face with filial affection. For observe that the artist has with intention thrown into the features of the goddess that noble "classical" profile of his real mother Tuaa, retaining also in those of Rameses as much as possible of the peculiar mold he developed in after life; both, therefore, are living portraits. The execution of this exquisitely colored intaglio, upon a wall of the temple at Baît el-Walî, dates from the very days of Rameses; its tone is chaste, and its design is carried out to the minutest detail. Both in feeling and in art the original is an advanced attainment in Egyptian effort. It is a composition whose excellence kindles new enthusiasm as a longer study unfolds its merits. Though the bas-reliefs of this temple relate to the opening life and early wars of Rameses, manifestly in this scene, though returning from his first excursion very hungry and thirsty, he had not yet passed beyond a tender age. At first sight we may not be able to suppress a smile nor restrain the remark, Rather large for a babe! But, as the Egyptians would no sooner sketch their hero in the weakness of childhood than in the infirmity of old age, he is always upon the monuments attributed with immortal youth, beauty, felicity. Nor were the Egyptians alone in this sort of estimation of their idols: Josephus indulges in a similar vein respecting that infant brought up by Pharaoh's daughter:

"God did also give him that tallness, when he was but three years old, as was wonderful; and there was

12. AN EARLY PORTRAIT OF RAMESSES. FROM BRONZE RAMESSES.

nobody so impolite as, when they saw Moses, they were not greatly surprised at the beauty of his countenance, which was so remarkable and related to him that it detained the spectators, and made them stay longer to look upon him."

Even in boyhood the countenance of Ramses began to exhibit the cast of his father; and the instant we look upon any one of his early copies we recognize the shape and color of his mature life as in a bud the prophecy of the open flower. One of these early portraits is brought out in the next illustration (12). A royal uræus winds about the fillet binding a head-dress on the brow, from which on the left side depends that long artificial tress, recurved at the end, which every prince was bound to wear as long as his father remained still in the land of the living. Around the neck reposes a highly ornamental collar, in part composed of precious stones, the like of which apparently he never ceased to bear, if we may so judge from his next costume and that of his last portrait in this series. And the pelt of a panther, with its head resting on his left breast and one paw thrown over his right shoulder, half covering his tunic, marks the wearer as already a member of that sacred class of priests called *Sam*, more fully detailed in the next figure. All of which, however, fail to conceal the fresh round form of the lad, and the bright look, the happy expression breaking forth in every feature about to blossom out in the face of the Ramses of the future.

As soon as old enough, Ramses began to assist his father in every regal and ritualistic duty—sometimes holding the plate of offering, pouring the libation, pronouncing the invocation, or reciting the hymn of worship, while his father performed the sacred rites; at

other times, in order to learn the science of war, accompanying his valorous parent on military campaigns, and, at length, venturing forth alone to victory. In illustration 13 we behold him engaged in one of these services—pouring out a libation of wine—as set forth by a tablet in the Temple of Abydos, upon which Mr. Villiers Stuart declares "more care has been lavished than on anything else in the same temple; as a specimen of sculpture it is quite a gem." In the strength of youth Ramses stands erect before an altar surmounted with flowers, partly shaven as to his head, yet retaining that side lock which marks him still as a princely minor, and upon which he has beaded a golden clasp, a row of pearls, and a royal hoodlet. Beads encircle his neck, and an elaborate collar. Over his shoulder hangs a panther's skin, which only princes of a certain rank had the right to wear. A leopard-headed hawk secures the apron-strings, and the straps suspending a plate of gold upon which are inscribed the cartouches of the heir to the crown. In his left hand he grips a papyrus roll, containing, doubtless, the litany of his worship. But, dear countenance! How, at this early age, it involves all the elements that are to render it peculiar in manhood, in old age, and even after three and thirty centuries have rolled away,—transmitted mainly from the paternal line, the salient chin, the impulsive lips, a nose that would identify its owner quite as well as his name, and the extension of its outline over the brow at scarcely a different angle. But while the backward crossing-point is unmistakable, the forward relationship between the unchangeable features at Abydos and the veritable personage rendered equally unchangeable by the embalmers is also unmistakable.

13. RAMESSES AT ABYDOS. FROM MUSEUM OF LUXOR.

able, the only modification being due to the burden of many years.

When grown to man's estate and elevated to the throne, the king Rameses lost none of his individuality. This is finely developed in the head of one among his surpassing images,

unusual in figure and size, yet the nostrils are refined. The lips are rich in kindliness and vigor. A serious thoughtfulness seems to pervade the whole visage, as though the king were living over again some trying episode, with its fortunate deliverance, in his past ex-

14. RAMESES THE KING, AT TANIS. FROM LEPSIUS.

reproduced in illustration 14, now enriching the Museum at Turin, but obtained early in the present century by the Italian collector Drovetti at Tanis in all probability. It pertains to a sitting statue, which ranks as the best one that has come down to us in point of complete form, unblemished preservation, and genuine artistic skill. Even without the tell-tale cartouches of Rameses upon the pilaster at the back, we should be struck instantly by the distinction it conveys of its ancient original. He wears a military casque bearing the royal uræus, and holds in the right hand a crook, emblem of dominion. His large eyes betoken a large soul, a fearless purpose, and a consciousness of supremacy. While the nose is

perience. Shall we venture a guess as to the scene of that incident? Can this brave warrior ever cease to brood over that narrow escape he had in his conflict with the Kheta, afar on the banks of the Orontes?

"And not one of my princes, not one of my captains of the chariots, not one of my chief men, not one of my knights, was there. My warriors and my chariots had abandoned me.

"Thereupon I lifted up my voice: 'Where art thou, my father Amen? If this means that the father has forgotten his son, behold have I done anything without thy knowledge, or have I not gone and followed the judgments of thy mouth? Shall it be for nothing that I have dedicated to thee many and noble monuments? Behold, now, Amen, I am in the midst of many unknown peoples in great numbers. All have

united themselves, and I am all alone; no other is with me; my warriors and my charioteers have deserted me. I called to them, and not one of them heard my voice. The works of a multitude of men are nothing; Amen is better than they.

"And my voice found an echo in Hermopolis, and Amen heard it and came at my cry. He reached out his hand to me, and I shouted for joy. He called out to me, 'I have hastened to thee, Rameses Mer Amen. I am with thee. I am he, thy father, the great god Ra. My hand is with thee.'

"All this came to pass. I was changed, being made like the god Monthu. I hurled the dart with my right hand, I fought with my left hand. Not one of them raised his hand to fight; their courage was smitten in their breasts; then limbs gave way. I made them fall into the water, just as the crocodiles fall me. They tumbled down on their faces, one after another. Each one as he fell, he raised himself not up again.

A grove of palm-trees now flourishes where the city of Memphis, formerly a brilliant capital of Egypt, once stood. Out of all its magnificent structures or splendid monuments only a single example survives the others, either drowned by the inundation of the Nile or by its waters left behind during nine months in the year, or groveling, face downwards, in the mire of a pool during the remaining months. The *fellahs* call this sole remaining inhabitant *A'â el-Harel*, "The Father of Terror"; and every traveler to Egypt makes a pilgrimage to the spot to receive an impressive lesson of fallen greatness. It is one of those colossal statues of Rameses II. which its ambitious author scattered through his kingdom from one end to the other—not in sitting posture, as the last one considered, but originally standing erect, with face to the north, against a pylon of the great Temple of Ptah, of which not a vestige is to be found to-day. The surpassing element in this monolithic image is that of height, being about forty-four feet from end to end; though its grandeur of size is paralleled by a majestic grandeur of beauty and style. Again, as illustration 15 well shows, the head so teems with the authentic character of the individual that we cannot tire of admiring it. How very exact the relation of brow to nose! while the entire face presents just such a contour as, from the mummy, we should suppose the features of Rameses must have had in middle life. When the statue fell to the ground the upper part of the double crown, or *pschent*, towering above the head, was dashed away, and the feet were broken off; but everything else continues intact—uraeus, false beard under the chin, even down to the royal titles engraved upon a breastplate, and a papyrus-roll held in the left hand. At the feet diminutive images of a prince and a princess, one of whom lifts an arm as if raised in supplication, reaching to the knee, are supposed to recall the peril from fire at Pelusium to himself as well as to his wife and children, in commem-

15. RAMESSES THE KING, AT MEMPHIS. FROM THE TEMPLE.

oration of rescue from which, through personal bravery as well as presence of mind and prayer, he reared memorial statues of the whole family before the grand sanctuary in Memphis. As if contemplating this miraculous extrication, the stony face cannot conceal the gratitude and peace of the king upon his second deliverance.

Yet among these masterpieces of art from the days of the nineteenth dynasty, one, judging from the fragment persisting to our day, surpassed all others in a very rare element. In those thus far examined realism has been plain to be seen — the fruit of an aim to repeat an actual face not in the least degree departed from nor fallen short of through inadequate talent.

16. RAMESES THE KING, AT THEBES. FROM "DESCRIPTION DE L'EGYPT."

But in this one there are signs of the indulgence of a conception, together with an effort, while remaining faithful to the real, to express a dream of an ideal king. The result is the most beautiful face of Rameses that was ever produced by Egyptian genius. It graced a court in that transcendent monument raised to the glory of the great potentate, the Ramesseum at Thebes. From illustration 16 we may easily separate the two components, one the object intended to be duplicated with whom we are now familiar, retaining his smile of self-complacency, which, perhaps, always flitted around the lips of Rameses; the other a stamp

upon that face of superhuman symmetry, of spiritual delicacy, reaching out after, really catching, that divine nature and dignity which Rameses was believed to share. So successful were the authors of this statue in their design that, as late as our own century when the French *savants* reached it, they, looking steadfastly thereon, actually thought it the face of a god:

"One could scarcely represent divinity under traits which should better cause it to be respected and cherished."

From this fragment in its faultless chiseling and polish, we may only imagine what amount of labor must have been expended upon the whole colossus of rosy syenite. It was the choicest monument, probably, in the grand structure of the Ramesseum. How innocently the *messieurs* of the French Commission add,

"This *morceau* of sculpture deserves to be carried to Europe, in order to show to what degree of perfection the Egyptians attained in the art of cutting and finishing stone."

Presently this *morceau* was conveyed to Europe — to the Louvre? No; but to a hall in the British Museum! Compare this illustration, for a moment, with the full-face view, on page 10, of the mummied king. Is there any difference, aside from the contrast between the bloom of manhood and the emaciation of extreme senility? How many landmarks are common to both — the heavy eyebrows, the face broadest at the cheek-bones, the prominent nose, the excessive lips, the sharply jutting chin! The monument and the monarch agree beyond all anticipation.

Our series of representative portraiture of Rameses began with one made vivid by the aid of colors; it may, therefore, appropriately end with another made as brilliant as a painting by never-fading pigments. It occurs at Abû Simbel in Nubia, in the grotto or temple of Hathor. Of course, an illustration (17) in black and white cannot transmit any conception of those powerful tints which render the portrait as natural as life itself, and so perfectly real that you wait to receive some reply to your greeting, or expect the monarch to descend from the wall and welcome you to his royal abode. The surpassing quality here is an intense expression. He is older now, equally tranquil, but less gracious and more stern. His complexion is a deep coppery red; his eye is very long, its apple is black, its ball white, its lids overshadowing; the nose is Rameses' own, depressed at the end; while the mouth and chin are equally peculiar. His costume is a military one; a casque of cobalt-blue, enameled with studs of gold and ornamented with the uræus, is bound behind by streaming bands. A broad collar adorns the

THE QUEEN, MEREN-MUT, FROM THE TEMPLE OF KARNAK. FROM CHAMPS-ÉLYSÉES. MUSEUMS OF LONDON.

neck, variegated with circles and radiant points in blue, green, yellow, red, and black. The hue of his short-sleeved garment, crushed strawberry, has again come round into the height of fashion, and is rendered highly effective by dominos in black; you would readily imagine the king might have taken the pattern from Joseph's coat of many colors.

But what sort of grotto or temple or abode is this at which we have arrived? Here, certainly, the king can no longer complain that he is "all alone." The temple at Buṭ el Wali and the imposing Ramesseum are devoted to his glorious achievements; but here, on all sides, upon façade, walls, pillars, another figure is met with; another presence keeps him company; another regent reigns conjointly with him on the throne. This sacred abode is consecrated to Hathor, the Egyptian Venus, and the second personage who shares it with him is his beloved wife, the idol and ruler of his heart, Mer en Mut Nefer-ti. Miss Edwards has untold the *raison d'être* of the shrine, in most inimitable terms:

"The façade is a daring innovation. Here the whole front is but a frame for six recesses, from each of which a colossal statue, erect and life-like, seems to be walking straight out from the heart of the mountain (18). These statues, three to the right and three to the left of the doorway, stand thirty feet high, and represent Rameses II. and Nefer-ti, his queen. Mutilated as they are, the male figures are full of spirit, and the female figures are full of grace. The queen wears on her head the plumes and disk of Hathor. The king is crowned with the *pschent*, and with a fantastic helmet adorned with plumes and horns. They have their

children with them; the queen, her daughters, the king, his sons, subjects of his house hold, whose heads just reach the parental knee.

"The superb sculptures that cover the face of these battlements and the front of the porch are not half a foot deep into the rock, and are so large that they can be read from the island in the middle of the river. The tale they tell—such would be many varied turns of old Egyptian style upon the continuous within—is stupendous and interesting.

"Rameses, the Strong in Truth, the Beloved of Amun," says the same legend, "made this temple Abode for his royal wife, Nefer-ti, Great of Name."

"The legend which, after commemorating the title of the king, records that 'his royal wife who was like Nefer-ti the Beloved of Mut, constructed by him this Abode in the mountain of the Peak Wreath.'

"On every pillar, in every end of every passage, on the walls, even in the sanctuary, we find the names of Rameses and Nefer-ti 'complete and complete.' In this double dedication, and in the perpetual freshness of the style, our senses to almost dream of some event, perhaps of some marriage, the particulars of which are lost forever. It may have been a marriage; it may have been a wedding; it may have been a coronation, or a great festival. We are, at all events, that Rameses and Nefer-ti are living as long, united, that an imperishable record of their alliance which shall come as fresh and bright as they began would remain there to Amun. What name did not stand to them? We are that the queen was like, that the king was as his father. We share the story, and the glory of the glories of all centuries past. Even in those barren mountains there is stored to us a truth, from the shores of old romance. We feel that Egypt must pass this way, and that the ground is well hallowed where he tread."

In order to get a better view of this loving pair, let us separate the two statues at the right of the picture, or northern end of the façade, from the remainder, and enlarge them as much as possible. This is done in illustration 19. The two cartouches of Rameses the King stand over his head in the carving, and one of them above the head of each statue at its left; the single cartouch of Mer en Mut Nefer-ti falls in the middle of the pilaster just at the elbow of the queen, beneath her title "The Great Royal Wife," equivalent to "Royal Wife, Chief Lady of the land." Out in the sunlight the wound smile of the king returns, indicating a condition of happiness without alloy. Observe how remarkably this face, with the attire upon the head, coordi-

19. FACADE OF THE TEMPLE OF KARNAK. AT EL DOKKI. FROM CHAMPS-ÉLYSÉES.

19. TWO STATUES AT RIGHT OF PRECEDING FAÇADE. THE QUEEN MER-EN-MUT NEFER-ARI AND THE KING RAMESES II. FROM PRISSE D'AVENNES.

nates with both the style and the detail of the Ramesseum statue. Also, closely compare the two countenances of king and queen and note a very apparent kinship lying back of, older than, the relationship of husband and wife. Evidently the love that is now so warm and paramount in their lives is a continuation of an affection never less tender or strong.

Upon a pillar deep within the recesses of this grotto, on the left, we may find a more exact delineation of this fair queen, revealing the same secret. Just the same hieroglyphs identify her as the "Royal Wife, Great Lady Mer-en-Mut Nefer-ari." As illustration 20 indicates, she dons the plumes and horns and disk of the goddess to whom her home is dedicated; she wears a coronet; and, not unlike some fashionable ladies nowadays, she bears upon her head the livery of a bird, that of a vulture,—in her case, however, a symbol

of maternity. Above the beak of the bird rises a hooded asp, carrying a miniature disk of the sun, always the emblem of a sovereign. A large earring peeps from under a sun-bonnet, fringed with gold and falling around her shoulder. In her right hand she holds up a sistrum, or copper bow with cross-bars strung with beads, ornamented by a head of Hathor as a sign that she is a priestess of the highest rank or prophetess of peculiarly sacred character; while in her left she grasps a scourge as another sign of royal supremacy. In her outline the Egyptian artist manifestly tried to realize a beauty which he was never afterwards called upon to outdo: he has expressed a sweet grace, united with a force of character, quite sufficient to gain and to keep the affections even of a Rameses the Great.

A variant of her dedication of the temple to him reads, according to Mr. Villiers Stuart:

"To the sovereign of the two lands, Lord of Upper and Lower Egypt, User-Ma-Ra, Son of the Sun, Beloved of Ra, Lord of Crowns, Rameses Mer-Amen, his loving Lady, Queen and Princess Nefer-tari has built a temple in the locality of Abbû by the waters. Grant him life for evermore."

Throwing these epithets into a natural succession, "His Princess and Queen" at once, we may curiously ask, Does the first of these terms explain the romantic attach-

ment and offer the ground of exaltation to the last?

If so, the revelation is capable of a test which will either confirm or disprove it.

One step backward in her history would be a time when she had not yet assumed the title Mer-en-Mut, "Beloved of the goddess Mut," just as her liege-lord was proud to call himself Mer-Amen, "Beloved of Amen," and hisson Mer-en-Ptah, "Beloved of the deity Ptah." And such a period is readily recovered. Among the bas-reliefs of West Silsilis

20. RAMESES' ROYAL WIFE, GREAT LADY MER-EN-MUT NEFER-ARI. FROM LEPSIUS.

this same queen may be observed occupied with the pious task of offering sacrifice to certain divinities (illustration 21). Here she is announced to the world as the "Royal Wife," and the "Great Royal Wife, Lady Ruler of the Two Lands," etc., while her cartouch reads merely "Nefer-ari." Her insignia are essentially the same, the plumes, etc., of Hathor, a coronet, but no uræus, and now she holds a sistrum in each hand high above the altars, upon which libation-jars are standing. As a sistrum-player, *ahit*, and in the act of performing certain religious ceremonies before an altar, she again signalizes her membership in that holy order of priesthood to which only the wives and daughters of kings could belong.

Another step backward in her history would be a time when she had not yet attained the position of queen or the title of "Royal Wife," but was known simply as "Princess." Looking through the lists of royal daughters born to Rameses, among the troop depicted at Derr we find one little girl portrayed beneath the king, accompanied by his lion and about to dispatch a group of prisoners, who lifts her arms on high and holds a sistrum in one hand, who wears a coronet, and bears the name of "Nefer-ari." On the walls of the Great Temple here at Abû Simbel she also appears, beneath a similar scene, and is recorded as "Nefer-tari" by name: in illustration 22 is her picture.

At first thought it might seem, from the occurrence of Mer-en-Mut Nefer-ari in the company of Rameses offering sacrifice on one wall in the Great Temple, and the occurrence of these daughters on another wall of the same temple, that the queen was grown when the princess was young. But on second thought this objection disappears; for this troop of princesses is merely a

genealogical table, a duplicate of others at Derr and at Thebes, without reference to the queen, who is represented upon the walls of both these temples at Abû Simbel as she appeared at several other epochs in her life; and also for the reason that among these various princesses, all alike of about a twelve-year-old size, no less than a whole generation of years must be di-

vided up—they could not *all* have been exactly twelve years of age at once.

Let us estimate that the daughter of Pharaoh the Oppressor was not far from sweet sixteen when she found the little waif upon the Nile: at this time she was only the "Princess" Nefer-ari, and the Bible is perfectly accurate in referring to her as "Pharaoh's daughter." As Briggs believes, this occurred in the sixth year of Rameses' reign, who may then have been six-and-thirty years of age: we know that he had grown-up sons, who were assisting him in war, when he himself began to rule. On the other hand, votive tablets in our Hathor Temple, dating from the thirty-eighth year of Rameses' reign, would indicate forty-eight and sixty-eight as the ages of the royal couple when this sacred abode was finished and in constant use.

But in two or three or four or more years after her discovery of the ark in the flags by the river's brink, the "Princess" became the king's peerless consort, and at first was distinguished by no other than her former name, the "Royal Wife Nefer-ari"; but, presently, for some reason best known to herself, she added a second appellation, Mer-en-Mut, the basis of the Thermuthis (Thermutis) of Greek historians.

Here lies the key to the strange procedure of Josephus, who first styles her "Daughter," then calls her "Thermuthis," and finally describes her as Co-regent in the administration of affairs.

And this very singularly clears up the records of other historians hitherto obscure.

One of them, Georgius (Syncellus), calls Rameses "Amosis Pharaoh"—a close approximation, yet not a perfect echo, "Amosis" having lost an initial R in its transit across the sea and two thousands of years. Besides, he relates, "The Daughter of Pharaoh, Thermuthis who was also called Pharia." Ah! this, too, has a familiar accent,—"Pharia?"—yet something is missing. What can it be? Again across the great sea and a space of twenty centuries "Pharia" has lost an initial N: if Georgius's record were to read

21. RAMESSES' GREAT ROYAL WIFE NEFER-ARI.
FROM LEPPICUS.

22. RAMESSES' ROYAL DAUGHTER NEFER-ARI.
FROM LEPPICUS.

Nepharia, nothing would be wanting. Thus, according to this authority, the full name of Pharaoh's Daughter was no less than Thermuthis-Nefer-ari.

Another of them, Cedrenus, tells how the Daughter of Pharaoh was named "Muthidis," as well as Thermuthis, and "Pharēis." Of course, as before this, "Pharēis" is a reduced survival of Nefer-ari, while "Muthidis" stands as a fragment of Mer-Mut; and so in both combined we have represented about half of the long Egyptian designation Mer-en-Mut Nefer-ari.

Artapanus, also, was right, as far as he went, in saying that Pharaoh's Daughter bore the name of "Merrhis," which selects the other half of Meri-Mut. By putting the halves preserved by Cedrenus and Artapanus together, we get the whole of Mer-en-Mut after all.

23. HEAD OF PHARAOH'S DAUGHTER. ENLARGED FROM FIGURE 20.

any countenance, together with a charm as irresistible to us as it was to the king; and yet she exhibits no lack of intelligence, good sense, wit, or strength. She wears all the grace and majesty of a real queen: a marked refinement betrays her superiority in rank and race to everything natively Egyptian. The narrative of Josephus respecting the events which took place after Moses had ceased to be an infant abundantly exhibits Thermuthis as active and influential in the government as any queen could be. She certainly exercised the power of veto when, having brought the boy Moses to her father, saying she intended him to be heir to his kingdom, and the great Ramesses, drawing his daughter's pet close to his breast and playfully putting the royal diadem on the head of the lad, the latter audaciously dashed it to the ground and trod upon it with his feet, for which act of evil omen the sacred scribe, looking on, made a violent attempt to kill him on the spot — she snatched her darling away, and so saved his life a second time.

We shall also err if, from the standpoint of our better psychology, judicially condemning the relation here involved, we pronounce it inadmissible. We are in search of facts, re-

Unconscious of all our perplexity in regard to her identity, the Daughter of Pharaoh is silently waiting for recognition, in life-size and bold relief, upon the walls of Hathor's Grotto to-day (23). A gentler spirit never breathed from

gardless where they may lead; and we must judge the parties concerned by their standards and circumstances, not by ours. It is already admitted by Pierret, Lenormant, and others that Bint-antha thus became the queen she was; while Wiedemann asserts the same as true, not of Bint-antha only, but of Amen-meri-t and of Neb-taui also. But, if of these three daughters or only of one, why not of Nefer-ari as well? Reflecting a moment upon the reputed number of the progeny of this great king, one hundred and seventy,— half of whom must have been daughters,— an array unprecedented in the annals of Egypt, we see how difficult a matter it must have been to find royal suitors for the hands of the princesses. Rameses was at war with all the world within his reach until there was no king but himself in all his wide domains. Intermarriage was regarded as expedient by the lofty house of Egypt, as the true means of keeping its royalty pure and the family perfect. People in the olden times over there reasoned precisely as the daughters of Abraham's brother did, when their mother became defunct by crystallization into a pillar of salt. Isaac, by Abraham's express direction, and Jacob took wives from their own kindred; and when Esau preferred to go out of the lines of consanguinity and marry Hittite damsels, it was "a grief to Isaac and Rebekah." Besides, toward the end of Egyptian history the Ptolemies were famous for close alliances, and we think it not so very strange only because we have got used to the fact.

Rameses the Great was about thirty years old when he began to rule alone, and he reigned sixty-seven years. As Professor Maspero says in his report, "And so he ought to have been almost a centenarian at death." The Scriptures imply that the Pharaoh who had brought the Israelites under the yoke of bondage was sovereign on the throne when Moses was born, we may estimate, with Professor H. Brugsch, in the sixth year of his reign. After this, Moses had time for growing up to adult age, and for retreating into Midian forty years, according to the chronology in our A. V., ere he could return to Egypt with safety. Can there be, therefore, an undercurrent of irony in the words of the Bible where it reads, "And it came to pass *in process of time*, that the king of Egypt died"? Be this as it may, we have, also, the testimony of one profane historian, at least, who records of Sesostriis that, having lived to so great age as to lose his sight, he preferred to put an end to his earthly existence rather than allow it to be further prolonged. "This last act," Diodorus continues, "was admired by the priests as well as by the other Egyptians, as terminating life in a manner worthy the ac-

24. APOTHEOSIS OF RAMESSES II. FROM LUXOR.

tions of this king." Accordingly, the walls of his magnificent Ramesseum preserve a bas-relief depicting the apotheosis of this exalted scepter-bearer (24). He is seated as upon a throne still, and, already their equal, he enters the society of the gods, all of whom are engaged in inscribing his name upon the fruits of the Tree of Life. On the left sits Amen-Ra-Tum, the sun, the supreme deity, under the form he assumes in the lower world where the dead reside. On the right stands Tahut, having the head of an ibis, god of science and all knowledges, scribe to the assembly of the immortals. In the midst and facing the king newly arrived, stands Safeh, the "Lady of Writings" or god-

dess of letters, who, along with Tahut, carries in the left hand the emblem of perpetuity during millions and millions of years. The double royal cartouch of Ramesses II, appears directly over his head; and even in this outline drawing of his countenance the artist of more than thirty centuries ago clearly endeavored to trace the very profile which time has dealt so tenderly with and now in these last days has unveiled to our reverent gaze.

Even if his royal name had not been officially written by the high-priest Pinotem upon his cerements, we would have been able readily to recognize and safely to identify the Great Ramesses from his iconographic monuments.

John A. Wilson.

CARTOUCHE OF RAMESSES II. — KING OF THE UPPER AND LOWER COUNTRIES.

RIGHT on the top of my remark that the passion of love, or that simple passions of any sort, such as the plays describe, are not to be met with in Zweibak, comes the adorable spinster Phillis, accompanied by Amyntas, who has been in love with her for years. She is a really fine person,—a tall, full, blonde woman, with a coquetry which approaches philanthropy, it is so amiable, so vague and elevated. Her desire to please expands itself into a fine and gentle enthusiasm. She has a freedom and a strength of position which would be possible to no other than an American spinster. She is not emancipated, or peculiar, or anything that is unbecoming, but sits by her tea-table like Deborah of old under her palm tree; from this position, in which I have often seen her, she radiates her interest in mankind in general and the male portion thereof in particular.

Amyntas has been in pursuit of her for years, if that may be called pursuit, where she does not fly and he scarcely dares follow. The affair has reached a state of suspended motion. He is quite content to be near her, to listen to the sound of her voice, and to be conscious of her movements. Indeed, it is to be doubted whether her actual presence is necessary to him. I should think he might sit very comfortably in the same room with one of her old dresses.

. . . An American should not spend the years of his early and middle life in Europe. When Americans first come abroad, they are very much taken up with associations. These are often so attractive as to make them think they could never weary of such things. A day or two after my first landing in England as a youngster, fifteen years ago, I went with a college friend to the Haymarket Theatre. This was in the time before the hand of the improver had been laid upon that charming abode of Thespis. It was a dingy white-and-gilt old place, stodgy and full of draughts, still redolent of old comedy and of the days of the pit and "half price." We sat in the stalls in the second row from the orchestra, and were very near the actors. Our compatriot, Mr. Vezin, who was playing in "The Man of Airlie," did us the great kindness to wink at us. I wonder if he was sensible of the effect upon our young minds of his benevolent action. In an instant I felt

such "a man about town." I was one with the wits of Queen Anne, with Colley Cibber and Barry and Betterton, and the dandies of fifty and a hundred years ago. We were very happy.

The next day I went to a levee at St. James's Palace. A beef-eater in the dress of three centuries ago stood at a turn of the staircase, and, recognizing my black coat, motioned me in the direction of the *entrée*. I was vastly pleased by the man's deferential manner. His semblance was in some way familiar to me. I looked again and saw that it was Henry VIII., no longer proud and valiant as in Holbein's picture, but contrite in mind, much tutored by the lapse of time and the course of events, having fully adopted the view of the school histories regarding his own actions, and now doing homage to the spirit of democracy in the person of a Yankee diplomat.

But one cannot live on associations. One has but a single life and cannot spend that on traditions. Associations and traditions soon weary. I sometimes go and stay at the country house of an old lady who has known pretty much every European celebrity of the century and who has entertained many of them under her most hospitable roof. She likes to talk about them. At first it was interesting to listen; but it has come to bore me sadly. The kind old lady sits discoursing all day upon the past of these eminent people—to me, who am altogether interested in my own future.

. . . I begin to want a country badly. I have so long breathed foreign air as to have begun to wonder whether the atmosphere of my own land, like this, is made of oxygen and nitrogen, and whether our piece of ground has as much of the sun, the moon, and the stars as these countries. I am aware that my country is a great one, but I require in my exile an outward and visible sign of the fact. It has altogether too much moral and future greatness. I wish it had more ships of war and bands of music. I would give some tons of moral greatness and, as for the future, would throw in an eon or two, for one smart drummer-boy.

A year ago a United States ship of war visited the country in which the writer holds a diplomatic appointment. I accompanied my chief on a visit to this ship. We were met at the dock by a steam launch, commanded by a midshipman, a tall youth with delicate and distinct features and a complexion that suggested ague. He told us he was from south-

ern Ohio. The chief, who is a poet, said he looked like Nelson; a Nelson from the shores of the Miami seemed a funny notion; but he did nevertheless. I was expecting nothing and thinking of nothing when the launch reached a hole in the side of the black object we had seen in the offing. We ran up the steps to the deck, which had been hidden from us by the ship's high walls and which was alive with a numerous company drawn up in the smartest array; the admiral to the front, an extremely handsome old man, in uniform of navy blue and brass buttons and white waistcoat, looking very grand and clean and bright and "tarnation mad." (We should have been there before). There was a violent discharge of musketry. My senses were shocked by the sharp rattling reports. The deck swam blushing with ten thousand flowers. In the twinkling of an eye I had been taken, after long absence, to a portion of the territory of my own country. It was her music, from the guns of four hundred thronging brothers, which tore the morning air of that distant shore. It was her most sweet thunder which reverberated among those summer seas. I looked upward and beheld the flag floating supremely in its elemental blue.

I never dreamed they could make such a devil of a noise. The ship's company went through their manœuvres; and then we were shown over the vessel. There was something rather flattering to ourselves, who had been treated with such consideration in the "damn-your-eyes" manner in which the officers hissed their orders sidewise to the common sailors, while we, so to speak, strode on superlily over their prostrate necks. It seemed very professional and quite the right thing. The admiral asked us to dine with him in his cabin. He also asked the captain. It was particularly pleasant to see that the captain called him "Sir," similar instances of just authority and decent subordination being so rare among our countrymen. At dinner the admiral had several times told the colored boy who waited to fill my glass, which the boy was rather slow in doing. At length the admiral himself filled the glass, saying: "That boy is determined you shan't have anything to drink." The moderation and self-restraint of this impressed me greatly, when I knew that at a word he could have hanged the boy from the yard-arms.

The ship's company were again drawn up to take leave of the minister, who declared to the admiral when about to take the launch that it was the happiest day he had spent in England. As for me, I shall not attempt to describe the lively sentiments toward the grand old admiral I entertained at parting.

. . . I see by the papers that they have taken up the remains of John Howard Payne, the author of "Home, Sweet Home," and carried them to America, the expense of the proceeding having been borne by an American millionaire. Mr. Payne had a very nice grave by the side of the Mediterranean. Why not have let him stay there? To have taken him up after so long a time and to have carried him such a distance and then for a Washington glee-club to get around him and sing a part-song seems to me to have been of the nature of an indignity. If Mr. Payne was a man of humor and refined sensibilities, as he probably was, I doubt if such a free treatment of him would have been to his taste.

There is a notion at home that you may be allowed to do anything, if you will pay for it. And when a rich man wants to do something "graceful," it is difficult for the authorities to gainsay him, a rich man with us being a bigger thing than the Government of the United States. I trust that if any soft-hearted millionaire proposes to make a contribution to my traveling expenses, he will do so while I am in the flesh, and can come to such a nice place as this and spend it. It seems also that the Department of State made a somewhat considerable concession in this matter. There must have been occasions when a leave of absence of sixty days and the necessary time required for transit, with permission to visit the United States, would have been appreciated by Mr. Payne. But to speak seriously, of course if there were people who wished to move Mr. Payne and were ready to pay for the transfer, the government could hardly have refused to assist them to do so. A great department can hardly humor itself with the whims of taste in which an irresponsible itinerant like the writer may indulge himself.

My countrymen have recently displayed a great access of necrologic zeal. Some Philadelphians have made a determined effort to get possession of the body of William Penn, and as they are that sort of people who think there isn't anything you can't raise with a derrick, they are much surprised that their attempt should have been resisted. On the ground that Pittsburg was named after the elder Pitt, the Common Council of that city recently passed a resolution, requesting Lord Chatham to allow the remains of his ancestor to be removed there for interment. The great Lord Chatham said, "If I were an American, I would never lay down my arms!" By way of a tardy acknowledgement of this famous and magnanimous utterance, I now take this opportunity of saying, "If I were the Pitt family, I would never give up my grandfather!"

THE HUNDREDTH MAN.*

BY FRANK R. STOCKTON,

Author of "Rudder Grange," "The Lady, or the Tiger?" "The Late Mrs. Null,"
"The Casting Away of Mrs. Lecks and Mrs. Aleshine," etc.

XVII.

R. STULL did not go into the country with his family, for it was necessary for him to remain some time longer in the city, in order to give attention to several branches of his varied business which had been neglected when his mind and time had been so greatly occupied by the disturbances at Vatoldi's. But this occasioned no delay in the opening of his operations against the peace and welfare of Enoch Bullripple. He had no intention of doing anything in his proper person, and his presence was not at all necessary at the scene of action. Without allowing his motives to make any appearance whatever, he had engaged a competent agent to investigate the title-deeds and original surveys of the Bullripple farm; and he had found, as he had expected to find, that not only was the old man's tenure of his property a very uncertain one, having depended for its endurance principally upon the fact that no one had ever cared to investigate its validity, but that there was an equal doubt of legal ownership in regard to the farm which he himself had acquired from Mrs. People. Mr. Stull had reason to suspect this when he bought up the mortgages which eventually gave him possession of the farm, but the property came to him so easily he was willing to take the risks in regard to the title. Now it would serve his purpose very well, if, when the time came to push Enoch Bullripple to the wall, the old man could also see that Mr. Stull was being pushed. That would make it impossible for Enoch or his nephew to suppose that he had anything to do with the matter.

But Mr. Stull was an excellent manager and a shrewd business man, and he did not propose that the pushing he might receive should hurt him in the least. His present action was not entirely based on his desire to retaliate on the old farmer for the insults and injuries the latter had heaped upon him. If things should turn out as he expected, there was reason to hope that

there would be much profit for him in his proposed transactions. The lands in question were not worth very much, looked upon from an agricultural point of view, but it was possible that they might, otherwise, be very valuable. Iron ore in paying quantities had been found in various parts of this region; and Mr. Stull's observations had led him to believe that the rolling country about Cherry Bridge was as likely to contain iron as any of the places where it had already been found. It would please him very well to form a company and put up a smelting-furnace on some spot convenient to the railroad; but, before he did this, he would like to become the owner of as much valuable mineral land in the vicinity as he could lay his hand upon. If there should be iron on his own farm, he would be very willing to give up his present hold upon it in order to acquire another which would be firm and secure; and if the Bullripple property should contain the desirable metal, he would most certainly buy up that property if it should be forced into the market.

The agent selected to conduct these investigations was exceedingly well adapted to the work; and, had he not undertaken it, it is doubtful if Mr. Stull could have found any one to whom he would have been willing to intrust it. This individual was Mr. Zenas Turby, who lived in the county town not far from Cherry Bridge, where he engaged in a variety of vocations, most of which had some connection with the law. He collected debts, and took up any odds or ends of legal business which could be attended to by one who was not an actual lawyer. In the course of a long and intrusive life he had picked up a great deal of information, legal and otherwise, which frequently caused him to shine in the light of a useful man. There was one piece of business which most of his neighbors would have been very glad to see him engaged in, and that was an early attendance at his own funeral. But Mr. Turby had declined for many years to gratify this popular desire, and, although now over sixty, was so hale and hearty that the prevailing hope in his direction seemed likely to be much deferred.

Among his other accomplishments Mr.

Turby was skilled in the search for iron ore, and this helped in a great degree to make him unpopular. The farmers in this part of the country had no desire to profit by the discovery of ore on their property. The profit they received from the culture of the surface of their fields was as satisfactory to them as it had been to their fathers, and they did not wish to dig and blast into the bowels of their farms in the pursuit of what might or might not be concealed therein. There were a few who had been shown the errors of this conservatism, but the greater part of them still asserted that they wanted nobody prowling and prying around their farms looking for iron. Even if it should be found, there was at present no furnace in the neighborhood, and, consequently, no immediate demand for the ore; and, more than that, they were unable to rid their minds of their old-fashioned prejudices against allowing other men to come and work upon their lands.

Mr. Turby was very well pleased to take up this piece of business for Mr. Stull. There was gain in it, and, besides, all the fighting that would have to be done would be against Enoch Bullripple, and Turby liked that. For many years, and in various ways, these two had been pitted against each other, whenever occasion could be found for such pitting. Whatever one believed in politics, religion, or in regard to almost anything else, was doubted or denied by the other, and the fact that they were the two sharpest old fellows in that county was reason enough for their being very sharp against each other.

Hitherto Enoch had generally got the better of Zenas Turby, and the latter, therefore, was very zealous in an affair which might give him the upper hand — and a very hard and horny upper hand — of a man who had not failed to get him down whenever it had been possible.

The investigations regarding the title-deeds and surveys of the estates in question had been carried on at the county town, and Mr. Turby having made a satisfactory report upon these, it now remained to look into the iron branch of the business before Mr. Stull definitely determined how he would proceed in the affair. This made it necessary for Zenas Turby to visit the village of Cherry Bridge; and to Cherry Bridge he came.

It was on a rainy morning that Mr. Bullripple, mounted on a great gray horse which would have been plowing in the corn-field had the weather been fair, rode up to the village house of entertainment, and tied his horse under a shed. There were several men sitting in a large covered porch in front of the house, but the first person Enoch saw was Zenas

Turby. It cannot be said that in the mind of either of these men there ever arose a desire for social converse with the other, and yet, whenever they happened to meet, each experienced certain sultry emotions which were not unpleasant.

"You here, Zenas Turby?" said Enoch, as he took his seat in the one vacant wooden arm-chair. "Haven't seen you in Cherry Bridge for a good while. I thought, perhaps, that sulky of yours had broke down at last from your havin' forgot yourself and taken somebody in with you."

As he said this Mr. Bullripple smiled, and looked around at the other men sitting in wooden arm-chairs, most of whom being his neighbors returned him an answering glance of approbation of the little thrust he had given Zenas Turby.

The latter did not smile. He was a strong, heavily built man. His face was smooth-shaven, and the little hair he had on his head was curly and of a reddish, sandy hue which made it difficult to perceive whether it was turning gray or not. He wore a long black coat, and the rest of his clothes and his hat were black, and he carried a stout cane with a long curved handle, well polished by the use of many years. He did not need this cane, but always took it with him when he drove. On such occasions he used it as a prodder with which to remind his horse that time is money; and when walking he carried it as a symbol of authority and a punctuator of his remarks. Now he gave a tap upon the floor which might indicate the opening of a paragraph, and fixing his sharp blue eyes upon his old antagonist, he said: "It's all very well for you, Enoch Bullripple, to keep on talking about my sulky, for I expect there's been many a time when you've wished it held two instead of one, so that you might get a chance of using some other person's horse-flesh instead of your own, but I've lived long enough to know it's a sight better for a man that's got business to attend to to drive about in somethin' that'll hold himself and nobody else; so that wherever he goes he won't be asked to give somebody a lift who's too lary to walk, or too stingy to keep a horse. My sulky carries me about all right, but it won't carry nobody else, and this suits me very well, even if it does sometimes come hard on you, Enoch Bullripple." And the big cane came down on the floor, marking a period apparently very satisfactory to the speaker.

Mr. Bullripple grinned. "There's no man in this county," said he, "outside of a lunatic asylum that would see you driving by with an empty four-seated wagon and ask for a lift in it if he didn't have enough money in his pocket to pay you a little more than common stage

fare. And I shouldn't wonder if the reason you stick to a sulky is to keep yourself from the temptation of stagin' without a license."

At this two or three of the company laughed, and Mr. Turby frowned. But Enoch, not caring for any reply to this remark, continued to speak.

"But what brought you up here any way, Zenas?" he said. "'Tain't the time of year for collectin' bills. Did you come to look for iron? I've heard you've been goin' into that business."

Now nothing could have angered Mr. Turby more than this remark. Sneers in regard to his narrowness of disposition were not new to him, but he flattered himself that he always succeeded in keeping his business a secret until he chose to divulge it. But here, at the very first question, Enoch had hit upon the object of his visit to Cherry Bridge.

"Whether it's iron or gold or paper money, it's none of your business, Enoch Bullripple. That is to say ——" but here he checked himself. He wished to make it very much the business of the other, but that was a matter which must not now be touched upon. "All that I've got to say about iron is just this: that there never was a bigger fool than the man who'd go on plowin' and workin' his stony old fields and not get enough in any year to pay his honest debts, when all he has to do is to say the word and have a company dig iron out of his hills — and not hurt his fields and pastures nuther — and pay him fifty cents for every load of ore took out. But there are fools of that kind and plenty of 'em, who might live in comfort and send their children to school if they only had sense enough to let other people come and get out of their farms the only thing worth gettin' out of 'em."

"It's one thing," said Enoch, "to own land with minerals in it and to go to work and get them minerals and make money on 'em. But it's altogether another thing to have a man come that p'raps don't know no more about it than that p'inter dog, and dig here, there, and anywhere, on your farm, and then go off and say that there ain't iron enough on it to make a horse-shoe, and so spile your chance of sellin' a part of your land if a company ever did come along that wanted to buy it. Nobody wants a fellow huntin' for iron on his place who's got a report to sell to the highest bidder."

This was a hard hit, because a story had once been told that a farmer in the neighborhood of the county town had been urged by Mr. Turby to employ him to make a report on the mineral value of his lands, offering as a reason that it would be much better for the owner of a farm if the investigating agent had his in-

terests at heart instead of those of the would-be purchaser. As the country people of that region had an old-fashioned idea that a report should be a simple statement of facts without reference to the interests of any particular employer, this story thickened the cloud that for a long time had shaded Mr. Turby.

Zenas frowned and looked steadily at the floor. "I shouldn't think," said he, speaking slowly but very forcibly, "that a man that goes off on some sort of a shindy in the very busiest part of the year and leaves his farm to take care of itself and go to rack and ruin fur all he knows, ought to have anythin' to say about what industrious fore-handed people choose to do with their lands."

"A part of what you say, Zenas Turby," answered Mr. Bullripple, "is exactly right, and that is that you shouldn't think. Thinkin' is a business that you ain't suited for. There's a good many kinds of work that you can do first-rate, but you ought to get somebody else to do your thinkin'. You was just right when you said you shouldn't think."

At this there was a burst of laughter from the men in wooden arm-chairs; and Mr. Turby rose to his feet to make an angry reply. But he was not so quick of speech as was Enoch, and the moment the laughter ceased the latter, also rising, got in ahead of his antagonist, and remarked: "I haven't got no time to stay here any longer palaverin' about iron lands. But I'll just say this, Zenas Turby, that it's a mighty good thing when a farmer gets his place in such a condition that when he wants to go away for a while to attend to some other business, it can run itself."

XVIII.

MISS MATILDA STULL was very well aware that in her endeavor to get into the Cherry Bridge society she need not depend in the least on her mother. That lady was too glad to get away from the irksome and often embarrassing social demands of the city to wish now for society of any kind. Usually spending the summer at some fashionable watering-place, the quiet of this mountain farm-house gave her a sense of delightful repose she had not known for years, and she was entirely satisfied with the protracted absence of her husband, who, if he had been upon the scene, would most probably have insisted, as he always insisted elsewhere, that she should push to the front of whatever society she might find about her and make herself clearly visible as the wife of J. Weatherby Stull.

But the eldest daughter of the house felt that she was quite able to further her own interests in this matter, and, with this view,

she set out on a walk to see Mrs. People. When her father should return she knew that she would be obliged to take the horses and the carriage when she wanted to go about the country, but now it suited her purpose much better to walk. It was easier to meet people, and perhaps to stop and talk with them, when walking than in driving in the carriage. She looked upon Mrs. People as the only present thread of connection between herself and the Cherry Bridge gentry, and it was her intention to make that good woman understand that it was her duty to impress upon the mind of Mrs. Justin the importance of an early call upon the ladies of the Stull family, people of high position who had recently arrived in the neighborhood. She did not attempt to deceive herself with the notion that anxiety to make the acquaintance of Mrs. Justin was at the bottom of her intended action, but she freely admitted to her own consciousness that through that lady the acquaintance of gentlemen, often a most necessary adjunct in the enjoyment of country life, would probably be made.

She was yet some little distance from the Bullripple house, when she met John People, who was coming towards her on the narrow path through the grass at the side of the road. John was in his shirt-sleeves. He wore a broad straw hat, and on his shoulder he carried a hay-rake. His portly and upright figure appeared so well in this rural guise that Miss Stull could not help wishing for a moment that he were a gentleman disporting himself thus for his own pleasure, instead of being the son of that fat Mrs. People, taking a holiday from his restaurant, and working on the farm. Had she expected no other opportunities of male society during her country sojourn, Miss Matilda would have been willing to ramble over the woods and fields with the sturdy John, but, as she had a lively hope of doing something better in this line, she now looked upon him only in the light of a possible stepping-stone to some advantageous foothold.

"Good-morning, Mr. People," she said, "isn't this a beautiful day?"

John returned the salutation, and, taking off his hat, exposed to view his short yellow locks, as smoothly and evenly brushed as Miss Stull had ever seen them at Vatoldi's.

"Are you going to work in the fields?" she said presently, as the two stopped.

"I was going," said John, with an emphasis upon the "was" intending to indicate that such should not be his present purpose if Miss Matilda gave him an opportunity of remaining in her society.

Miss Matilda understood the intonation perfectly, and she hesitated for a moment be-

fore she spoke. If the mother should happen to be away it might be a good thing to take a walk with the son, and if she could derive no other advantage from the ramble she felt she could obtain from John some additional information in regard to the persons whose acquaintance she desired.

"Is Mrs. People at home?" she said, "and disengaged?"

"Oh, yes," said John, "and she will be very glad to see you. There's a lady in the house now, but I don't think she intends to stay very long."

"Who is it?" asked Miss Stull quickly.

"It is Miss Armatt, the young lady who is staying with Mrs. Justin."

"Oh, indeed!" said Miss Matilda. "I think I'll go in and make a little call on your mother. Good-morning."

John stepped aside to let her pass, and over his face there came a shadow of disappointment. He did not know exactly what he had expected, but, whatever it might have been, he was not going to get it, and he could not prevent the shadow.

"Won't you walk with me as far as the gate?" asked Miss Matilda with a smile. "I don't always understand the opening of these big gates."

She was not a workman who dropped her chisel and her saw into the dust and chips whenever she did not happen to be using them.

When, with another smile, she parted from John at the gate, she stepped very quickly towards the house. Miss Armatt's presence there was a rare piece of good fortune, and she was very anxious to arrive before that lady left.

Gay had walked over, across the fields, on an errand for Mrs. Justin, who was very glad to give her young friend an object for her morning walk, and thereby secure for herself the uninterrupted company of Mr. Stratford, who had come, by appointment, to assist her in the auditing of some complicated accounts of the association of which they both were members.

Mrs. People was about half through one of her long statements of facts when Miss Stull appeared, and she and Miss Armatt were made acquainted.

The visit of the two young ladies proved to be quite a long one, for Mrs. People was very anxious to talk. Miss Gay did not wish to leave until she had fully attended to her errand, and Miss Matilda did her best to make herself agreeable without regard to the passage of time. When, at last, Gay said that she positively must go, and her business had been promptly brought to a conclusion, Miss Stull discovered that she would not be going out of her way if she should walk over a field or

two with her new-made acquaintance, and so they set out together.

Mrs. Justin and Stratford, having finished their business, were standing together on the piazza, when the former exclaimed:

"Who's that coming over the field with Gay?"

Stratford looked steadfastly, but at first he was unable to answer. Presently, however, he recognized the young lady whom he had seen at the Bullripple farm, and in regard to whom he had made inquiries of Mrs. People.

"That," said he, "is a daughter of J. Weatherby Stull. His family are, at present, at his farm. But it seems rather odd that Miss Armatt should be acquainted with his daughter."

Mrs. Justin had never heard anything of J. Weatherby Stull that she liked. It was during the life-time of her husband that Stull had acquired his present possessions in the neighborhood, and Mr. Justin had been very indignant at the relentless manner in which Mrs. People had been driven from her home. Even if she had not looked upon the opinions of her husband as a guide for her own judgments, Mrs. Justin would have despised the things that Mr. Stull had done, and would have despised the man who did them. He had lived very little on his farm after it had come into his possession, and, while there, it had never entered into the mind of Mrs. Justin that it was possible for her to call upon his family. She had heard that they had again come into the neighborhood, but although much of her old resentment at the man's actions had faded away, she did not consider the Stulls as people with whom she had the least concern; and had almost forgotten that she had been told of their coming.

Mrs. Justin looked gravely at the two young women, who had now stopped and appeared to be talking quite earnestly. "I don't understand it," she said; "Gay never mentioned the Stulls to me, and that does not look like a recent acquaintanceship. They are evidently taking leave of each other, and yet it seems impossible for them to tear themselves apart."

This difficult deed was, however, accomplished, and while Miss Matilda turned back and took her way across the fields, Gay came hurrying homeward. She threw herself into a piazza chair and made her report, and it was plain enough to her hearers that she had been very favorably impressed by Miss Stull.

"She's a very nice girl," she said, "and as friendly as she can be. She intended to walk only a little way with me, but we had so much to say that we got almost here before we knew it. I wanted her to come in and rest herself, but this she would not do, for she seems to be very

particular about such things, and said it would not be proper for her to come here before any of this family had called upon her mother and herself. I suppose we ought to call on them as soon as we can," she continued, turning to Mrs. Justin. "I should think they would be very pleasant neighbors. And what I particularly like about Miss Stull is that she seems so much fonder of this country than of the fashionable places she is in the habit of going to."

Mrs. Justin did not immediately answer. She had an instinctive aversion towards anything that bore the name of Stull, but her conscience would not allow her to believe that the sins of a husband and father should be visited upon a wife and daughter, and she could readily understand that it would be a severe punishment to ladies accustomed to society to find themselves in a country place where their few neighbors would not associate with them. But it is possible that even these conscientious and kindly feelings would not have been sufficient to urge her to an early movement in the direction of her social duties to the new-comers had not a fresh motive come to their assistance. It was evident that Gay had conceived a liking for Miss Stull, and it occurred to Mrs. Justin that if her young protégée could form a friendship with one of her own sex and age, it would interfere very much with that friendship for Mr. Stratford about which she found that she still had some fears, notwithstanding the fact that she had persuaded herself that Gay's love for Crisman would be invulnerable against all attacks, whether made under the guise of friendship or any other sentiment.

She was glad to find that Mr. Stull was not expected to join his family very soon, and that his daughter did not suppose that, when he came, he would stay long.

Miss Matilda had heard that there had once been unpleasant feelings between her father and the Justins, and she was a young woman who generally knew what to say and when to say it.

If, therefore, there was but little chance of having anything to do with Mr. Stull, it might be well, so reasoned Mrs. Justin, to call upon his wife and daughter; and if the latter should appear to be the extremely pleasant young lady that Gay thought her to be, a companionship between the two would probably be a desirable thing. Gay's enthusiasm over this new acquaintance was very encouraging to Mrs. Justin. "That seems to be her natural disposition," she thought, "in regard to friendships, and it may not mean as much as I supposed it did."

She therefore determined that she would call on the Stulls. But when this decision

was announced to Mr. Stratford he gave it a cold approval. It was well enough, he remarked, to be courteous to new-comers, but he had always had a great dislike for Stull himself, and from the little he had seen of his daughter he did not believe that her companionship was needed by Miss Armatt. But Mrs. Justin laughed — was he such a judge of the nature of girls that he could tell their capabilities and qualities by a glance or two?

XIX.

A FEW days after the entrance of Miss Matilda Stull into the Justin field of view, Mr. Horace Stratford was driving slowly along one of the by-roads in the neighborhood of Cherry Bridge. It was about the middle of the afternoon, and he was starting out on one of those mountain drives with which he varied his fishing and walking experiences. He had allowed his horse to fall into a small jog trot; for a sensible man will not drive fast over the ordinary by-road of mountainous neighborhoods when his mind is fixed upon a subject entirely unrelated to roads and driving.

Mr. Stratford's mind was intently fixed upon the subject of his plans and purposes regarding the future welfare of Miss Gay Armatt. His desire to promote this welfare was as strong as ever, and his belief in the justice of his purposes was unshaken, but his hopes of their success were not quite so bright as they had been. He could not but admit to himself that while he had made upon the mind of this young lady quite as forcible an impression of the value of worthy male companionship as he had expected to make, that impression had not produced the result which he had hoped from it. Miss Gay, indeed, appeared capable of entertaining, at the same time, a true and earnest friendship for one man and a true and earnest love for another man. Thus, while he had gained for himself a most charming and sympathetic friend, Mr. Crisman still retained a loyal lady-love. Now while Stratford had no objection whatever to make for himself a charming friend, that was not the ultimate object of his carefully considered conduct towards Gay Armatt. If Mr. Crisman's hold upon the girl were not loosened, it mattered little to her future what hold any one else retained upon her.

"Perhaps," said Stratford to himself, "Mrs. Justin may be right, and the girl, having plighted her word, will stand to her promise through good or evil." Now this blind constancy was a quality of the soul of which Stratford did not approve. Adherence to the wrong under any circumstances was, in his opinion, unworthy of a true man or woman. If, by any

means, by comparison with other men, or by direct study of his character, Gay should discover that her lover was not the man she would have chosen had she deferred her decision until a little more age and a little more experience had given her better powers of judgment in regard to what a husband should be, then Gay was false to herself, and, in a manner, to Crisman also, if she married him.

If Mr. Stratford had been consulted on the subject of the young lady's action after she had arrived at this conviction, he would have advised a clear and frank statement of her change of view, coupled with a proposition that the engagement be set aside by mutual consent. He truly believed that if women were to do this when they found they had made a mistake in the plighting of their affections, not only would they avert a great deal of future unhappiness, but they would find the matter much easier than they had supposed. The lover might flout and rebel at first, but there were ten chances to one that, if the engagement had existed for any considerable length of time, he would have discovered for himself that the cog-wheels of the attachment did not run smoothly together, and that he would be willing to separate them before they had become worn or injured. It often happens that it is easier for an inferior man to sever his attachment to a superior woman than it is for her to disengage her affections from him. The material of the attachment in the first instance is of poorer quality.

But as Stratford was a sensible man, as has before been said, he did not expect any such severe moral action on the part of Gay Armatt. He had hoped no more than that she might gradually grow away from Crisman, and Crisman, consequently, dropping away from her, the engagement would come to an end without any particular effort on either side. But so far as he could now see, nothing of this kind seemed likely to happen.

"I have not understood," reflected Stratford, "the varied powers of sympathetic action which exist in the soul of this young girl. I came to her as a friend, and she has received me as a friend, whereas with Crisman she connects no idea but that of love. Consequently she has never made any comparison between us. If I wish to make an impression which shall be of the slightest use I must get her to compare me with her lover. At first I thought I was about to succeed in this, but now I have my doubts. She takes him for what he is, and me for what I am, and is perfectly satisfied with us both."

It may be said here that if Mr. Stratford's ability to read the mind of a young girl had been as great as his belief in the obviousness of his

superiority to Crisman, he might not have come to this conclusion. He was in the not unusual position of a person who doubts his ultimate success at the very moment he begins to succeed. Gay had already compared her lover, and that not favorably, with her friend.

Mr. Stratford was so absorbed in his important cogitations that his horse now fell into a contemplative walk, and the two proceeded very slowly.

"But," Stratford continued in his converse with himself, "I do not wish her to look upon me as a lover. In the first place I am not her lover in the least degree. And, again, I should consider it dishonorable, and entirely opposed to the spirit of my plan, even to appear to be her lover. I would like her to look upon me as a man who might be somebody's lover, and, in that regard, to compare me with Crisman. I would like her to say to herself, 'If some one may have the love of a man like Mr. Stratford, who will appreciate her tastes and her aspirations as he will appreciate them, who will sympathize with and help her as he will sympathize with and help her, and who will, in every way, offer her that sufficient companionship which he will offer her, why may not my lover be such a man?' If I can induce her to ask herself this question, and then seriously to consider whether or not Crisman is that sort of man, I shall be perfectly satisfied."

Easier were the tasks of tangled skeins and wind-driven feathers set by wicked step-mothers to forlorn princesses in the olden tales than was the task which this man now proposed to himself. And yet, without the slightest hope of the assistance of a fairy godmother, he steadfastly set his mind upon it.

"Upon my word," exclaimed Stratford, speaking out in very decided tones, and drawing up his horse to a full stop, "this is exactly like a story in a book! Only it is too improbable."

"What do you mean?" asked Gay, who had just emerged upon the road from a broad pathway through the woods.

"I mean," said Stratford, "that I was busily thinking of you, when you suddenly appear in the most unexpected manner, and in the most unexpected place."

"The place and the manner are simple enough," she said. "Mrs. Justin has gone to call on the doctor's wife, and after that she will drive over to the railroad station to pick up Mr. Crisman, and I thought I would kill the time until they came back by going out to look for rhododendrons, but it must be rather early for them, for I have only found this one little sprig."

And she held up a small cluster of the deli-

cately tinted pink and white blossoms for which she had been searching.

"It is not too early for them," said Stratford, "but you would be likely to find only straggling bushes along that pathway. It would be difficult for you to go where they are abundant. But why didn't you visit the doctor's wife?"

He would have been glad to extend the question, but saw no appropriate way of doing so.

"I don't care about going to see strangers," said Gay, "and as we called upon the Stulls two days ago, I thought that was enough ceremony for me in one week."

"If you will allow me," said Stratford, "I will say that, however much you may desire to escape from social boredom, it is not right for you to be wandering by yourself in these woods."

Gay laughed. "There is nothing in the world to hurt me except snakes; and, do you know, I have tried hard to see a snake, but never could. And now tell me how you came to be thinking about me."

"It may have been," said Stratford disingenuously, "that I had some premonition of your appearance, but I don't believe it. I could not even have imagined that you would be wandering in these woods by yourself, and, really, Miss Armatt, you ought not to do it. But I am delighted to see you, for now I shall ask you to take a drive with me. You will come, will you not?" And as he spoke he stepped down from the buggy.

Gay looked at him with a little smile upon her lips. "May I drive?" she said.

Her expression as she smiled and spoke, with her head a little on one side as she looked at him, was very youthful and very charming, for Gay when she slid down the straw-stack had not, as she supposed, left all her girlishness behind her. But Stratford was not altogether pleased. He did not wish to teach her to drive; he did not want to appear in the character of a tutor of any kind. But he answered promptly, "Certainly, you shall do as you choose; drive or be driven. All that I ask is the pleasure of your company."

"How easily pleased!" said Gay. And almost before he could touch her arm to assist her, she had stepped into the buggy.

"No," said Stratford, "you must not sit there. You must sit on the right side. If you drive you must do it properly."

"That will be delightful," said Gay, quickly changing her seat. "I do so like to do things in a regular way."

It did not altogether satisfy Stratford that Gay's pleasure in the mere act of driving seemed to exclude every other motive for

wishing to accompany him. But he put the reins into her hands, adjusting them with much care, and made her also hold the whip.

"In difficult driving," he said, "you should have the whip in your hand, in order that you may touch your horse if he hesitates."

"Is this to be difficult driving?" asked Gay.

"Yes," he said. "These rough country roads demand constant care and prudence, or you might find yourself in trouble."

"Oh, I like that!" said Gay, settling herself squarely in her seat, "and I am going to be awfully particular. Will you jump in?"

"Before I do so," said Stratford, "I must ask you to turn your horse to the right, and separate the wheels on this side. As you are the driver, that is part of your duty to your companion."

Gay laughed as she turned the horse rather more than was necessary on one side. "This is just perfect!" she exclaimed. "I feel as if I were managing everything. Are you quite comfortable, sir?" she added when Stratford had taken his seat.

"Go on," he said, laughing, but quickly exclaimed, "Not so fast! You will dash us to pieces against some stone or stump."

Gay drew in the horse, and then Stratford, in spite of his dislike of appearing on this occasion in the rôle of a teacher, proceeded to instruct his companion in the art of eluding the rocks, ruts, stumps, and fallen branches with which this seldom-used road was frequently obstructed. She applied herself with much earnestness to the difficulties of her task, but Stratford, desiring to put an end to this soul-absorbing occupation, which did not suit his purposes, and must, eventually, tire his companion, soon directed her to turn into a road in the woods which would shortly lead into the highway.

"You should have told me to beware of these branches," he said, as he pushed aside a protruding bough. "To be sure I saw them myself, but it is the driver's place to give warning of such things."

"I don't take much care of you, do I?" said Gay, turning around and looking up into his face with a glance of laughing kindness. "I ought to manage things so that you would never have the least bit of a brush or a bounce. There now!" she cried, as a sweeping branch took off her hat, "I was thinking so much of you that I forgot myself. Whoa, sir!"

Stratford jumped out and picked up the hat, and when he resumed his seat Gay requested him to put it on for her as her hands were so full.

"And I am going to ask you," she said, as Stratford placed the hat on her head, and ad-

justed, not very awkwardly, an elastic band beneath the thick coil of hair, "if you won't hold this whip until we get out of the woods. It is really too much for me to have to attend to the reins, the whip, the stumps, the bushes, and you."

When they turned into the broad open road Gay had the pleasure of a mile or two of good rapid driving. During this period of delight they met an open carriage, drawn by two horses, driven by a coachman, and containing a lady. Gay was so much occupied in keeping her horse exactly midway between the right-hand side of the road and the left-hand wheel of the other vehicle that she could do no more than give a little nod as she swiftly passed the carriage.

Stratford took off his hat, and then remarked to Gay that it was a pity Miss Stull had to drive about the country by herself.

"Yes," said Gay. "Her mother doesn't care to be out-of-doors, and she doesn't like to have her younger sisters with her. She said she would come to take me to drive, and perhaps she is now on her way to our house."

"Do you wish to turn back?" said Stratford.

"No, indeed," she answered. "That was the nearest supposition of mine. And besides, even if she does want me, why should I slight your invitation for one from her?" And she gave the horse a little touch of the whip of which she had again taken possession.

Gay's prompt decision was a very gratifying one, but Stratford could not help asking himself if her preference for his company was not due, in some degree, to the fact that she was driving.

Presently he made a proposition. "How would you like," said he, "for me to take you on a mountain drive? It will be a novel experience for you."

"I shall like it ever so much," said Gay, "and if you want my seat I am quite ready to give it up, for this tight rein driving has begun to tire my wrists."

"In the work we have before us," said Stratford, "I shall certainly want the driver's seat."

They now stopped at a gate by the side of the road, and Stratford having opened it, Gay drove through, and then he took the reins. They passed at a good trot along a cart road which wound through a field of young corn, and leaving this by another gate they emerged upon a wide stretch of grassy hillside, interspersed with bushes, rocks, and trees. They skirted the base of the hill, following a track that gave some indications of being a road, and which, by a series of gentle ascents, brought them to a forest on the side of a line of low mountains. Here Stratford turned into a wood-road which for some time led them

steadily upward. At a point with which he seemed very well acquainted he turned boldly into the woods, and wound in and out among the trees, which here being principally pines were little encumbered with underbrush, until he emerged upon the open mountain-side, where could be seen no track of wheel or hoof.

"You did that splendidly," said Gay. "I can't imagine how you dared to drive right in among the trees."

"I have been through that way before, and knew I could find a free passage. And now, my lady, I want to warn you that we are going to leave everything which resembles civilized driving. Do you think you shall be frightened?"

"I am sure you will not take me into any dangerous places," she said.

"There will be no danger whatever," he answered. "I shall go nowhere where I have not driven before; and although we shall pass over a great deal of shelving ground, I assure you that we shall not upset."

"If you say it is safe, I am perfectly satisfied," said Gay. "Please go on."

Stratford now proceeded at a steady walk along a slight terrace upon the mountain-side which afforded a very good roadway. To the left the vast forest stretched upward, while to the right lay a long green valley closed on three sides, and utterly wild and uninhabited. Very soon they rounded a turn in the mountain-side, and here the terrace disappeared. The surface of the ground, however, was diversified by rounded knobs and horizontal shelves of projecting rock, and the general incline, even in the smoother places, was not great.

Around and over the inequalities of the ground Stratford steadily made his way, taking advantage of every favoring surface; but, in spite of his carefulness, the buggy sometimes tipped very much to one side.

"You are sure we can't upset?" asked Gay.

"Quite sure," Stratford replied. "It would be extremely difficult to overturn a low-hanging vehicle like this, and everything about the buggy and harness is strong and intended for rough work."

"It is delightfully exciting," said Gay, "and I don't intend to be afraid. The view is getting better all the time."

"When we round that next point, just beyond us," said Stratford, "we shall have the view I brought you here to see. It is different from anything else in the neighborhood."

Having reached the point indicated, Stratford stopped, and they looked out on a scene of solemn grandeur. Below them was a deep and vast ravine, through which a dark river of tree-tops seemed to run into the valley they had first seen. Beyond this ravine rose a

heavily wooded mountain, and to the right of that, and back of it, stood other mountain peaks, purpled by the distance. Still farther towering high on the left, its eastern side now dark in shadow, stood the loftiest mountain of them all, looking down upon its lower brethren with a certain stern solemnity, while between it and the nearest peak Gay could see, far, far away, a line of light-blue mountain waves against the sky. For a few moments she sat without a word, and then she exclaimed:

"What magnificence! I never knew we had such mountains near us!"

"They are the same mountains we always have in view," said Stratford, "only we are on a point where we can see between their broken lines, and not merely look up against them as we generally do."

The spot where they had stopped was the most available one in the vicinity for a mountain view, but the ground was very sloping, and even if they had had plenty of time before them, Stratford would not have taxed the patience of his horse by requiring him to keep a stationary position there very long. After devoting some minutes to Gay's intense enjoyment of the scene, he told her they must now turn round, and go back; and as this turning round on the mountain-side might excite nervousness in the mind of a lady he proposed to Gay that she should get out while he performed this feat.

"Are you going to stay in?" she asked.

"Of course," he answered.

"Then so am I," said Gay.

Stratford made no further remark, but driving upon a projecting knoll, he backed the buggy up on a shelf of rock behind it, and turning the horse, drove down again to the spot where they had been standing. He knew what he was about, and his horse was perfectly trustworthy; but the knoll was very small, and the downward view from the outer border of it was likely to give one a good idea of the precipitous.

Stratford drove a short distance along the mountain-side, and then he drew up his horse. "Now," said he, "I am going to give you your choice. We can either go back the way we came, which you know is a long road, or I can drive down the mountain-side, which is not very steep just here, and when we reach the valley we shall find a wood-road which will lead us to that low hill, over there. Having crossed that, we shall soon find ourselves upon one of Mrs. Justin's farm-roads which will take us directly to the house."

"Oh, let us go that way, by all means!" said Gay. "It must be ever so much nearer, and after what we have done I am ready for anything."

"Very good," said Stratford; and he began the descent of the trackless mountain-side. He did not go directly down, but wound along in a serpentine way among the rocks, low-growing bushes, and over occasional stretches of coarse grass, which would sometimes have proved difficult of passage had not the yielding mold given a sure foothold to the horse. Gay was very merry over the varied contingencies of this novel drive, although she could not refrain from some starts and exclamations when they found themselves going straight down some short steep incline with the horse so far beneath the buggy that there seemed to be danger that the vehicle with its occupants would double over upon the steed. Once when the horse, thoroughly well trained in the business of holding back, actually sat down on his haunches, Gay gave a little cry and seized Stratford by the arm.

"Oh!" she exclaimed, instantly relinquishing her hold, "I must not do that or I shall hinder your driving."

Stratford was not afraid of any interference with his driving, but he was a conscientious man, and essayed no unnecessary slopes for the purpose of encouraging an intuitive reliance.

When they reached the valley, and had struck the wood-road, now almost overgrown, which led through a narrow stretch of forest, Gay gave a sigh of relief.

"I can't deny," she said, "that it is a comfort to feel that the buggy-wheels and the horse's feet are on a level with each other. But I would not for anything have missed that mountain drive! It had more of delightful adventure about it than anything that ever happened to me. But I would not have allowed any other man in the world to drive me where you drove me."

"And let me say to you," said Stratford, turning towards her, "that I know no other woman than yourself whom I could have trusted to be brave enough to trust me absolutely and entirely."

"I like to hear you say that," said Gay, with an expression that could not be mistaken for anything else than honest earnestness.

So far, although these two had spent a good part of the afternoon together, they had had but little conversation except that which had been called forth by the unusual character of the surrounding circumstances, and this condition of things Stratford thought had lasted quite long enough. He certainly did not regret the circumstances, because they had pleased Gay, and had brought out in a strong light some interesting points in her disposition. But now he was glad that the rest of their trip would be uneventful.

"You are pleased, then," Stratford said, "that I think well of you?"

"Indeed I am!" exclaimed Gay. "I am a great deal more than pleased. In you know," she continued, "that it seems very strange, in fact, it is absolutely funny, when I think in what a different way I regard you now from that in which I looked upon you when I first knew you. I don't mind telling you that I liked you ever so much from the first day. Then I used to wish that you were my father, and to think that it would be perfectly charming to have such a father, entirely forgetting that you did not begin to be old enough to be a father to me. After that I wished you were my brother. But that did not last very long, for if you analyze the relationship of a brother, which I have done, having a very good brother who is a professor in a college out West, you will find that he is wanting in some of the varied qualities of companionship; at least that is what I discover in my one specimen. Now in you I find no want of the kind."

"Am I to understand," said Stratford, "that you have analyzed my character?"

"Indeed I have," she replied. "In fact, I have done so two or three times."

"And what is the result?" he asked. "And in what light do you now regard me?"

"The result is," said Gay, "that it is impossible to place you in any class. I tried it and utterly failed. So I am going to let you stand all alone, by yourself."

Whatever of approbation there was in Gay's words or manner, there was nothing to indicate that she had ever thought of putting him into that class of men, who, not being fathers or brothers, might, upon occasions, make love.

"Do you analyze everybody?" he asked.

"Oh, no indeed!" said Gay promptly. "Only a very few persons. You more than anybody else."

"Am I then so very difficult to understand?"

"I do not think you would have been," said Gay, "if I had known you a long time, and had, in a manner, grown up with you; but, you see, you came upon me so suddenly and swiftly, and I have known you so fast, if you understand that, that I had to look very closely into the matter in order to comprehend it all."

"And do you comprehend it?" he asked.

"I think so," said Gay.

"And are you satisfied?"

"Perfectly," she answered.

Stratford was not perfectly satisfied. "I wish," said he, "that I could have been put among those persons who do not need to be analyzed."

Gay turned upon him suddenly. There was a little frown upon her brow, but when she spoke she could not help smiling. "You are

dreadfully grasping," she said. "Here I have been putting you up higher and higher, on a loftier pedestal every time, and yet you are not satisfied."

"Pardon me," said Stratford, "but if you had ever analyzed yourself you would not be surprised that I am hard to satisfy."

"Now I wonder what that means!" said Gay. "Are you going on developing and changing, so that I shall have to analyze you again?"

"I hope you will not do it," he answered quickly, "if there is any danger of my being placed on a lower pedestal, or perhaps being toppled over altogether."

"Don't you be afraid of that," said Gay, involuntarily laying her hand upon his arm. "And I'll tell you one way in which I think of you. I have a feeling that if you were to ask me to do anything I should instantly go and do it. What do you think of that, sir?"

A thought had come with much promptness to Stratford, and he had said to himself that if he could thoroughly believe what Gay had said, he would impress the seal of happiness and success upon her life by instantly demanding that she should give up the man who would be to her like a worm at the root of all to which her ardent young soul looked forward. But he did not believe her, at least to such an extent, and he kept this thought to himself.

"You do me the greatest honor," he said, "by placing such trust in me; and I wish I could tell you to do something which would make you happy for the rest of your days."

Gay turned and looked at him with an expression of inquiry which seemed somewhat foreign to her face, for her desires to know were generally promptly expressed in words. But now she said nothing, and, turning again from Stratford, sat quietly looking out before her.

They had now crossed the valley and had reached the top of the rounded hill upon the other side. The day was drawing to a close, and in this exposed position the evening wind came fresh and cool upon them. Gay's dress was thin, and Stratford, without remark upon the subject, stooped forward, and drew from under the seat a light woollen lap-robe which had hitherto been unneeded. This he placed around Gay's shoulders, carefully arranging it so as to protect her well from the somewhat chilly mountain breeze.

"Thank you," said Gay. And then she went on with her thinking.

Among the many things which came into the mind of Stratford on their homeward road was the conviction that this mountain drive had occupied more time than he had expected it would, and that Crisman must have arrived at least an hour ago at Mrs. Justin's house. He wondered if Gay was thinking about this, but, if so, she certainly manifested no anxiety upon the subject. Comfortably wrapped up, with her hands folded under her improvised shawl, she nestled quietly in her corner of the buggy as if she were perfectly satisfied with everything that was.

AMIEL.

(THE "JOURNAL INTIME.")

A FEW there are who to the troubled soul
Can lay the ear with that physician-art
Which by a whispered accent in the heart
Follows the lurking treason that hath stole
Into the citadel; — a few whose scroll
Of warning bears our safety, is a chart
Of our unsounded seas, and doth impart
Courage to hold the spirit to its goal.

Of such is Amiel, lonely as a saint,—
Or as an eagle dwelling on peaks, in shade
Of clouds, which now he cleaves for one wide look
At the green earth, now for a circle faint
Nearer the sun. Once more has Truth betrayed
Secrets to Sorrow not in the sibyl's book.

Robert Underwood Johnson.

AMONG THE APACHES.

AMONG the few great Indian tribes that cover vast areas of land and are so numerous in population that they are divided into many petty clans, we find the Apaches of the south-western part of our country holding no small place.

The Apaches are divided into no fewer than seven principal clans, which acknowledge no

common chief or chiefs, and have but little sympathy in common, even warring against one another under the stimulus of bribe,—the pitiful pay of a soldier often being sufficient to ally them with their common enemy, the white men, against any of their brothers in blood.

The word *Apache*, converted back into its own language, signifies *people*, and is synony-

mous with many tribal names among savage nations,—as *Lakota* or *Dakota* with the Sioux, and *Inuit* with the Eskimo.

The first conquest of the Apaches by civilization, imperfect as the conquest was, came from the incursions of the Spaniards who had overrun old Mexico. It was more of a peaceful conquest than those old Castilians were wont to make, much of it being, through the medium of the Spanish Jesuits, of a religious nature, and so early was this conquest that Santa Fe and Albuquerque, long considered frontier posts, claim priority over St. Augustine, the first city of the Atlantic. One Cabeza de Vaca appears to have been their first military conqueror, and they soon recognize that in him there did not exist in cruelty and tyranny another Cortés or Pizarro. Nor is this comparison wholly our own, for it is affirmed that the Apaches, singular as it may seem, knew of the name and deeds of Hernando Cortés, probably through intertribal traditions, and picture him

YUMA APACHE AND FAMILY BUILDING A HOUSE.

alongside of de Vaca much to the detriment of the former. In fact, it was explained to me that Cabeça de Vaca, meaning a cow's head, was but the Spanish translation of the Apaches' name for the first soldier among them, and was thus given because the feast of the cow's head was then held in reverential esteem.

From Spanish rule, with the liberation of Mexico, they passed under the new government, and after the Mexican war with us the resulting boundary ran ruthlessly through the heart of their country, paying less attention to them than to the barren lands which it divided, and which for untold ages had been their home. Nor did the thin sabulous strip known as the "Gadsden Purchase" do more than throw the preponderance of the great tribe upon our shoulders.

The diplomatic Apaches were keen enough to see the new international relations, especially as it bore upon them as a people whose reliance for subsistence, arms, ammunition, and clothing rested in no

small way upon their success in raids upon the white people; and from this standpoint they oscillated in friendship or enmity from one side of the border to the other with an alacrity that should rank them high among the diplomats of fame. On one side hung high the fair flag of truce, and on the other, as at half-mast, the black standard of no quarter; and with such deadly and cruel effect was this alternation made, that we saw the humiliating spectacle of two civilized nations, claiming rank among the nations of the world, sitting in solemn conclave to devise a common plan that would annihilate a batch of breech-clouted bandits whose whole numbers would not have made the hundredth city in either land, and to do this surrendering the highest prerogative of national sovereignty — the sacredness of their soil — to the soldiery of the other. Once Victorio, a presumptuous and daring chief of Apache land, dared to flaunt the three hawk feathers of his lance in the faces of the eagles of both the North and South; and all conversant with Indian history know how that chief met his tragic death, after being driven weary, exhausted, and hungry across the boundary line into the arms of the Mexican soldiery, where he and the greater part of

MANGAS.

Victorio.

Lower California, sail through the gulf until the mouth of the Colorado was reached, up which shallow river boats plied and distributed passengers for the few river villages and inland points where a scanty population wrested a precarious existence. From the mouth of the Colorado River it was deemed necessary to send through a courier with dispatches to Fort Yuma, distant ninety miles, I believe, by the trail. Three long days we were steaming up the swift, shallow, and tortuous river, and when we did finally reach Yuma we found that our courier, a little, active, young Yuma Apache, had slipped across the trail in thirteen hours, or at the rate of about seven miles an hour the whole distance. Dressed in the uniform that their Creator issued to them, with perchance a dangling necklace or armlet of beads to ornament it, and a homeopathic breech-clout, these sinewy deer hounds of the desert, with fists clinched across their breasts, with a mouth full of messages, will keep up a "dog trot," hour in and hour out, for a time only limited by that which is necessary to reach their objective point, how

his band were swept from the face of the earth. Victorio dying fearlessly at the front as became a chief.

My first visit to Apache Land was in 1871. Then the favorite route to Arizona was to round Cape St. Lucas of

ever far it may be away,—and this too across valleys carpeted with cactus, and hills and mountains beset with flinty boulders. Some of their running feats of endurance are marvelous to relate, and are oftentimes made in a withering heat that makes life in the open field burdensome almost beyond bearing to the white man.

These Yuma Apaches are the most westerly of the family, living along the Colorado River in its lower part in Arizona, while on the upper part it found the Mojave branch, two sub-tribes almost identical in many characteristics. They alone of all the great Apache tribes cremate their dead, a cremation so effected that it does not cease with the body, but includes all the personal effects, however valuable, even in their *washans* (the universal Arizona expression for their trade houses).

These *washans* (as I notice the spelling in an Arizona journal) are made of a circular row of long lute brush, bent down toward the center and interwoven into a rough semi-globular shape, not unlike the half of an egg-shell on its rim. Over this is thrown either brush and a light sprinkling of dirt as a protection from the sun's rays. When these materials are scarce, mud is used as a substitute, the wealthier class being sometimes supplied with a piece of canvas. Their more permanent abodes are now and then made by digging into a steep dirt bank at an expenditure of muscular energy that one would hardly think possible among any band of Indians showing such equaler and lazziness in every other department of life.

The dialectic difference in the Yuma and Mojave Apache pronunciation of their common language is not noticeably great, but these again, on the contrary, differ from all the other Apache tribes to an extent apparent to persons who make no profession in linguistics. There are the harshest and about the most in guttural inflections of all the shades of this desert tribe, some of which are toned down to a softness quite pleasant to the ear, although these extremes readily comprehend each other.

Once the Yuma and Mojave bands held high rank as warriors among the Apache tribe, but their country lying easy of access, they were the first to succumb to civilization, and have gone a long way on that road of extinction which is marked out to those peculiarly tempered savages who can absorb only

APACHE RUNNERS.

the vices and but few of the virtues of such a contact.

To combat their ailments they have only the usual superstitious rites of a few ignorant "medicine-men," and occasionally make use of those heroic and barbarous treatments so common with savages. One of these I think may be interesting. A great hole, large enough to receive the body of the invalid in a recumbent position, is dug in the ground. In this excavation a fire is maintained until the ground is heated to its greatest possible extent, when the embers and ashes are scraped out. Several layers of damp mud are imme-

adorned, and, as far as I casually noticed, there being no difference between the men and women. Paints and pigments of all characters are eagerly sought for temporary personal ornamentation, the Yumas and Mojaves even descending to stove-polish, boot-blackening, and mud. Undoubtedly the latter, in some of its applications, serves a more practical purpose than mere ornamentation. A thin coating of soft clay is matted through the hair and then plastered carefully down upon the skull, until it resembles, when dry, a shining bald head or an inverted earthen bowl. This is left on for two or three days, until it has subserved

MEDICINE-MEN.

diately used to plaster the walls of this fiery furnace, and the invalid is then placed within and covered up with mud, the head alone protruding. The escaping steam makes the torture endured by the poor wretch, for the thirty-six to forty-eight hours of misery in the prison of baked clay, oftentimes insupportable, and but few survive the severe ordeal. A Mojave squaw, with the Americanized name of "Polly," rallied from this terrible inquisition, but it took the kindest treatment for two months under the care of a white physician to save her life.

Nearly all the Apaches are addicted to tattooing, their faces and wrists being usually

its purposes of deadly destruction, when the earthy skull-cap is broken with a stick and the beating process continued until every particle of dust is thoroughly eradicated, when the hair is washed with the soft pulp of the root of the Yucca palm, which produces a soapy lather. After this the hair is energetically rinsed and then whipped in the open air until dry. From all this manipulation it emerges as glossy and as soft as silk.

This Yucca palm is commonly known as the Spanish bayonet and oftentimes as the soap-weed, the latter name being evidently derived from this peculiar use by the Indians and Mexicans. It is one of the most exten-

sively common plants of Apache land and contiguous countries, and it is well for those localities that a commercial use has been found for this abundant weed, its pulp, according to recent experiments, bidding fair to give a very

named and the Tontos, a clan of central Arizona. Among the Apaches, men are never accused of this crime, but, at extremely long and rare intervals, some luckless squaw in a village that has seen more than its share of

APACHE MAN AND WOMAN.

fine grade of printing-paper. Thus the vulgar soap-weed that cleanses the outside of the Apache's head may yet improve its interior through the medium of the press.

The most barbaric forms of witchcraft have within fairly recent periods been practiced by them, especially by the two bands we have

misfortune is accused of these calamities as a witch. Either man, woman, or child can bear witness against the unfortunate, although the highest chief in the vicinity seems to be the proper one to prosecute her. The accusation once lodged, and, of course, as such complaints always are, believed without thought or trial,

APACHE SQUAW AND CHILD.

the entire village is summoned to the proceedings, which generally mean an execution. In carrying these on the victim is stripped to her waist and then tied up by her thumbs with strong thongs, her toes barely touching the ground. All of their devilish energies are now bent on extorting a confession from the wretch. Any of those who have had any misfortune, however remote, imaginary, or real, are at perfect liberty to flay the supposed witch with mezquite or willow switches until she faints from exhaustion, or terror and weakness forces a false confession in the vain hope of obtaining relief from her terrible condition. If she will not thus please them, the whipping is kept up until the executioners themselves are exhausted, when one by one they leave her to die, which results unless she be lucky enough to liberate herself from the thongs after the last one has departed. Should they wring a confession from her, she is beaten to death with stones and sticks, and all of her property burned, even to her rude house and ruder utensils.

On ordinary deaths, these Apaches mourn for a few days in wild plaintive cries that the uninitiated might mistake, at a distance, for the cooing of the turtle-dove. The nearest relatives cut off their hair as close as possible, and their mourning is kept up until the hair grows out. All these latter rites are denied the poor wretch executed for witchcraft, but she is still entitled to a burial at the hands of her relatives if they make no display to insult the superstitious dignity of the tribe.

There are but few other superstitions that

have such disastrous results in their applications. It would almost seem that they had some supernatural dread of water, and this in a country where that fluid is conspicuously scarce. Fish never enters into their diet, although they are not hard to procure, and they repel them in a way that can only be based on superstition. Canoes are never used, although an occasional raft is made to transport effects in one direction, and, in general, a river is of no more use to them than furnishing drinking water or establishing a flat valley in which they can travel more readily on foot or horseback. In this way all traveling is done, and all household effects are transported either on the backs of horses or of squaws, the women generally predominating. Some of the muscular feats of the latter, while thus engaged, even rival the endurance and strength of the stronger (?) sex, as shown in their runners. A Yuma squaw has been known to carry over three hundred pounds of bulky hay between four and five miles over a mountain road and without stopping on the way. Not much was left to the imagination of the story-teller either, as the hay was weighed on tested scales and the route pursued was a well-known measured one. More marvelous cases are heard of occasionally, but they are not so authentic.

Birds are also rejected as food, although they are used in cases of distressing scarcity; especially the wild turkey, which stands better in their estimation. Other native articles of diet, on which they yet subsist to a certain extent, are baked *mezcal*, the bean of the mezquite tree, the fruit of the giant cactus, and the prickly pear. To furnish them with meat they find extensive variety in the black and white tailed deer, antelope, bear, ground-rats, rattlesnakes, and rabbits (hares). Nothing exists to show that the Apaches were ever cannibals. No part of a slain animal is unused, even the smallest bones being broken open in order to save the marrow.

No drink-loving old toppers ever enjoyed their liquor so much as have the Apaches whenever they could procure it, a vice, however, that is rapidly subsiding as the tribes are concentrated at agencies more directly under the eyes of watchful authorities. *Mezcal*, made from that plant by the Mexicans, found its way in days gone by, when population was scattering and the laws lax, into Apache maws with every trade and deal-

HEAD WAR-CHIEF OF CHIRICAHUA.

ing between the two races. From corn they make a fermented drink called *tiz-zuin*, which is not as strong as the corn-whisky of civilization, but their peculiar method of drinking it compensates for its lack of strength. For some three days before it has reached its highest point of fermentation not a single piece of food is swallowed. At the end of that period they fill themselves to their utmost capacity with the undiluted *tiz-zuin*. Although half starved, it takes but a few moments to make them feel as if they had had a major-general's rations for six months previous, while the most conspicuous effect is to swell their bump of combat-

NAT T-ZUOK-EE-EN

iveness to an inordinate degree. If a large number have indulged in this liquor, serious outbreaks and disturbances are almost sure to ensue, especially if other bands of Indians or any whites are near enough for them to reach before this temporary, stimulated combativeness has worn away. In fact, after having, when sober, decided to go upon the war-path, by far the most important preliminary is the manufacture of huge quantities of *tiz-zuin*. Its peculiar composition, and the no less peculiar manner of taking the liquor, gives it a most lasting effect upon the system, and an Indian with his stomach distended with it is said to have ahead of him a six to eight days' "spree," and during all this time his warlike qualities are sure to be most conspicuous.

There is much evidence to show that alcoholic liquor made from corn is an ancient drink with these people, everything that was necessary to manufacture it being found in their old ruins, and under circumstances that make such a conjecture not unreasonable. Even in the caves of the old cliff-dwellers of Arizona there have been found cemented deposits of corn

so ancient that when disturbed the grains fell from the coils a mass of impalpable powder, leaving the coils, singularly enough, as fresh as if it had been gathered but the harvest before.

To ramble for a moment from the main subject, in considering the ancient cliff dwellers of Apache land,—I was not a little surprised to hear of many cliff-villages yet unexplored. An idea prevails that the chimneys and caves of Apache land have been nearly all included in the residences of archæologists and curiosity hunters. An old Apache of San Carlos agency, whose perfect combative had been won by a government official, spoke of many that he knew had never been inspected and that were full of relics. He wished to conduct his confidant to a place not far distant. He added that only a small part of the remains known to the Apaches had ever been examined.

San Carlos agency, on the river of the same name, is the great central point where the Government has gathered from time to time the greater portion of almost all the Arizona bands of Apaches, who are slowly acquiring the arts of peace and will soon be a useful part of the agricultural population of that region. Here from the eastern boundary are bands of the Yumas and Mojaves, of the Tontos and San Carlos Apaches from the central districts, and of the Sierrita Blanca tribe from the north-eastern corner. The only important Arizona band not directly represented are the warlike Chiricahuas, and they are quartered on the reservation of which this agency is the headquarters,—except the leaders, recently surrendered, who have been exiled to Florida.

Their partly civilized, partly barbaric agency-life is not uninteresting in some of its aspects, especially while the barbaric element yet predominates. The Government has cultivated their martial feelings, and at the same time turned them to its own account, by enlisting the most trusty warriors as soldiers in its own service, and using them as a police and detective force against one another, and especially one tribe against another. No less than three full military companies of these scouts were, until recently, distributed among the Indians of this great agency;

THE CHIRICAHUA

THE CHIRICAHUA

and as the white soldiers were at the same time placed at distant points on the boundaries of the reservation, the Indians were thereby lifted a little in their ideas of sovereignty and self-government.

In every cluster of *wickeups*, and in fact in almost every family, might be found one of these scouts, acting in the interest of the Gov-

had gone through all the processes of his trial, there hung over his head a three-years' sentence in the penitentiary at Alcatraz within the Golden Gate. Even death has been meted out to offenders by Indian juries. A guard-house inclosed less refractory criminals, and through one of its windows peered the face of an Indian sentenced for life.

APACHE FULL DRESS.

ernment, and forming, in effect, a secret detective system more efficacious than the detective bureaus of civilization. While every crime was reported to the white chief-of-scouts, care was taken that the informer should never be known. But not long ago Ki-at-ti-na, the head war-chief of the Chiricahuas, tired of the monotonous restraint of the military, gathered around him a few of his belligerent band, still footsore from the war-path. They indulged in a preliminary war-dance, and, sending couriers to all likely to join them in an outbreak, impatiently awaited results. The chief's fleetest courier was a spy, who gave timely warning of all the concerted movements and intentions before an advance was really made. The chief's first intelligence of the result of his plot was his arrest by the scouts of his own tribe and his arraignment before the authorities at the agency.

An Indian accused of any crime is tried before a jury of Indians, and when Ki-at-ti-na

These Indian soldiers, in all that pertained to arms, ammunition, pay, and rations, were on exactly the same footing as other soldiers in the service, except that their term of enlistment might be variable. A calling of the muster-rolls sounds like that of Hungarian Hussars or Polish Lancers, a deception of the ear that an inspection of the written names would not confirm. Their savage passion for finery and display cropped to the surface in an inordinate desire for military parade and exhibition, even to the extreme of monotonous drill, but much has been denied them in those particulars, as on their primitive *status* rests much of their efficacy as scouts against other bands.

In one of the last and then one of the most important and decisive campaigns waged against the most warlike band of the Apaches, the Chiricahuas of south-eastern Arizona, all of the friendly Apache scouts were employed and but one company of white troops, and in the con-

test which ensued in the broken mountainous defiles of the Sierra Madre of Mexico none of the white troops were used. Their endurance and rapidity of action are superior to that of white men, for they literally crawl in the grass like snakes, and creep and dodge through the rock-like squirrels in the branches of trees in their densest foliage.

Portraits of some of their most famous scouts are given. Nat-zuck-ei-ch, a Chiricahua squaw, was one of the most important against her own tribe in the campaign into Mexico just alluded to. Even before the main command had started she departed alone and on foot to determine the whereabouts of the hostiles in the fastnesses of the Sierra Madre mountains. On this trip she was absent for about six weeks, unceasingly prosecuting her object. A Chiricahua herself, it was evidently her intention to gain the Indian camp, claim that she had been captured by and escaped from the whites, and out all that she could, and then at the first favorable opportunity prove traitor to her tribe. Treachery is a distinguishing feature of the American Indian, but it is almost wholly a trait turned to account against the enemies of the tribe. Even the lowest Digger Indian has some faint conception of honor in his tribal relations in war, and among some it compares well with, if not exceeding, that among civilized nations, but the Apache seems to have absolutely none.

The painstaking labor to which they will go to emphasize their cruel treachery seems almost fiendish in the extreme. "Way back in the 50's" an emigrant family, winding its toilsome way through the burning desert of the Gila valley, on the road to California, found themselves, with an exhausted team, at the bottom of a steep hill, up which they vainly essayed to ascend. A band of Tontos Apaches, bent on some fiendish foray, passing that way, came upon the scene and at once willingly offered their services to carry their effects to the top of the hill. Not only did they do this, but the empty wagon was spared to the exhausted horses and hauled up by hand. This wonderful act of kindness was terminated by the massacre of the owners on the crest of the mesa, while all unawares they were reloading their wagon, the only object of their pretended

friendship being undoubtedly to secure this condition of apparent safety. I visited this spot over a decade later, and some four or five whitewashed head-boards, encircled by a neat fence of native mesquite brush, handily placed there by some frontiersmen, were not only monuments to the dead, but in actual a piece of treachery as was ever performed by any of the most savage tribes.

It will be seen that Nat-zuck-ei-ch's name

WARRIORS IN WAR DRESS.

has been somewhat abbreviated, an old mode of punishment among them for the highest order of marital infelicity that has been stopped by the authorities along with other cruel punishments. In virtue and modesty the eastern Apaches compare favorably with the best of Indians, but unfortunately the same cannot be said of the western tribes.

The most important scout in the campaign noted above was one T-zoe, whose translated

CHATO.

which, from their low mutterings and half-concealed threats, he believed to be in danger, knowing right well the Indian character, that they waste no time in hearing the arguments of the one fully accused. Going to the nearest agency, the San Carlos, was a jump "from the frying-pan into the fire," as he was immediately imprisoned, tried, and sentenced to death. The general revolt of his tribe, however, made him more useful to the Government as a guide than as a corpse, and he was spared the latter alternative by accepting the former, and right well did he do his work. It seemed singularly dramatic that this forced outcast of the tribe, compelled to flee for his life to a place where life was not even sure, should in so short a time be leading back into their mountain stronghold an army of his kith and kin that stretched a third of their warriors over the pinnacled field.

While General Crook was in the Sierra Madre mountains on this campaign after the Chiricahuas, many never before imagined sites of ancient races were discovered, and in such vast extent as to be almost bewildering in magnitude. There seemed to be a series of colossal steps or terraces made by man, the lowest of which, near the streams, was evidently inhabited by these crude and ancient people. On the tops of these hills or mountains, around whose sides the steps or terraces appeared, and apparently independent of them, were immense and extremely effective fortifications for the rude weapons they then must have had, a sort of rallying point of defense for the people living near the streams. Why these terraces, between the stream where they dwelt and overlooking fortifications where

they probably fled in danger, should have been constructed it seems hard to conjecture, unless it is possible that they lived near a constantly hostile and active enemy of which they had the greatest fear, and these, although for protection, were their garden-plats or limited

KI-AT-TI-NA.

grazing-grounds for their goats. An incline would have been as good, and would have cost no such immense outlay of labor in building the retaining walls. In many places through these rude structures had protruded the large pines of the country, some of which were two to three feet, or even more, in diameter. Everywhere, often in no small quantities, could be found their pottery, huge stone mortars for grinding corn (called *me-tates* in the vernacular of the country), and stone implements of war, and axes and hatchets. Under the overhanging cliffs were found caves that had once been inhabited, one series of apartments having no less than twenty-two rooms. Over one of these rooms was a large granary, capable of holding many bushels of grain. Here were corn-cobs, showing great age, mixed with pottery and stone axes. On the walls of

GERONIMO.

these rooms were hieroglyphics and pictured representations, none of which were copied or secured. It seems not unreasonable to argue from their cheerless homes and mighty fortifications that this was an inferior race of people in the age in which they lived. Even the Apaches who have made these labyrinths of lava their hiding-places superstitiously avoid these old ruins, and perchance this very fact may have saved to science valuable archaeological matter when the time comes for the investigation of these strange ancients.

Superstitions are shown in their dress and ornaments, or rather in the charms which adorn and compose these. The medicine jacket and belt are common to the whole Apache family, and are about the counterpart of similar dresses so common with savages. From the head of the

Chiricahua hangs a single buckskin string about two inches wide and as many feet in length, its upper end braided in the hair. This is ornamented with all the different pieces of shells they can obtain, and for which they seem to have a reverence, while beads and ornaments of silver and other metals help to cover it with an almost solid coating of decorations.

Maidens may be distinguished from matrons by the peculiar arrangement of their hair, the former wearing what in their language is called a *nah-leen* (*nah-leen* strictly interpreted is maiden). It is flat and of a beaver-tail dumb-bell shape, covered with red, and closely studded with gilt buttons, if procurable, the hair being tied up with this to prevent its flowing over the shoulders as with married squaws. In general, it may be said that the eastern tribes, Sierras Blancas and Chiricahuas, are far finer in dress than those of the western parts, the Yumas and Mojaves, the intermediate tribes of San Carlos and Tontos being also intermediate in dress. Still farther to the east in New Mexico are the Mezealero and Coyutero Apaches, also very ornamental in dress, but in other respects beyond the ken of this article in their now quiet isolation.

The war-dress of these warm-weather warriors, when actually in a campaign, is not so resplendent in buckskin and beads, nor is it so warm. A gorgeous bonnet of three hawk feathers is about the only display, and the rest has a sort of simplicity known only in the Garden of Eden. An old weapon with them was a heavy round stone at the end of a short stick, the two being wrapped and joined in a common case of rawhide taken from the tail of a horse or ox so as to be continuous and seamless. This was used like a policeman's club, and has its counterpart in the Sioux "skull-smasher," a word which describes it at once. The wild Chiricahuas used the lance, and do some good work with it in a decisive fight. Even the armed warriors use it in killing cattle and stolen stock to save their ammunition thereby, while some of the most horrible tortures practiced on their captives by these fiends are inflicted by this instrument. With the introduction of fire-arms into their warfare fell the shield into disuse. It was a gaudy appendage of the primitive savage, but it exists among the Apaches only as a relic for which they can obtain so much money from the curiosity seeker. They care but little for money, however, except to appease a craving for gambling, or to meet immediate wants.

They are behind no other savages in their love for the allurements of gambling, and use all sorts of implements, from the most intricate games of cards to the simple throwing of sticks and hoops, and in nearly all of these games

their play is one of hazard, in the excitement their horses, rifles, and even the shirts on their backs, changing ownership.

Only in their dances do they exert the physical energy put forth in their gambling plays.

APACHE WOMAN AND SHIELD.

From sunset till sunrise can be heard the beating of their drums and tom-toms, and night after night is it kept up. Old squaws and young children dance until they can stand no longer, and cease from exhaustion and fatigue; a cessation of but a few minutes and they are up and at it again. Their medicine dances take place in cases of sickness and distress, to drive away bad spirits or keep them from doing harm. In these the squaws are never allowed to take a part, but in peace, weddings, and feast dances, young and old of both sexes form a conspicuous part. The "corn dance," to make that plant productive, is also a monopoly of the medicine-men, while besides all these there exists the war, the conqueror's, and the chiefs' dances, varying in type through all the possible motions and gesticulations of the human body.

The ages which some of them reach appear surprising, considering their rough mode of life in the past, which seems sufficient to end it rapidly when the physical powers begin to fail. Got-ha, a Sierra Blanca, a once famous warrior of their tribe, is probably eighty or ninety years of age, and seems hale and hearty

NACHEZ, SON OF COCHISE.

yet. Could this old sage of the sandy deserts concentrate the salient points of his life into a volume, it would rival the tales of Daniel Boone or Kit Carson. Age, however, finds only a place in their councils of peace, and young blood rules in times of war, unless some mighty chief, with a record of battles that none can gainsay, bears all before him even in his age. It is a keen appreciation of the eternal fitness of things that has helped them in no small way to hold for so long the mastery of the South-west in peace and in war. One mighty chief of theirs was Cochise, a household word in the literature of Indian depredations. A Chiricahua himself, his success was sufficient to join many bands under his rule, and especially those *renegados* so common in all Indian warfares and so numerous in every band who will join every revolt without regard to tribe or cause, if the revolt only promise booty and that bloody excitement which their nature craves. For years he was the terror of all in Arizona, and for a long period before his own tribes could be turned against him the sum total of his battles placed him plainly ahead. For savage strategy and barbaric grand tactics

ZELE.

he will always be a mark in the annals of Indian warfare, and will be better known as this country settles up to that extent that it will demand a history of its own. Cochise bravely acknowledged he was out-generaled once. A military train of a score of wagons, guarded apparently by only a small platoon of cavalry, bore down through Apache Pass, where Cochise had some two or three hundred warriors in waiting, and their eyes glistened with delight as they looked at the chance of an easy capture of the hard bread, molasses, sugar, and tobacco on which they might revel for weeks. They made one wild yelling charge on the train from every quarter, when, instead of savage luxuries, there came from each wagon a blinding, crashing volley from nearly a score of well-armed infantrymen. Cochise's warriors were sent flying back like surf, and, as they fled up the steep sides of the cañon, were

picked off like squirrels in a tree. Cochise died some nine or ten years ago a natural death, a singular ending for one who had been so active in the trade of death. However much they may have hated him in that frontier land, even their legislature honored him with a conspicuous county, showing that their hatred could not conscientiously descend into contempt.

After Cochise came Victorio, whose fate has been noted. Then Nana led them for a brief period of time, and then came Nachez, son of Cochise, who rules the Chiricahua band. Juh (pronounced *Hoo*) was a noted leader, and met his death in a way that was scarcely heroic. Blindly drunk with *mezcal*, he attempted to ride from a Mexican town to his village, his head buried in his hands, and his elbows and the responsibility of getting home resting on the pony's shoulders. As they crossed a shallow stream, the horse, believing it was his turn, leaned forward for a drink, and Juh was precipitated into the water, and there, with his face in that kind of liquor that he had not followed closely enough in his life, he was drowned.

Loco is an important chief, he being at one time a medicine-man. In a career uniformly good—as savages judge careers—and nowhere brilliant, it is hard to speak further of him in a contracted article.

Geronimo, said to be a captured Mexican youth, might be styled the Daniel Webster of the Apache Senate. His advice was always sought on every particular matter of state, and his influence therein was equaled by few before his incarceration in a Florida prison, as the result of the latest and one of the greatest outbreaks under him, which ended with his surrender.

Chato, Bonito, Chihuahua, Mangas, and Zele form the lesser lights in this list of leaders.

Railroads run their double bands of iron through their deserts, mines pour their ores from the sheltering sides of their mountain homes, an inexorable decree has cramped them to a corner of their country, where they now wrest a living from the soil they once trod as masters, and it may be well said that the Apache sun is near the horizon of their national destiny.

WIFE OF NACHEZ.

WIFE OF ZELE.

FROM AN ANCIENT IRISH MOUND.

ON this lone mound of legend, heaped by hands

That have been still from immemorial years,
Above their mythic chief, whose vassal lands

Forget his name,—so long forgot by tears,—

I dream. Below me wrath and ruin are.

England's ally there shook down Philip's fleet.

Here sings a young bird like some morning star,
The old song's sorrow makes the new song sweet.

Sarah M. B. Platt.

A GLIMPSE OF WASHINGTON IRVING AT HOME.

It is now forty years and over since I was a school-boy at Tarrytown, and when I revisited the place not long ago I was not surprised to find it somewhat altered. The changes I remarked were, however,

only such as might have been looked for in a town so prettily situated and so near New York; and I was pleased to find that the memory of Washington Irving had restrained the hand of improvement from destroying the few objects to which his writings have given an interest, as well as from defacing the sites which tradition or popular imagination has identified with the scenes of his delightful legend. **Sleepy Hollow is still very much the same** lazy country road it was in the old days when we school-boys wandered along it in the summer afternoons picking blackberries from the wayside vines. Following the turnpike-road down the hill, we come to Beekman's mill pond; and crossing the pretty stream, the Pocantico, on the bridge over which Ichabod galloped, pursued in his mad flight by the headless horseman, we reach the old Dutch church, surrounded by the graves of many generations—those of the earlier settlers clustering thickly about the church itself, while the newer graves people the rising ground toward the north.

It is in this newer portion of the cemetery that Washington Irving lies. His grave is in the middle of a large plot purchased by him in 1853, six years before his death. The stone that marks his grave is a plain slab of white marble on which are engraved his name and date alone, without any memorial inscription. The path that leads to the entrance-gate of the plot is so worn by the feet of visitors that a stranger hardly needs to ask his way to the place.

I confess I heard not without a secret pleasure that the relic-hunters so chip and hammer the stone that marks Irving's grave as to make its frequent renewal necessary. It

did not seem to me a grievous wrong, not in any true sense a profanation of the grave, but rather a testimony to the loveliness of Irving's character, and an evidence of the wide extent of his fame, that, from filling the circle of the educated and refined among his countrymen, has now come to include that lower stratum of our common humanity which has only instinctive and, so to speak, mechanical ways of expressing its feelings. Who is so insensible to the good opinion of his kind as not to thank such a trodden path as this that leads to Irving's grave better than any written line of praise, and the very destruction of his monument, by this reprehensible clipping and chipping, a more enduring testimony to his work than any monument of brass!

It would not have been easy to find a place more in harmony with the associations that gather about Irving's name as a writer than the spot in which he is buried. Even to-day, with all the changes that have been brought about by the growth of the neighboring settlement, the spirit of peace and quiet that used to brood over the region hovers there undisturbed. Irving's own words, in the "Legend of Sleepy Hollow," describing the grave-yard, the old church, and the stream that plays about its feet, reflect with the faithfulness of a mirror the scene as we behold it to-day.

Here is the church, a small building with rough sides of the country stone, surmounted by a picturesque roof, and with an open bell-turret over which still veers the vane carved with the initials of the Vrederick Felypsen who built the church and endowed it in 1699. In our rambles about the grave-yard we used to find the bricks of light-colored clay, brought from Holland, and of which, so tradition said, the church had been originally built, or which had, at any rate, been largely used in its construction.

The church was seldom used, except in the summer-time. On communion Sundays the handsome seventeenth-century Jacobean table of oak brought from Holland, where plenty like it may still be found, was set out, as it is to-day, with the plain vessels of silver "pre-

sented by Queen Anne," as the formula goes, that used to please my childish taste for things that had about them the flavor of old days.

The same budding taste for antiquities led me and some of my school-mates to the old grave-yard, where we hunted up the oldest tombstones, scraping off the moss and lichens to decipher the names and dates, and enjoying many a laugh over their carved ornaments, scrolls, and cockle-shells, and sturdy, dew-lapped Dutch cherubs, with their stumpy little wings scored like checker-boards for plumage. Many of these gravestones were said to have been imported from Holland by the early settlers, like the bricks of which the church was built, the table in the church, and much of the furniture to be found in the farm-houses of the country-side, chairs and tables, cupboards, and even looking-glasses. The carvings, memorial verses, and scripture-texts upon these tombstones were cut by the more skillful workmen over-seas, and the names and dates were filled in here at home as occasion called.

Even so early as when Mr. Irving wrote the "Legend of Sleepy Hollow," he tells us that the bridge over which Ichabod Crane clattered half dead with fright, pursued by the headless horseman, had long disappeared, and that the present one had been substituted for it, to avert the omen of the tragedy. The banks of the Pocantico above the bridge are greatly changed since those primitive days. They are now cleared of the underbrush that once clothed them so thickly and through which a narrow cow-path made its devious way. The cow-path is now an orderly lane, and the sunlight strikes through tamer leafage on a well-kept turf; for the banks of the pretty stream have been transformed into a rural pleasure-ground, where the plump Katrinas and spruce Ichabods of to-day may wander and flirt at their will on Sunday afternoons.

Although Tarrytown retains certain of the features that it had when I first knew it, yet the general character of the place is very different. When those of us who used to read Washington Irving's tales and sketches among the scenes in which they are popularly supposed to have been written read them now, in the midst of this combed and curled landscape, set about with overdressed houses, and inhabited by people who regulate their lives by the city clock, we no longer feel the harmony between the printed page and the life about us that we felt then. It was easy, in the old time, to believe the story of Ichabod Crane, because the characters described in the tale were just such people as we met daily in the village street, or in the church on Sundays, and Irving has

hardly made use of the novelist's license in portraying them.

The brisk little woman who was cook in our boarding-school was Mrs. Van Tassel; and the delicious fragrance of her bread, baked twice a week for us in an old-fashioned brick oven, has power even at this late day to make us forget that she had a temper of her own, of which her red-headed scape-grace of a son stood as much in awe as we. The question with us was, what was her relation to Katrina? For, to the boyish mind, the facts that she was a Van Tassel, and a native of Tarrytown, were convincing proofs that she belonged to the family of the renowned Baltus, albeit Fortune had played the good lady one of her jade's tricks in reducing her to the position of cook to a parcel of unruly boys.

And where, to-day, could be found such a figure as the weather-beaten deacon in the Dutch church presented when, in his blue coat and brass buttons, and his hair done up in a pigtail, he stood up in front of the pulpit and took the first note of the psalm-tune with a tuning-fork; the parson giving out two lines of each verse at a time, and the congregation following the precentor's lead with nasal unanimity!

I came on the scene a little late to get the full benefit of the primitive time; but there was enough simplicity left to stamp the image of the place on my memory as a sleepy neighborhood, where dreaming was more in fashion than doing. The village itself was a dull Dutch market-town, consisting, in the main, of one long street that lumbered slowly up the hill from the riverside to the narrow plateau along which the Albany turnpike runs. There was no communication with the city of New York except by steamboat or by sloop, for the railroad which has since ruined the banks of the most beautiful river in the world was not so much as thought of at that time. In the winter we drove to the city in sleighs. I believe no regular stage-coach plied between New York and Tarrytown.

Considering how dead the village was, so far as active interests were concerned, we were fortunate as school-boys in having anything to quicken our minds in the history and associations of the region. We became strongly interested in the legendary gossip of the time of the Revolution, much of which centered about André; his capture on our side of the river, and his trial and execution at Tappan, directly opposite us, on the other side of the broad Tappan Zee. The tree under which André's captors were sitting, playing cards, when he came up, for so the story ran, still stood in the field by the roadside; although, between the relic-hunters and the lightning, it

had come, when I knew it, to present a rather forlorn appearance. Mr. Irving made good dramatic use of this tree in his "Legend of Sleepy Hollow," but it is likely enough he had not seen it when he wrote the story.

Our minds, thus kept awake by living in an atmosphere charged with legendary lore and with local history, were still further inspired by living so near to a man of genius who had already made the country-side classic ground by his residence there, and by the legends he had enshrined in the amber of his style.

We were not aware, at that time, how slight was Mr. Irving's acquaintance with the region when he wrote the legend that has made it immortal. When he published the story of Rip Van Winkle he had not visited the Catskill Mountains, and he went to Tarrytown for the first time in 1798, when he was fifteen years old, with his dog and gun, for a few days, and it would appear that he did not see the place again for several years — certainly not until some time after "The Sketch Book" had made him famous.

Mr. Irving first heard the story of the headless horseman from his brother-in-law, Mr. Van Wart, in Birmingham, at the time of his visit to England in 1819. The two homesick friends fell to talking about old times and scenes, and among the stories that Mr. Van Wart recalled was this one, which so tickled Irving's fancy that he sat down at once — such was his happy, off-hand way — and rapidly sketched the outline of his story, which he afterward finished in London and sent home to America, to be published, with other stories, as the sixth number of "The Sketch Book." He says himself that the story is a mere thread on which to string descriptions of scenery, and surely all that he wrote came from his heart. He had seen the Hudson for the first time in the full flush of eager boyhood, sailing up the river from New York to Albany, but without stopping anywhere, and the strong impression made upon his mind at that time by the beauty of the scenery, strengthened a little later by his visit to Tarrytown, was sufficient to root his imagination in that region. Years afterward, homesick and discouraged in London, the seed so early sown burst into sudden life; and in that one picture and its companion, Rip Van Winkle, all the landscape was painted breathing warm with life and feeling, but with little more care for detailed resemblance to any one spot than a Claude or a Turner shows.

Not far up the Sleepy Hollow road was the little country school-house which we had decided, on no better authority than that of childish imagination, must be the school-house

in which Ichabod Crane taught. One day I ventured to ask Mr. Irving if it was really the same, and I can still see the sunshine-smile in his handsome face as he put me by with some quizzical, non-committal answer. Had I been wise, I should have known enough to be content with the credentials furnished by imagination. But children have a very commonplace hunger for facts, and so in my ignorance I exchanged a pleasing certainty for an empty doubt.

While I was at school at Tarrytown, Mr. Irving was living on his little Saline farm of Wolpert's Roost, which afterward was so widely known as Sunnyside. The place, which originally contained ten acres, afterward increased first to fifteen and finally to eighteen acres, lay on the river-bank a few miles below the village, in a neighborhood vaguely known as "Deerman's." There was no distinct settlement at this point in my time, but in 1854, the place, having accreted enough population to warrant it, was set off from Tarrytown and incorporated as a village, to which, out of compliment to Mr. Irving, the name of Irvington was given.

Mr. Irving had never been a man of means, and at the time I speak of his early fame as a writer had almost died away. Had I been at school in any other place than Tarrytown, I suspect I should have heard very little about him. But our schoolmaster had named his school the Irving Institute, and had persuaded Mr. Irving, out of his abounding good nature and liking for young folks, to visit the school occasionally at "Commencement" time, and give out the prizes. This of course made it necessary to keep us acquainted with Irving's writings, and there were some of us who found this no ungrateful task. "The History of New York" and "The Sketch Book" we knew by heart. In the village, too, Irving was not without local honors. The new hotel was called the Irving Hotel, the myth-making spirit had already given a local habitation to all the incidents of the "Legend of Sleepy Hollow," and strangers were directed on Sunday to the church where Mr. Irving was a regular attendant, and where they could study the great man at their leisure.

All this, however, was the result of Mr. Irving's residence in the neighborhood. In New York, to say nothing of the country at large, comparatively little was said about Irving. He was reckoned a little old-fashioned, and people's eyes were turned rather to Longfellow and Hawthorne and Emerson, and to Lowell, the newest risen star.

Something of Irving's literary position in New York at that time was owing, no doubt, to the grudge that existed against him in the

minds of the descendants of the early Dutch settlers, on account of his "History of New York." I crossed the ocean not long ago with a member of a New York family whose name is known as honorably as it is widely, and whose members have done good service in many fields of culture. In the long summer days on deck we talked of many things, and naturally enough, both of us being New Yorkers, we came upon Irving. I was taken aback by the heat with which my companion attacked his name. He frankly expressed his dislike, and when I pressed for a reason, I found it to be that Irving had made New York ridiculous. The city had a more than respectable early history: it was one highly honorable, and Irving's book had turned it into irretrievable caricature. It would need a talent as great as his own—for the talent was frankly conceded—to paint the canvas over again; it was doubtful, now, if it would ever be done.

I could not sympathize in the least with my companion's view. As I looked at the matter, I thought New Yorkers ought to be much obliged to Irving for having built up so lively a structure on the flat marshland of their early history. And why should not New York have a fanciful early history as well as Rome or England? We read the stories of the Greek cities as if we believed them; why should we stick so at our own fabulist and his work—"the Dutch Herodotus, Diedrich Knickerbocker," as Mr. John Duer, one of the old Knickerbockers, had the magnanimity to call him? Is it not likely that the stories of Menelaus and Helen, of the wooden horse, and of sulking Achilles, were as disagreeable to old Greek and Trojan families as the fables of Van Twiller and Stuyvesant were to the old New Yorkers?

Irving has been called the last of the mythologists, but it must be admitted that Cable and Craddock are showing delightful skill in work of a similar kind. And the way in which a brilliant, charming, and sympathetic writer has been criticised in New Orleans enables us to understand how Irving was treated in New York. His nephew's "Life and Letters" has some amusing anecdotes relating to the subject. Irving himself treated the matter rather lightly, but even he must have had some feeling on the subject, for in his revised edition of the "History," he withdrew the original dedication to the New York Historical Society. A distinguished scholar, a member of one of the oldest and most respectable of the Dutch families, had said, in an address delivered before the Society, speaking of Irving and his "History": "It is painful to see a mind, as admirable for its exquisite perception of the beautiful as it is for its quick

sense of the ridiculous, wasting the riches of its fancy on an ungrateful theme, and its exuberant humor in a coarse caricature."

And to show how deep was the irritation caused by this "coarse caricature," which Walter Scott and all the cultivated world of England found so delightful, and which was the foundation of Irving's fame and fortune, I would record that, while writing this paper, finding myself in the country, away from my books, I asked a member of a family which may surely stand as representative of everything the Knickerbockers had of best, if in her father's library—very rich in English literature, and in beautiful editions, the envy of the bibliophile—I could not find "The Sketch Book."

"Well, no," was the half-amused, half-ashamed reply. "We have not, I believe, a single work of Irving's. You know when grandfather lived, and we were young, Irving was *taboo*!"

But in 1846, after his return from Spain, where he had most acceptably filled the position of Minister, Irving's sky, which, when all is said, had never been seriously obscured, cleared finally, and took on that mellow beauty which continued to the end of his life. Perhaps no incident will serve better to mark the date of the change in Irving's literary fortunes than the publication of Lowell's "Fable for Critics":

"Set forth in October, the 31st day,
In the year '48, G. P. Putnam, Broadway."

Lowell's enthusiastic greeting to Irving in this delightful burst of youthful spirits, one of the best characterizations in the poem, begins with an allusion to Irving's recent return from Spain. In the same year with the publication of the "Fable for Critics" began the re-issue of Irving's works by Mr. Putnam, most generous of publishers and kindest of men, whom not even a Napoleon would have found it in his heart to shoot, or if he had, no Charles Lamb would have toasted him for it. The success of this venture was very great. The eyes of the public were again turned upon Irving, and his early triumphs were renewed: no less than two hundred and fifty thousand volumes of the new issue of his works were sold during his lifetime.

Neither the public honors that were heaped upon him after his return, nor the prosperity that came so unexpectedly to reward his literary labors, had any charm to wean Mr. Irving from his taste for the simple pleasures of a country life, his plain house, his old friends, his little study lined with books, his rambles on horseback among the well-known hills and lanes, his vine-trellised piazza (we have no American

name for this distinctively American thing) where he could sit at his ease in the summer evenings and hear the waves of the Hudson River lapping the shore at his feet.

Everybody knows the exterior of the cottage at Sunnyside from pictures, engravings, photographs, or from having himself been one of the hundreds of pilgrims who have visited it. When Irving bought the place, in 1835, there stood upon it a small stone house called Wolfert's Roost (Roost, rest), from a former owner, Wolfert Acker (the name of Acker is still heard in the neighborhood), who had been one of the Committee of Public Safety, and who had come here to set up his Rest, and take his ease. Mr. Irving called in the services of an architect, Mr. George Harvey, to fit up the cottage for his occupancy, and he was fortunate in finding so sympathetic an assistant. When it was finished, it had not only lost nothing of the character which first struck Irving's fancy, but it had that air of "old times" about it which is so hard to give to a new place, or even to an old place made over. The architect gave it back comfortable, and suited to Mr. Irving's needs, yet no less picturesque than it was when he first described it — the "little old fashioned stone mansion, all made up of gable ends, and as full of angles and corners as an old cocked hat."

The principal external feature was a substantial porch, supporting a room overhead, and with a crow-step gable surmounted by a weather-cock. Over the entrance to the porch is a stone bearing the architect's name and title, "George Harvey, Bomr," an abbreviation for "Boumeister," which Mr. Irving had raked up as Dutch for "architect."

Every visitor, too, must have remarked the fine growth of English ivy which covers the eastern side of the cottage with a thick mantle of green — so thick, indeed, that the windows of the second story had the look of being cut out of the solid mass of shining verdure. This ivy has grown from a slip brought from Melrose Abbey and presented to Mr. Irving by his friend Mrs. Renwick. This lady, Mr. Pierre Irving tells us, was a Miss Jeffrey of Lochmaben, Dumfriesshire, Scotland. She was the heroine of Burns's "Blue-eyed Lassie," as well as of another of his songs, "When first I saw my Jennie's face."

After Mr. Irving's return from Spain, in 1846, the services of Mr. Harvey were again called in for an addition to the cottage which should make living in it more comfortable as a permanent dwelling, with better offices and more commodious servants' quarters, and this work was accomplished as successfully as the other. No material changes were made in the internal arrangement of the older part of the

building, but externally, as a whole, the alteration was very marked: the sky-line was much enlivened by the pagoda-like roof over one portion, which was the subject of some good-natured rally on the part of Irving's neighbors; and when it was completed the house had a picturesque charm uncommon enough at that time. With the turn in Mr. Irving's literary fortunes which began at this time everything relating to his personality became of interest to the public, and artists found the cottage at Sunnyside a popular subject for sketches and pictures.

The interior of Mr. Irving's house hardly corresponded with the promise made by the outside. As I remember, it was plainly but comfortably furnished; and, compared with almost any house lived in by a person of Irving's position to-day, would certainly be said to have a bare look. I was particularly struck with this in the parlor, where the only ornament I remember was the portrait of Irving painted in 1820 by Stuart Newton, and of which the head and bust, showing the fur collar of his coat, is engraved in his nephew's "Life and Letters."

If the parlor were somewhat bare, Mr. Irving's study was hardly more attractive. It was a small room, to the right on entering, with windows looking to the south and east; that facing the east was framed in the ivy of which I have spoken. In the middle of the room was the plain table, always in a state of healthy disorder, at which Irving wrote, and at the north end was an alcove filled with books. As a youngster fond of reading, and with my mind made up as to how the workman of a famous author ought to look, I was much disappointed at the somewhat uninviting appearance of this small chamber. But Irving's literary work had not been of a nature to make many books necessary, and the writings that have given him his true reputation — the "History of New York," and "The Sketch Book," with its followers in the same field — were all written and published before he came to Sunnyside to live. There was nothing in Irving's surroundings, or in his way of life, to suggest the literary man. His home might have been that of any gentleman bachelor with a happy turn for indolence, with no expensive tastes, but with an inherent relish for the simple pleasures of country life.

This absence of picturesque or artistic surroundings, supposing it to have been noticed at all, was quickly forgotten, however, by all who met him, in the charms of his manners, and in the pleasure of listening to his talk. Yet it was not at once seen wherein the charm of his manner lay. No one of the stock epithets describes him. He had at fifty-seven,

when I first saw him, the unconscious animal spirits of a boy. He could make himself at home with anybody, and put a child, or even a bore, at his ease. His fine face, to which no artist ever did justice, such was its mobility of expression, was now all sunshine over his own mirth or that of somebody else, now working with emotion as he recalled old times or spoke of some friend from whom death had separated him, or from whom he had just now parted with little hope to meet again. Easy and natural as were Mr. Irving's manners, there was a strong individuality behind them: they are reflected in his books, whose limpid style seems so easy to imitate, and yet is beyond the reach of effort.

I happened to be with him on one occasion when a young man whom he knew called upon him, and in the course of the conversation informed him that he had recently married. "Who is the lady?" said Mr. Irving; and on hearing the name—"What! a granddaughter of Mrs.——, the lady who declined to dance with Washington? Dear me! dear me! Since I have been writing the 'Life of Washington,' I have heard of no end of ladies who had danced with Washington, but Mrs. —— is the only one I ever heard of who had declined to dance with him!"

And in the newspapers lately there was a story which might certainly have been true, if it were not. Irving was walking one day in his orchard when a small boy who was prowling about accosted him, and with a confidential air offered to show him "the old man's best tree," if he would shake it for him! Irving agreed; and "By George, sir! if he didn't actually take me to the very best tree on my place!"

When I was last at Tarrytown, I was visiting at one of those handsome houses and

well-kept places which make the sleepy, slouchy ways of the region, such as it was in my school-boy days, seem more than ever like a dream. My hostess took me to the edge of the velvet lawn, and showed me a rock. "That," she said, "we call Irving's seat. This place, when we bought it, was a farm. It belonged to old Captain S——, and he told us that Mr. Irving used to climb this hill and sit on this rock overlooking the river and the landscape, and Captain S—— found it so pleasant to have him come, that he had the rock shaped into a rude seat to make it more comfortable. Here Irving would spread the plaid with which he was accustomed to protect his shoulders and which he used instead of an overcoat in walking about, and here he sat with his old farmer friend beside him, and passed the hour in homely chat or alone with his own thoughts."

The last time I saw Mr. Irving in his own house something turned the conversation to the group of American artists—Leslie, Stuart Newton, Allston, and the rest—with whom he was so intimate in London at the time of his first visit. I think what led to his speaking of his friends was my asking him some question about his portrait by Stuart Newton, which, as I have said, hung in the drawing-room. After a little, the talk turned on Allston, and he began to speak of him in the tenderest, most affectionate way. "I was just reading over one of his letters," he said; and he rose quickly from his chair and went into his study to fetch it. Returning at once with the letter in his hand, he began to read it, but had not gone far when his recollections overcame him, his eyes filled with tears, and exclaiming, "I can't bear it," he threw the letter down on the floor. Recovering himself, he changed the subject, and I presently withdrew.

Clarence Cook.

THE DESERTER.

BLINDEST and most frantic prayer,
Clutching at a senseless boon,
His that begs, in mad despair,
Death to come;—he comes so soon!

Like a reveler that strains
Lip and throat to drink it up—
The last ruby that remains,
One red droplet in the cup.

Like a child that, sullen, mute,
Sulking spurns, with chin on breast,
Of the Tree of Life a fruit,
His gift of whom he is the guest.

Outcast on the thither shore,
Open scorn to him shall give
Souls that heavier burdens bore:—
"See the wretch that dared not live!"

Anthony Morehead.

THE CHEMISTRY OF FOODS AND NUTRITION. I*

THE COMPOSITION OF OUR BODIES AND OUR FOOD.

"Half the struggle of life is a struggle for food."—EDWARD ATKINSON.

"I have come to the conclusion that more than half the disease which endangers the middle and upper part of life is due to avoidable errors in diet . . . and that more mischief in the form of actual disease, of impaired vigor, and of shortened life, accrues to civilized man . . . in England, and throughout general Europe from erroneous habits of eating than from the habitual use of alcoholic drink, considered as I know that evil to be."—SIR HENRY THOMPSON.

"If we will care for men's souls most effectively, we must care for their bodies also."—HOMER E. S. FOSTER.

WHAT proportion of the cost of living might be saved by better economy of food; how dietary errors compare in harmfulness with the use of alcohol; whether, as some urge, our next great reform is to be in our dietetics; and to

what extent the spread of the gospel and the perfection of its fruit are dependent upon the food supply, are questions which it is not my present purpose to discuss. I have quoted the foregoing statements, however, because they come with authority, and because, starting from the widely different standpoints of the economist, the physician, and the divine, the conclusions tally perfectly with those of some studies of my own.

Mr. Atkinson cites statistics to show that all but the very few who are especially well to do, in this country as in Europe, must expend half or more than half of their earnings for their food; calls attention to our wastefulness, and urges the need of better economy in the purchase and use of food materials. The error which Sir Henry Thompson most seriously deplores is over eating. "It is a failure to understand, first, the importance of preserving a near equality between the supply of nutriment to the body and the expenditure produced by the activity of the latter; and, secondly, ignorance of the method of attaining this object in practice, which gives rise to the various forms of disease calculated to embitter and shorten life." Bishop Foster, considering, on the one hand, the destitution that prevails, both at home, and especially in some of the countries where missionary effort is put forth so vigorously, and, on the other, the intimate dependence of man's intellectual and spiritual development upon his physical condition, urges that we may hope for the best culture of the Christian graces in the hearts of men

only in proportion as adequate nourishment of their bodies is provided for.

I have been led to the conclusion that, in this country, many people, not only the well-to-do, but those in moderate circumstances also, use a needless quantity of food; that part of this excess, however, is simply thrown away, so that the injury to health, great as it may be, is doubtless much less than it all were eaten; that one great fault with our dietaries is an excess of meats and of sweetmeats; that even among those who desire to economize there is great pecuniary loss from the selection of materials in which the actual nutrients are really, though not apparently, dearer than need be; that many whose means are limited make still more serious mistakes in their choice of food, so that they are often inadequately nourished when they might be well fed at less cost; and, what seems the most painful thing of all, that it is generally the very poor who practice the worst economy in the purchase as well as in the use of their food.

The subject concerns the laboring classes in still other ways. Statistics as well as common observation bear emphatic testimony to the better condition of the American as compared with the European workman in respect to his supply of the necessaries and comforts of life. Nowhere is this superiority more striking than in the quality and quantity of his food. And the difference in the dietaries of the two is especially marked in the larger amount of potential energy, of capability to yield muscular strength for work and to fulfill other uses in nutrition, which characterizes the food of the American. That the American workman, in many cases at least, turns out more work per day or per year than his European competitor is a familiar fact. That this superiority is due to more nutritious food as well as to greater intelligence is hardly to be questioned. But the better nourishment of the American wage worker, as we shall see,

* See "The Food Question in America and Europe" by Edward Atkinson in this magazine for December, 1886.

is largely due to our virgin soil. With the growth of population and the increasing closeness of home and international competition, his own diet cannot be kept up to its present nutritive standard, nor can that of his poorer neighbor and his foreign brother be brought up nearer to that standard, without better knowledge and application of the laws of food-economy.

Some time since, at the instance of the United States National Museum, and in behalf of its food collection, I was led to undertake a study of the chemistry of foods. This has included with other matter a series of analyses of some of our common food-materials. To give some of the more practical results of this work, especially as viewed in the light of late research upon the more general subject of nutrition, is the purpose of the present articles.*

A POUND of very lean beef and a quart of milk both contain about the same quantity of actually nutritious materials. But the pound of beef costs more than the quart of milk, and its nutrients are not only different in number and kind, but are, for ordinary use, more valuable than those of the milk. We have here an illustration of a principle, or rather of two principles, of fundamental importance in the economy of nutrition: our food-materials contain nutrients of different kinds and in different proportions, and the nutrients have different functions, different sorts of work to do in the support of our bodies. Add that it is essential for our health that our food shall supply the nutrients in the kinds and proportions our bodies require, and that it is likewise important for our purses that the nutrients be obtained at the minimum cost, and we have the fundamental tenets of our system of food-economy.

The greater part of our definite knowledge of these matters comes from chemical study of food-materials, and from experiments in which animals are supplied with food of various kinds and the effects noted. In these latter, the food, the *egesta*, solid and liquid, and, in many cases, the inhaled and exhaled air are measured, weighed, and analyzed. Hundreds, indeed thousands, of trials have been made with animals of many kinds, and a great number with human beings of both sexes and different ages. The best work has been done during the last two decades, nearly all of it in Europe, and the larger share in Germany. It involves the study of the profoundest problems of chemis-

try, physics, and physiology, the most elaborate apparatus, and the greatest care and patience of the workers. The labor of days and weeks is often required for a single experiment of a series, and the result of many series may often be condensed in a very few words. If one seeks famous names in this field he may find them in Liebig, Pettenkofer, and Voit in Germany; Payen and Claude Bernard in France; Moleschott in Italy; and Frankland, Playfair, Lawes, and Gilbert in England, and many others. If he questions the practical value of the results, let him see how they are being applied in the construction of dietaries for the common people in Germany, and what they indicate as to the errors of our food-economy at home. If he would see how results of recent research in one country may be ignored, because unknown, by the writers of a different language in another, let him examine some of our latest magazine articles and text-books, the names of the authors and publishers of which ought to be a guarantee for better things.

What we wish to consider now, however, is not the extent of the science, but some of its more important teachings in their applications to our daily life. Our task is to learn how our food builds up our bodies, repairs their wastes, yields heat and energy, and how we may select and use our food-materials to the best advantage of health and purse.

I begin our study together with a wholesome fear of the editor before my eyes, knowing well that back of the courteous hint to make these articles not too abstrusely scientific there was a repressed warning to avoid the tone and language of the college lecture-room as unsuited to the pages of a magazine. But I must crave a little latitude; the results of scientific research cannot be explained without some tedious technicalities and dry details.

HOW CHEMICAL ANALYSES ARE MADE.

If I cannot be interesting, I will be orthodox, and go back to the Catechism, whose second question is "Of what are you made?" and the answer, "The dust of the earth." The fact that underlies this answer, namely, the identity of the elements of our bodies with those of the material objects around us, is one of the many which chemistry explains. This fact, embodied in the solemn language of the primeval curse, "for dust thou art, and unto dust shalt thou return," impressed upon us

* I am indebted to Professor Baird, Secretary of the Smithsonian Institution and Director of the National Museum, for permission to reproduce here several charts prepared to illustrate the food collection; nor can I forbear adding that it was through the generosity

of Messrs. Thurber, Whyland and Co., of New York, in defraying a considerable portion of the pecuniary expense of the analyses hereafter referred to that the latter were made possible.

A CORNER IN A CHEMICAL LABORATORY.

with our earliest religious teachings, clothed in fantastic imagery by poets, and understood so vaguely in the science, and dwelt upon so mysteriously in the philosophy of the past, is divested of much of its mystery by the matter-of-fact investigation of the present. The chemistry of to-day tells us of what elements and compounds our bodies consist. It gives us at least a glimpse of the ways in which they are framed together by the wonderful processes of life, and how they go through the round of growth and fruition, and are by decay resolved again into the forms from which they came. And the research of the past few years has shown us that even this decay is a vital process carried out by living creatures, whose mission is to take off the effete matter and fit it for use again.

A friend of mine tells of an editor of a prominent journal—and a Boston editor at that—who was much surprised to learn that it is possible to tell by use of the balance, the combustion furnace, the filter, and other appliances of the chemical laboratory, just what elements and compounds and what proportions of each make up the air or a mineral, or how much nitrogen there is in muscle or protein in wheat flour. But to the chemist these are the most commonplace, though not always the simplest, things. Indeed, our everyday handling of food materials often involves processes, though crude ones, of analysis.

We let milk stand; the globules of fat rise in cream, still mingled, however, with water, protein, carbohydrates, and mineral salts. To separate the other ingredients from the fat, the cream is churned. The more perfect this separation, *i. e.*, the more accurate the analysis, the more wholesome will be the butter. Put a little rennet into the skimmed milk, and the casein, called in chemical language an albuminoid or protein compound, will be curdled and may be freed from the bulk of the water, sugar, and other ingredients by the cheese-press. To separate milk-sugar, a carbohydrate, from the whey is a simple matter. One may see it done by Swiss shepherds in their rude Alpine huts. But farmers find it more profitable to

put it in the pig-pen, the occupants of which are endowed with the happy faculty of transforming sugar, starch, and other carbohydrates of their food into the fat of pork.

The New England boy who on cold winter mornings goes to the barn to feed the cattle, and solaces himself by taking grain from the wheat bin and chewing it into what he calls "wheat-gum," makes, unknowingly, a rough sort of analysis of the wheat. With the crushing of the grain and the action of saliva in his mouth, the starch, sugar, and other carbohydrates are separated. Some of the fat, *i. e.*, oil, is also removed, and finds its way with the carbohydrates into the stomach. The tenacious gluten, which contains the albuminoids or protein and constitutes what he calls the gum, is left. When, in the natural order of events, the cows are cared for and the gum is swallowed, its albuminoids enter upon a round of transformation in the boy's body, in the course of which they are changed to other forms of protein, such as albumen of blood or myosin of muscle; or are converted into fat, or are consumed with the oil and sugar and starch to yield heat to keep his body warm and give him muscular strength for his work or play.

I am using such technical terms as protein and carbohydrates and speaking of chemical processes with which daily usage makes no chemist familiar and which the reader will find referred to so often in these articles that I wish him to become familiar with them also. Indeed, these things are so much a part of ourselves, so intimately connected with our every breath and motion and feeling, with our life and health and strength, that labor spent in learning about them cannot be lost. It will help toward understanding the facts if we note how some of them are found out. To this end I will introduce the reader into a laboratory, being aided in so doing by the illustrations of the chemical laboratory of Wesleyan Univer-

MAKING WHEY.

sity. They show the rooms in which some of the studies whose results are to be described beyond were made, and part of the apparatus actually employed.

At one of the desks a student may be seen preparing oxygen. In a little flask he places some chlorate of potash—the material which we use as a medicine for sore throat. This he heats by the flame of a peculiar lamp underneath the flask. The oxygen is given off as gas and passes through a glass tube which is bent downward so as to open under the mouth of a glass jar, which latter has been filled with water and inverted over water in a basin. The oxygen bubbles up into the jar, while the water at the same time runs out, and thus the jar is filled with the gas. It looks like ordinary air, but when the experimenter sets fire to a stick of wood, blows out the flame, thrusts the glowing end in the oxygen, it bursts instantly into a brilliant flame. A piece of phosphorus, kindled and placed in the oxygen, burns with a flame of blinding brightness. And a steel wire burns in this gas even more brilliantly than wood burns in ordinary air. Thus the student learns as he could not from textbook or lectures, that oxygen, which makes up nearly two-thirds of the weight of our bodies, and one-fifth of the weight of air, is the great supporter of combustion.

But our special purpose here is to note how chemical analyses are made. Let us take as an example a grain of wheat. It contains water, which we may dry out by heating; organic matter, which may be burned by combining with the oxygen of the air; and mineral matters, which remain behind as ashes. The organic matter contains fatty or oily substances, starch and other carbohydrates, and protein compounds.

The object of the analysis is to separate these ingredients from one another and find what proportion of each is contained in the wheat. To make the analysis, we first grind the grain to flour. To find the proportion of water, we weigh off a small quantity very accurately in a chemical balance and put it in a little glass flask, the weight of which is known, and heat it for a number of hours, until the water is

driven out. When it is perfectly dry it is weighed again. The loss in weight represents the quantity of water in the flour. This heating is conducted in a drying oven which is kept hot by a gas flame inside the support on which the oven rests. In order to prevent the action of the oxygen of the air upon the flour while it is being dried, we keep a current of hydrogen gas continually passing through it. The apparatus for generating the hydrogen and forcing it through the flasks is shown in the

picture. In the large bottles above is sulphuric acid. This runs down the pipes into the tall narrow glass vessels on the floor. These latter contain zinc. When the acid comes in contact with the zinc, hydrogen gas is developed, and passes up by tubes through the top of the drying oven into the flasks. Such devices as these are necessary if we are to make large numbers of analyses with the greatest accuracy and speed. Like a steam-engine, they seem a little complicated, but the engineer understands his engine, and to the chemist his apparatus seems perfectly simple.

We have next to find out how much oily matter the wheat contains. For this purpose we must have some means of getting the oil out, and weighing it. The operation is by no means a difficult one. Suppose we have a mixture of sugar and sand and wish to find out how much sugar it contains. Sugar dissolves in water, sand does not. If we pour water into the cup containing the mixture, the sugar will dissolve, and if we pour off the water again the sugar will go with it and leave the sand behind. If instead of a cup we put the mixture in a little cloth sack, with meshes so fine that the sand will not pass through, and hold the sack over a dish and pour water into it, the water will dissolve the sugar and percolate through the cloth, carrying the sugar with it into the dish below. If then we boil off the water, the sugar will remain. We make use of an operation analogous to this in separating the fat from our wheat. The fatty and oily matters of the wheat dissolve in ether; the starch, gluten, and other ingredients do not. We therefore use ether in place of water for the solvent. Instead of the bag we place the flour in a little glass cylinder (I) having its lower end covered with filter paper. This small tube is put inside a larger one (O) whose lower end is drawn out into a neck like that of a funnel. This neck is then passed through the stopper of a little flask (F). If now we pour ether into the inner tube, it will dissolve the fat, percolate through the filter paper, and fall into the flask below. By passing successive portions of ether through the flour, we shall, after a time, dissolve out all the fat. But this would require a great deal of time and ether, both of which are expensive. Suppose we had some means by which

APPARATUS FOR
FAT EXTRACTION.

the ether, after bringing its freight of fat into the flask, could be driven out, leaving the fat behind, caused to return into the inner tube, dissolve another portion of fat and bring it into the flask, and be made to repeat the round again and again. Suppose, furthermore, this operation should be made to go on automatically, and that it could be carried on in several of these pieces of apparatus at once, while the analyst devoted himself to other work. Our analyses would thus be greatly facilitated. Precisely this is done in the apparatus at the left of the drying oven in the large picture, which shows the

chemist putting one of the pieces of apparatus together. To conduct the operation he partly immerses the flask in a cup containing water. Underneath is a lamp with a flame just hot enough to heat the water to a temperature somewhat below the boiling point. The ether, which boils at a temperature much lower than water, changes to vapor and passes upward between the inner and outer tubes into a long pipe which winds upward through the tank above like the worm of a still. The tank is kept filled with cold water; the ether vapor is condensed to liquid, falls back upon the flour in the inner tube, dissolves out another portion of fat, carries it into the flask below, and is then once more evaporated, leaving the fat in the flask; and so the same portion of ether keeps on its round, passing up in the form of vapor, coming back as liquid, and bringing fat with it into the flask. When the fat is all extracted the operator takes the apparatus apart, boils off the ether once more, and weighs the flask with the fat. Knowing how much the empty flask weighs, he has simply to subtract its weight from that of the flask with the fat in it; the difference is the weight of the fat.

The ways of finding the amount of nitrogen in food materials are of especial interest to us, because we use the nitrogen as a measure of the amount of protein, the most important of the nutritive ingredients. One of the most common of these ways, the "soda lime method," as it is called in the laboratory, is illustrated in pictures herewith. The flour is heated with a mixture of soda and lime in a combustion-tube. The small diagram shows the tube ready for the heating or "combustion," as it is termed. Connected with the long combustion-tube which holds the flour and

soda-lime is a bulb-tube containing a little acid. When the combustion-tube is heated in the furnace, as shown in the larger picture, the nitrogen of the flour is changed to ammonia, which is caught in the acid in the bulb-tube. When this is done we have only to find the amount of ammonia and calculate from it the amount of nitrogen. The picture of a chemist sitting by the window shows this latter operation. He has poured the contents of the bulb-tube into a dish called a beaker, added a few drops of litmus, which colors the liquid red, and is carefully drawing another liquid containing ammonia from an upright tube, called a burette, into the beaker. When just enough to neutralize the acid has been drawn into the beaker the color suddenly changes from red to purple. The burette is marked so that he knows just how much of the ammonia is required to neutralize the acid not neutralized by the ammonia from the wheat, and thus the quantity of the latter, and with it the quantity of nitrogen in the wheat, are known.

By such operations as these we are enabled to make analyses of different food materials, of the tissues and fluids of the body, and of other substances as well.

THE CHEMICAL ELEMENTS AND COMPOUNDS OF THE BODY.

BEFORE entering upon our study of foods it will be well to consider with some detail the composition of the human body. For a brief statement of the elements nothing can serve us better than the accompanying reproduction of some of the case-labels of the food collection in the United States National Museum at Washington. The figures are as computed by Messrs. E. A. Welch and R. H. Pomeroy, students in this laboratory, who have been at more pains than any one else, so far as I am aware, to use data collated from all available sources. No one has ever made a complete chemical analysis of a human body, but anatomists have made numerous weighings of the different organs, and chemists have analyzed their constituents. From the figures thus obtained it is possible to make an approximate estimate of the composition of the body of an average man, as is here done.

The diagram on the opposite page will help to a clearer idea of the relative proportions of the elements in the body. In the latter the proportions are expressed in percentages, while in the National Museum labels the estimated weights are stated in pounds.

These thirteen elements are combined with one another in the body, forming a great variety of compounds. Chemists have discovered

DETERMINING THE AMOUNT OF AMMONIA WHICH CAME FROM THE NITROGEN OF THE WHEAT.

more than a hundred different compounds in the bodies of man and other animals. Instead of attempting to enumerate all of them here, it will be more to our purpose to consider some of the principal ones. In doing so we may take advantage of the fact that the compounds in the body and those in the food are very similar, and discuss them together.

An ox eats grass and meal and transforms the compounds they contain into meat. We eat meat and wheat and change them into the materials of our bodies. Some of the compounds in the food are destroyed, others are only slightly changed in these transformations.

Water, which consists of the two elements hydrogen and oxygen, is a most important constituent of all animal and vegetable tissues. It makes up about seven-eighths of the whole weight of milk and of the flesh of oysters, one-fourth that of potatoes and very lean meat (muscle), one-third of bread, a little over half of well-fattened beef or mutton, and one-eighth of the weight of flour and meal. The body of an average man would, by the above calculation, contain about sixty-one per cent. or three-fifths water.

Of the materials of our bodies and of our foods the larger part is combustible, as was the case with the grain of wheat; that is to say, it will be burned if put in the fire. A small residue will, however, remain as ashes. This incombustible portion includes the so-called mineral matters. These latter consist of the metals potassium, sodium, magnesium, calcium, and iron, combined with other elements, as oxygen,

CHART I.—CHEMICAL COMPOSITION OF THE HUMAN BODY.

ELEMENTS.

The chemical compounds of which our bodies are made up are shown by chemical analysis to consist, mainly, of thirteen elements.

Five of these elements are, when uncombined (*i. e.*, each by itself and not united to any other element), gases. They are named:

1. Oxygen, 2. Hydrogen, 3. Nitrogen, 4. Chlorine,
5. Fluorine

The other eight are solid substances. Of these, three are non-metals:

6. Carbon, 7. Phosphorus, 8. Sulphur

The remaining five are metals:

9. Iron, 10. Calcium, 11. Magnesium, 12. Potassium,
13. Sodium

Besides the above thirteen elements, minute quantities of a few others, as silicon, manganese, and copper, are found in the body.

CARBON—A SOLID.

The body of a man weighing 148 pounds would contain about 31 pounds of carbon.

The diamond is nearly pure carbon. Graphite (the so-called "black lead" of lead pencils), anthracite coal, coke, lampblack, and charcoal are impure forms of carbon.

Carbon exists in combination with other elements in the body, of which it makes about one-fifth the whole weight—and as food.

Carbon burns, *i. e.*, combines with oxygen. In this combination, heat and force are generated and carbonic acid gas formed. The carbon taken into the body in food combines with the oxygen of the inhaled air, yielding heat to keep the body warm and force, muscular strength, for work. The carbonic acid is given out by the lungs and skin. Carbon thus serves as fuel for the body and is the most important fuel element.

PHOSPHORUS—A SOLID.

About 1 pound and 6 ounces of phosphorus would be found in the body of a man weighing 148 pounds.

Phosphorus is a non metal, light, very inflammable, and so soft that it is easily cut with a knife. Since it burns so readily in air, it is here kept under water.

United with oxygen, phosphorus forms what is known as phosphoric acid. This, with lime, makes phosphate of lime. Most of the phosphorus of the body occurs in this form in the bones and teeth, though it is also found in the flesh and blood, and especially in the brain and nerves.

LABELS FROM CASE OF SPECIMENS, ILLUSTRATING COMPOSITION

DIAGRAM I.

ESTIMATED PROPORTIONS OF CHEMICAL ELEMENTS

phosphorus, sulphur, and chlorine. Thus, in bone we have phosphate of lime or calcium phosphate, which consists of calcium, phosphorus, and oxygen; in muscle, potassium phosphate and potassium chloride, the latter a compound of potassium and chlorine, and so on. The mineral matters make about thirty per cent. of the weight of bone, one per cent. of the flesh and blood of animals, and from one-half of one to two per cent. of our ordinary vegetable food materials. The mineral matters constitute about six per cent. of the whole weight of the body of an average man.

VOL. XXXIV.—10.

The composition of the bodies of different persons varies greatly with age, size, nature, etc. The amounts of the several elements in the body of an average healthy man, then, are roughly as follows, weighing 148 pounds, with 148 pounds without clothing, may be roughly estimated to be, in pounds and tenths of a pound, somewhat as follows:

WEIGHTS OF CHEMICAL ELEMENTS IN THE BODY OF A MAN WEIGHING 148 POUNDS.

Oxygen	65.0
Carbon	18.0
Hydrogen	10.0
Nitrogen	3.0
Calcium	2.0
Phosphorus	1.6
Potassium	1.4
Sulphur	1.2
Chlorine	1.0
Sodium	0.8
Magnesium	0.6
Iron	0.4
Fluorine	0.2
Total	148.0 pounds

HYDROGEN—A GAS.

The body of a man weighing 148 pounds is estimated to contain about 14½ pounds of hydrogen, which, if set free, would fill about 2000 cubic feet.

Hydrogen, when combined, is a gas. It is the lightest and most common of all the elements. It is found in water, in which it is combined with oxygen, and in many other compounds. It is also found in the body, where it is combined with oxygen to form water.

Hydrogen is also found in the body, where it is combined with oxygen to form water. It is also found in the body, where it is combined with oxygen to form water.

CALCIUM—A METAL.

The body of an average man weighing 148 pounds has been estimated to contain about 2 pounds of calcium.

Calcium is a metal, somewhat similar in appearance to light metal, or zinc. It is very difficult to obtain free from other elements. United with oxygen it forms lime. This, with phosphorus and sodium phosphate of lime, the base of the bones and teeth, in which nearly all the calcium of the body is found. With carbonic acid, it forms carbonate of lime, the chief ingredient of marble and limestone.

OF HUMAN BODY, IN FOOD COLLECTION OF NATIONAL MUSEUM

The combustible portion of the body and of the food that nourishes it consists of so-called organic compounds. Since these are the most important substances we shall have to do with in our study of foods and nutrition, we ought to have a tolerably clear understanding of the nature of at least the principal ones.

If from a piece of meat we remove the bone, gristle, and fat as completely as practicable, and subject the remaining "lean" (muscle) to chemical analysis, we shall find about one-fourth, or, to speak more accurately, from twenty-two to thirty per cent., of it to consist of organic compounds, the rest being water with a very little mineral matter. Even if all the visible fat is removed, part of this organic matter will consist of fat in microscopic particles. The fatter the animal from which the meat comes, the more of these minute particles of fat and the less water will there be in the muscle, a fact, by the way, which has the most interesting bearing upon the composition of our own bodies, as we shall see later

on. If, however, we assume that the fat and the mineral matter are both out of the way, some very remarkable compounds will remain. The bulk will consist of substances very similar to the albumen or "white" of eggs, and hence called albuminoid—albumen-like—compounds. They are sometimes called proteids, but the name albuminoids is perhaps preferable. Albuminoids in different forms make the basis of blood and muscle. Fresh blood contains blood-albumen and other albuminoids; coagulated blood contains fibrine. Muscle contains muscle-albumen, and other albuminoids called syntonin and myosin. The last is the chief constituent, except water, of muscle. Many persons are surprised to learn that myosin, instead of being the tenacious substance of which muscle is commonly supposed to consist, is in living muscle probably liquid or semi-liquid. How the contractile power of the muscle of an athlete can be exerted by liquid or semi-liquid matter is one of the unsolved problems of chemical physiology.

Albuminoids occur in great variety in plants as well as in animals, but they all consist of the four elements carbon, oxygen, hydrogen, and nitrogen, with perhaps a little sulphur or phosphorus.

Along with muscle, the meat contains what we call gristle, the substance that bothers us so much when we try to carve with a dull knife. This name, however, is applied to several substances, as tendon and cartilage, which, with skin and bone, etc., are called connective tissues. These tissues consist mainly of compounds like the collagen of tendon and the ossein of bone. They are very similar to gelatin (glue) and are changed to gelatin on heating with water. They are hence termed gelatinoids. The gelatinoids are thus the principal ingredients of connective tissue, as albuminoids are the principal ingredients of muscle and blood. The gelatinoids consist of the same elements as the albuminoids; these two classes differ from the other organic compounds in that they contain nitrogen, which most of the others do not.

In speaking of the ingredients of foods, it is customary to give to both albuminoids and gelatinoids the generic name of protein. Protein compounds are the most important of all the ingredients of foods.

There is still another class of nitrogenous substances in meat which, though so small in quantity as to be often left out of account, are nevertheless extremely interesting. These are known in the chemical laboratory as creatin, creatinin, carnin, etc., and are designated collectively as "extractives," because they are extracted from flesh by water, as in the case with beef tea and Liebig's Meat Extract.

Chemists find certain analogies between these extractives from flesh and thein and caffeine, the active principles of tea and coffee, which they likewise resemble in their stimulating effect. The African traveler Rohlfs tells how invigorating he found a little meat extract spread on a piece of dry bread. The familiar fact that dogs that are quiet and subdued with vegetable food grow fierce on meat is most probably explained as the effect of these same substances. Some people, oftenest those of a fine nervous organization, I presume, find in meat a stimulating effect approaching that of wine. The extractives are similar to alcohol in that they do not form tissue, flesh, or fat. They have, apparently, no effect as fuel. In brief, they are stimulants rather than nutrients.

The extractives give the taste to fresh meat. They impart their savory smell and taste to soups, give roast beef its appetizing odor, and steak its toothsome taste. Our craving for meat is largely due to our fondness for these extractives, as the tastelessness of meat from which they have been removed in making soups bears witness. Indeed, I mistrust that the excessive use of meat, from which the average gourmand—and many of us are veritable gourmands in this respect—suffers so much harm to health, is traceable to the redolence and relish of creatin and other extractives. Though the extractives are different from true protein compounds, they contain nitrogen, and we may follow a common usage and class them as protein.

The body of an average man will contain about eleven per cent. of albuminoids, a little over six of gelatinoids, and about one of extractives, making in all not far from eighteen per cent. of protein.

Among the most important organic compounds of the body and of foods are the fats, of which chemists recognize many different kinds. In the body of man and many other animals, the principal ones are stearin, palmitin, and olein. Stearin, which is obtained in large quantities from beef tallow, is much used for candles, because it does not melt readily. Olein, on the other hand, is an oil at ordinary temperature, and is a chief ingredient of olive oil. A large part of the fat of the human body consists of olein. The fats just named consist of the three elements carbon, oxygen, and hydrogen.

The brain, nerves, and spinal cord contain substances called protagon, lecithin, cerebrin, etc., which, though commonly classed as fats, contain nitrogen and phosphorus, and are therefore known as nitrogenized and phosphorized fats. They have an especial interest because they are believed to be somehow connected with mental activity.

The fats make up about sixteen per cent. of the weight of an average man.

The other compounds in the body are so small in amount that we might pass them by. One class, however, the carbohydrates, demand a moment's notice, because they make up a large part of our food. These include sugar, starch, dextrin, and like substances. The principal ones in the body are glycogen, or liver-sugar, and inosite, or muscle-sugar. They consist of carbon, oxygen, and hydrogen, the same elements as occur in the fats, though not in the same proportions. They constitute only a fraction of one per cent. of the weight of a healthy human body.

To recapitulate, the estimated weights of these compounds in the body of an average man weighing 148 pounds, or, with clothing, 156 pounds, may be stated as in the figures below. The percentage composition is set forth more graphically in Diagram II.

DIAGRAM II — ESTIMATED PROPORTION OF CHEMICAL COMPOUNDS IN THE HUMAN BODY.

Compounds in the Body of a Man weighing 148 Pounds.

Water	90.0 pounds
Protein	26.6 "
Fats	23.0 "
Carbohydrates	0.1 "
Mineral matters	8.3 "
Total	148.0 pounds.

Of course I do not mean that this is an exact statement of the amounts of the compounds in the body of any given man or of an ideal man. These figures, like those above cited for the elements, are simply an attempt to show in a general way in about what proportions the materials probably occur in the body of an ordinary man of average size and weight. The bodies of different people vary widely in composition. The flesh of lean persons has more water, and that of fat persons more fat, in proportion to the whole weight. A lean man may gain in weight without corresponding gain of muscle or other protein compounds. The store of fat in his body increases. Part of this fat accumulates in adipose tissue next to the skin and in other masses such as we see in meats. Part is disseminated in small particles through the muscles, bones, and other tissues.

In studying the tissues of animals we find a considerable proportion of these particles of

fat to be so small as to be visible only by aid of a powerful microscope. A piece of muscle in which no fat can be seen with the naked eye may yield a considerable quantity of fat when treated with ether in the apparatus for fat-extraction. The muscles, bones, and other tissues contain large proportions of water. As the fat accumulates in them, part of the water goes out to make way for it. When, on the other hand, fat is removed from the living tissues, more or less of the water is restored.*

Accordingly a gain of weight of the body may mean a gain, not only of a corresponding weight of fat, but of enough more fat to make up for the water that is lost. To "get stout" is really to grow fat faster than the scales tell us, and to grow lean is to grow watery.

Of course gain of weight of the body may be due to increase of other materials than fat, as in the case of growing animals. So, too, there may be increase of protein with loss of fat, as in the muscle of an athlete when in a course of training.

PROPORTIONS OF NUTRITIVE INGREDIENTS IN FOOD MATERIALS.

HAVING learned what our bodies consist of, we have next to study the composition of the food by which they are nourished. Viewed from the standpoint of their uses in the nutrition of man, our food materials may be regarded as consisting of edible material and refuse, and the edible material as made up of water and nutrients. The accompanying adaptation of charts prepared for the food collection of the National Museum summarize what is most necessary to say here about the constituents of food.

We have next to notice the amounts of these ingredients in different food materials. The details will perhaps be best explained by an example.

CONSTITUENTS OF SPECIMEN OF SIRLOIN OF BEEF

	<i>In flesh, edible portion</i>	<i>In waste as largely as feeding refuse</i>
	<i>Per cent</i>	<i>Per cent</i>
Refuse, bones, etc.	None	26
Water	60	45
Protein	20	14
Fat	17	14 1/2
Mineral matters	1	— 1/2
Total	100	100

As stated above, some fat sirloin of beef was found to consist of about one-fourth refuse

*This statement is based not only upon observations recorded in memoirs and text-books of physiological chemistry, but also upon a somewhat extended series

made in this laboratory but still awaiting publication. It rests upon the assumption that the changes in composition of the tissues of the human body are similar

CHART II.—INGREDIENTS OF FOOD MATERIALS.

NUTRIENTS AND NON-NUTRIENTS.

Our ordinary food materials, such as meat, fish, eggs, potatoes, and wheat, etc., consist of:

REFUSE—as the bones of meat and fish, shells of eggs, skin of potatoes, and bran of wheat.

EDIBLE PORTION—as the flesh of meat and fish, white and yolk of eggs, wheat flour.

The edible substance consists of:

WATER,

NUTRITIVE INGREDIENTS OR NUTRIENTS.

The principal kinds of nutrients are:

1. PROTEIN,
2. FATS,
3. CARBOHYDRATES,
4. MINERAL MATTERS.

The water, refuse, and salt of salted meat and fish are called non-nutrients, because they have little or no nutritive value. The water contained in foods and beverages has the same composition and properties as other water; it is, of course, indispensable for nourishment, but is not a nutrient in the sense in which it is here used. In comparing the values of different food materials for nourishment, we may leave the refuse and water out of account and consider only the nutrients.

bone, etc., and three-fourths edible flesh. The edible portion was analyzed and found to contain, approximately, sixty per cent. of water and forty per cent. of nutrients. Of the nutrients the protein constituted, in round numbers, twenty, the fats nineteen, and the mineral matters one per cent.

Such numerical statements, however, are not entirely satisfactory, especially when a number are to be studied at once. Diagram III. (pages 70 and 71), in which the proportions of the ingredients are indicated by shaded bands, will doubtless be more acceptable.

Until within the past dozen years very little attention has been given in this country to the chemistry of animal and vegetable products, and most of the work actually done has had reference to their agricultural values. With the exception of analyses of cereals and dairy products we have very few American

to those found to take place in the bodies of other animals. It is by no means urged that the quantities of water and fat which thus mutually replace each other are exactly the same. A striking illustration of

CLASSES OF NUTRIENTS.

The following are familiar examples of compounds of each of the four principal classes of Nutrients:

PROTEIN { *a* ALBUMINOIDS: *E. g.*, Albumen (white) of eggs; casein (curd) of milk; myosin, the basis of muscle (lean meat); gluten of wheat, etc.
b GELATINOIDS: *E. g.*, Collagen of tendons; ossein of bones, which yield gelatin or glue.

Meats and fish contain very small quantities of another class of compounds called "extractives" (the chief ingredients of beef tea and meat extracts), which contain nitrogen, and hence are commonly classed with protein.

FATS { *E. g.*, Fat of meat; fat (butter) of milk; olive oil; oil of corn, wheat, etc.

CARBOHYDRATES { *E. g.*, Sugar, starch, cellulose (woody fiber).

MINERAL MATTERS { *E. g.*, Calcium phosphate, or phosphate of lime; sodium chloride (common salt).

It is to be especially noted that the protein compounds contain nitrogen, while the fats and carbohydrates have none. The average composition of these compounds is about as follows:

	Protein.	Fats.	Carbohydrates.
Carbon	53 per cent.	76.5 per cent.	44 per cent.
Hydrogen ...	7 "	12.0 "	6 "
Oxygen	24 "	11.5 "	50 "
Nitrogen	16 "	None	None
	100 "	100.0 "	100 "

studies of materials used as food for man, aside from those referred to above as executed in behalf of the National Museum, and a series of investigations of the chemistry of food-fishes made for the United States Fish Commission. Much more work in this direction, including the more purely scientific study of the constitution of the materials, is, therefore, most pressingly needed. At the same time the analyses at hand, which have been used in compiling the figures of the diagram, will suffice to give a general and, I think, tolerably correct idea of the average composition of the materials. In some cases where American analyses are lacking, particularly of vegetable foods, I have used European analyses, of which a large number are on record.

I ought to say that different specimens of the same kind of food material may vary

the mutual replacement of water and fat may be seen in the case of the lean and the fat mackerel in Part II. of the double-page diagram of composition of food materials beyond.

widely in composition and that the analyses here given represent averages. Examples of these variations are shown in the cases of oysters and of mackerel in Part II. of the table. In these, however, the differences are unusually wide, although very considerable variations are found in other materials, especially in meats.

The diagram tells its story plainly, and I need now call attention to but few points. It is interesting to note, in Part I., the differences in the amounts of refuse and edible portion in the different kinds of meats, fish, etc., as they are ordinarily found in the markets. Thus in some of the specimens of beef, as the round steak, the bone and other inedible materials amount to only ten per cent. of the whole, whereas in the flounder the refuse amounts to two-thirds, and the edible portion to only one-third, of the whole. The bone, though counted here as refuse, yields, when properly boiled, a considerable quantity of nutritive matter, chiefly in the form of gelatine and fats. Fish, as we buy them in the markets, have on the average a larger proportion of refuse and less edible material than meats. Dairy products and most vegetable foods have very little refuse.

In examining the edible portion of the materials, as shown in Part II., it is interesting to note the wide variations in the proportions of water and of nutritive substances. In general the animal foods contain the most water and the vegetable foods the most nutrients, though potatoes and turnips are exceptions, the former being three-fourths and the latter nine-tenths water. Butter, on the other hand, though one of the animal foods, has on the average about nine per cent. of water. The milk from which it is made is not far from seven-eighths water. As stated above, meats have more water in proportion as they have less fats, and *vice versa*, the fatter the meat the less amount of water in it. Thus, very lean beef (the muscle of a lean animal from which the fat has been trimmed off) may have seventy-eight per cent. of water and only twenty-two per cent. of nutrients. The rather fat sirloin of the diagram has sixty, and the very fat pork only about ten per cent. of water. The flesh of fish is in general more watery than ordinary meats, that of salmon being five-eighths water; codfish, over four-fifths; and flounder, over six-sevenths. Flour and meal have but little water, and sugar almost none.

In examining the proportions of individual nutrients, protein, fats, and carbohydrates, the most striking fact is the difference between the meats and fish, on the one hand, and the vegetable foods on the other. The vegetable foods are rich in carbohydrates, starch, sugar,

etc., while the meats have not enough to be worth mentioning. On the other hand the meats abound in protein and fats, of which the vegetable foods usually have but little. Beans and oatmeal, however, are rich in protein, while fat pork has very little.

The comparative composition of oysters and milk is worth noting. Both contain about the same total amounts of nutrients, but the proportions are quite different, the oysters having the more protein, and the milk the more fat. Roughly speaking, we may say that there is not a very great deal of difference between the nutritive values of a quart of oysters and a quart of milk. Considering the cost, however, the oysters are far the more expensive food.

I have noticed that people in looking over such tables as this sometimes get at first a wrong impression. Thus rice contains about seven-eighths, and potatoes only one-fourth nutritive material. The first inference is that the rice is much more nutritious than potatoes. In one sense this is true; that is to say, a pound of rice contains more than twice as much nutrients as a pound of potatoes. But if we take enough of the potatoes to furnish as much nutritive material as the pound of rice, the composition and the nutritive values of the two will be just about the same. In cooking the rice we mix water with it, and may thus make a material not very different in composition from potatoes. By drying the potatoes they could be made very similar in composition and food value to rice. Taken as we find them, a pound of rice and three and a half pounds of potatoes would contain nearly equal weights of each class of nutrients and would have about the same nutritive value.

FLOUR AND BREAD.

THE composition of wheat flour and wheat bread are worth notice here. The chief difference is in the water, which makes about one-ninth the weight of the flour and one-third that of the bread. Of course different kinds of flour and bread vary widely in composition. The composition of wheat flour here stated is the average of a large number of analyses of American specimens, and doubtless represents very closely the average composition of the flour which people ordinarily buy. The figures for bread are the average of four analyses of loaves purchased at different times at bakeries in Middletown, Connecticut. They agreed very closely in composition with each other and with an excellent specimen of home-made bread. I infer, therefore, that this was better than the average baker's bread, a supposition confirmed by published analyses of the latter.

Where the ingredients amount to less than one-half of one per cent. they are omitted from this table.

INDICATED BY SHADED DEVICES.

EXPLANATIONS.—Of the different classes of nutritive ingredients or nutrients of food the protein compounds, "protein-formers," are the most important in the sense that they alone form the basis of the blood, muscles, tendons, and other important tissues of the body. Protein, fats, and carbohydrates of food are all transformed into the fat of the body and all serve as fuel to produce heat and energy (strength) for muscular work. As fuel, one part by weight of fat is estimated to be equivalent to over two parts of protein or carbohydrates. A proper diet will include all the nutrients in proportions fitted to the needs of the user.

PART II. MEATS, FISH, ETC., EDIBLE PORTION; DAIRY PRODUCTS; VEGETABLE FOODS.

¹ In respect to quantity of nutrients ² Mineral matters include salt.

which often show a much larger percentage of water, sometimes forty per cent. or more. In using the word "better" I do not refer to flavor, color, or texture, but to the proportion of nutrients and water. In making bread, a very little butter or lard and yeast and a good deal of water, by itself or in milk, are added to the flour. In the fermentation of the dough in rising, minor transformations take place in the carbohydrates, the chief being the change of sugar to carbonic acid gas and alcohol. In the baking, the alcohol and gases are mostly driven off, and part of the water goes with it. The chief difference between the flour and bread, therefore, is that the bread is more bulky, the gases having expanded it, and that it contains more water. In other words, in making flour into bread the baker renders it more palatable and increases the bulk and weight, but adds very little nutritive material. For him to manipulate it so as to get the most bulk and weight from the least flour is perfectly natural, and his loaf is apt to contain a large percentage of water and have considerable space inside filled with air and gas. The price of the bread per pound is apt to be twice that of the flour. When the poor man buys his pound loaf of bread of the baker for seven or eight cents he thus gets no more nutritive material than the well-to-do man obtains for three cents in the flour which he has baked at home. But if the poor man's family have no conveniences for making the bread, there is nothing left for them to do but buy it from the baker.

BUTTER AND OLEOMARGARINE.

WITHIN a few years past substitutes for butter have become a very important article of commerce. The most important of these, oleomargarine, agrees very closely in chemical composition with butter from cows' milk, the chief difference being that the oleomargarine contains smaller proportions of the peculiar fats, butyric, etc., which give butter its agreeable flavor. It is made by taking beef fat or lard, extracting part of the stearin, a material which is familiarly known in candles, and adding a small amount of butter to the residue. It is this small quantity of butter which gives the butter-flavor to the whole.

As will be explained when we come to consider the digestibility of foods, the difference in digestibility between butter and oleomargarine is at most too small to be of any considerable consequence for ordinary use. The nutritive values of the two are very nearly the same. In fulfilling one of the most important functions of food, that of supplying heat and muscular energy, butter and oleomargarine excel in efficiency all, or nearly all, of our other

common food materials; at least such is the outcome of the best experimental testimony. In appearance and flavor the common kinds of oleomargarine resemble butter so closely that it is difficult even for an expert to distinguish between them.

These butter substitutes are manufactured at very low cost, so that they can be sold at retail at about half the price of butter. They are, therefore, food products of large economic importance and of great benefit to that large class of our population whose limited incomes make good dairy butter a luxury, and, for that matter, to all who need to economize in their living expenses.

Like many other manufactured food products, oleomargarine is liable to be rendered unwholesome by improper materials and methods of manufacture. Butter, likewise, is often improperly made and is liable to become unwholesome. In the considerable mass of evidence which has come under my own observation there is no indication that butter substitutes, as they are actually sold in our markets, average less wholesome or healthful or are in any way less fit for human food than ordinary butter, though some observers in whose judgment I have confidence are inclined to think that on the whole the advantage as regards wholesomeness is somewhat in favor of butter. Among the chemists who are recognized as authorities in these matters, both in this country and in Europe, there is very little difference of opinion as to the value of oleomargarine for food.

There is, however, a popular prejudice against imitation butter which is very unfortunate, especially for people in moderate circumstances and for the poor, whom it is most calculated to benefit. This prejudice, which a new food material very naturally meets, is fostered, and often conscientiously, by representatives of the dairy interest, which fears from imitation butter a damaging competition, though the most accurate statistics show it to be far less serious than is generally believed. On the other hand, the benefit which butter substitutes are calculated to bring is largely prevented, and an immense wrong is done by the very general sale of the imitation under the guise and name and at the price of butter.

In a number of States in which the dairy interests are large, the manufacture and sale of butter substitutes has been prohibited by legislative action. In other States laws have been enacted to regulate their sale and prevent fraud. An attempt was made in Congress to check the manufacture and sale by taxation sufficient to bring their cost nearly up to that of butter. In the law as actually passed, however, the tax was very much reduced, so that

while it may help toward preventing improper sale of butter substitutes and, by obliging sellers to pay high license fees, may considerably interfere with their general use, it will not be as effective in excluding them from the markets as was desired.

This is a case where mechanical invention aided by science is enabled to furnish a cheap, wholesome, and nutritious food for the people. Legislation to provide for official inspection of this, as of other food products, and to insure that it shall be sold for what it is and not for what it is not, is very desirable. Every reasonable measure to prevent fraud, here as elsewhere, ought to be welcomed. But the attempt to curtail or suppress the production of a cheap and useful food material by law, lest the profits which a class, the producers of butter, have enjoyed from the manufacture of a costlier article may be diminished, is opposed to the interests of a large body of people, to the spirit of our institutions, and to the plainest dictates of justice.*

In discussing the composition of our foods we must consider not only the quantities of nutritive ingredients which they contain, but also the part each one of these classes of nutrients has to perform in the nourishment of the body, and the proportions which are appropriate for the diet of different persons.

The protein compounds, sometimes called "muscle-formers," are the only ones which contain nitrogen. According to the best experimental evidence they alone form the basis of blood, muscle, tendon, and other nitrogenous tissues of the body. As these tissues are worn out by constant use they are repaired by the protein of the food. The protein, fats, and carbohydrates are all transformed into fat. They all seem to share, therefore, in the formation of the fat of the body. They all likewise serve as fuel to maintain the heat of the body and to yield muscular energy for its work. Late experiments indicate that in those serving as fuel, one part by weight of fats is equivalent to a little over two parts of either protein or of carbohydrates. The mineral matters make up a large part of the bones and teeth, small proportions are contained in the other tissues, and they are necessary for nutrition in various other ways.

It is a fundamental principle of food economy that the diet should contain nutritive material adapted to the wants of the consumer.

A great deal of experimenting and observation have been devoted to the determination of the quantities of protein, fats, and carbohydrates needed for the daily nourishment of individuals of different age and sex, at work or at rest, and subject to the varied conditions of life. In Germany, where the subject has been most thoroughly studied, it has come to be commonly accepted that about 4.2 ounces of protein, 2 ounces of fats, and 17.6 ounces of carbohydrates will make a fair daily ration for a laboring man of average weight and doing moderate work. Of course he can get on with less of one if he has more of the others. But there is a minimum below which he cannot go without injury, and his amount of protein should not fall much below the 4.2 ounces per day, though protein, as we shall see later on, is by far the costliest of the nutrients. In animal foods, furthermore, it is usually associated with the so-called extractives, which have a peculiarly agreeable flavor. In accordance with one of those universal processes of natural selection which science is gradually helping us to understand, the food of the poor is apt to contain too little protein and that of the rich too much.

The flesh of codfish contains, aside from water, little else than protein, butter is almost wholly fat, and sugar and starch are carbohydrates. The lean meats are similar to codfish; fat pork resembles butter, and the chief nutrient of potatoes and rice is starch. Each of these materials is unfit by itself for nourishment. Milk, on the other hand, abounds in all the nutrients and is more nearly a "perfect food," for those with whom it agrees, than any other animal food material. While meats and fish are rich in protein, and most meats and some fish abound in fats, the vegetable foods generally lack protein and fats but have an excess of carbohydrates, of which the meats and fish have none. Beans and pease, however, have a good deal of protein.

We have here a very simple chemical explanation of a usage which, under the promptings of experience or instinct, mankind has almost everywhere come to adopt,—that of supplementing wheat and corn and rice and potatoes with meats and fish, or, when these are lacking, by beans, pease, or other vegetables rich in protein. There is a sound reason in the Hindu's practice of eating pulse with rice, in the Irishman's use of skimmed milk with his potatoes, in the Scotchman's

*The following is from the late report of the Dairy Commissioner of Connecticut, which comes to hand just as this is being written:

"As a protection to consumers the national law is a failure, and the present tax is too small to benefit our dairies to any appreciable extent; a ten cent tax

might more nearly have accomplished what the national law was intended to accomplish, but as matters now stand the national law is simply a source of revenue to the national government, and practically levies a tax on poor people who can ill afford to bear it."

partiality for oatmeal, haddock, and herring, and in the frugal New England diet of cod-fish and potatoes and pork and beans.

Reserving further consideration of these subjects for future articles, I may briefly recapitulate some of the main points already considered.

First. Our bodies and our foods consist of essentially the same kinds of materials.

Second. The actually nutritive ingredients of our food may be divided into four classes: protein, fats, carbohydrates, and mineral matters. Leaving water out of account, lean meat, white of egg, casein (curd) of milk, and gluten of wheat consist mainly of protein compounds. Butter and lard are mostly fats. Sugar and starch are carbohydrates.

Third. The nutrients of animal foods consist

mainly of protein and fats. Those of the vegetable foods are largely carbohydrates. The fatter kinds of meat and some species of fish, as salmon, shad, and mackerel, contain considerable quantities of fat. The lean kinds of meat and such fish as cod and haddock contain very little fat. Beans, pease, oatmeal, and some other vegetable foods contain considerable quantities of protein.

Fourth. The different nutrients have different offices to perform in the nutrition of the body. The demands of different people for nourishment vary with age, sex, occupation, and other conditions of life. Health and pecuniary economy alike require that the diet should contain nutrients proportioned to the wants of the user.

W. O. Atwater.

IF.

IF he had known that when her proud fair face
Turned from him calm and slow
Beneath its cold indifference had place
A passionate, deep woe.

If he had known that when her hand lay still,
Pulseless so near his own,
It was because pain's bitter, bitter chill
Changed her to very stone.

If he had known that she had borne so much
For sake of the sweet past,
That mere despair said, "This cold look and
touch
Must be the cruel last."

If he had known her eyes so cold and bright,
Watching the sunset's red,
Held back within their deeps of purple light
A storm of tears unshed.

If he had known the keenly barbéd jest
With such hard lightness thrown
Cut through the hot proud heart within her
breast
Before it pierced his own.

If she had known that when her calm glance
swept
Him as she passed him by
His blood was fire, his pulses madly leapt
Beneath her careless eye.

If she had known that when he touched her
hand
And felt it still and cold
There closed round his wrung heart the iron
band
Of misery untold.

If she had known that when her laughter rang
In scorn of sweet past days
His very soul shook with a deadly pang
Before her light dispraise.

If she had known that every poisoned dart —
If she had understood
That each sunk to the depths of his man's heart
And drew the burning blood.

If she had known that when in the wide west
The sun sank gold and red
He whispered bitterly, " 'Tis like the rest;
The warmth and light have fled."

If she had known the longing and the pain,
If she had only guessed,—
One look — one word — and she perhaps had
lain
Silent upon his breast.

If she had known how oft when their eyes met
And his so fiercely shone,
But for man's shame and pride they had been
wet —
Ah! if she had but known!

If they had known the wastes lost love must
cross,—
The wastes of unlit lands,—
If they had known what seas of salt tears toss
Between the barren strands.

If they had known how lost love prays for
death
And makes low, ceaseless moan,
Yet never fails his sad, sweet, wearying
breath—
Ah! if they had but known.

Frances Hodgson Burnett.

A SONG OF FLEETING LOVE.

LOVE has wings as light as a bird,
Guileless he looks, as a dove, of wrong;
Whatever his song, be it brief or long,
It still has this for an overword:

Love has wings!

Though to-day the truant may stay,
Though he woos and sues and sings,
Only sorrow to maids he brings;
Pout him and flout him, laugh him away:

Love has wings!

Hold your pulses calm, unstirred —
Calm and cool as a woodland pool,
Let not his song your heart befool;
List, through it all, for the overword:

Love has wings.

Alice Williams Brotherton.

PERSONAL RECOLLECTIONS OF LOUIS BLANC.

WITH NOTES CONCERNING ALSACE AND LORRAINE.

IN Louis Blanc France not only lost the last surviving great leader of the time of the Second Republic, but also the ablest expounder of the "History of Ten Years" of Louis Philippe's government; the best re-

cent inquirer into the doings and the real aims of the personages of the Great Revolution; and at the same time a man who during all his life had striven to better the lot of the laboring masses. The product of his youth, "The Organization of Labor," may be subjected to a legitimate criticism; the generosity of his aspirations does not admit of any doubt.

I first made his acquaintance during a temporary sojourn in London, in September, 1849. I still see him before me, with most lively recollection, as in his apartment, in Piccadilly, near Hyde Park, he stood with folded arms before the chimney. A very small but well built and even neatly proportioned man; of almost Napoleonic cast of features, such as may be found among not a few Corsicans; quite beardless, which in those later revolutionary days was a rare thing. The glance of his black, somewhat protruding eyes, lustrous, and verging upon a dazzling changefulness; the thick dark-brown hair long and falling down straight; the color of the face rather brownish. In spite of the smallness of his stature — for he was not higher than Thiers — an impressive appearance, only diminished in walking by the slightly bent leg. He was clad, rather conspicuously, in a light blue dress-coat with gilt buttons, and a waistcoat with broad flaps, the so-called Robespierre vest. The garb was a reminiscence of the first Revolution.

In his intercourse with Englishmen Louis

Blanc displayed all his social qualities to great advantage. He was among the very few Frenchmen who spoke and wrote in English, and who liked to learn from a nation which possesses a noble and powerful literature exercising influence all over the world — even as its political power is felt, sometimes for good, sometimes for evil, throughout the inhabited globe. Louis Blanc was in friendly relations with a number of prominent English authors and politicians of the most different party views. I will only name John Stuart Mill, the late Lord Bulwer Lytton, Thackeray, Hepworth Dixon, Thomas Hughes, and Lord Houghton. English affairs he treated, upon the whole, in his letters as a publicist, with great independence, and with an evident desire to be just in every direction.

In society, the smallness of his stature, combined with the youthfulness of his visage and his habit of shaving the whole face, several times led to very exhilarating scenes. Even many years after his arrival in England, he was repeatedly mistaken for a youngster. A relative writing to me from Germany just reminds me of the following laughable, but highly inconvenient, incident: "Do you remember the dinner at your house, when we all waited so long, and in vain, for Louis Blanc? Your Irish housemaid had sent the 'boy' away, saying that you were engaged!" Another dinner had to be arranged, in order to give my German relative a chance of meeting Louis Blanc. When Louis Blanc's publisher died, and he temporarily found himself rather in financial straits, lectures were arranged for him, at my suggestion, in our St. John's Wood Athenæum. "Mysterious Personages and Agencies before the French Revolution" was their title. Quite a crowd of literary and political celebrities were expected. By an over-

sight, Louis Blanc, on this his first appearance as a lecturer in the English language, himself almost became a mysterious personage to the distinguished audience, the desk being so high that his head would scarcely have been visible! Fortunately, in the nick of time, a foot-stool was provided, on which he stood all the while when speaking. The somewhat constrained attitude imposed upon him thereby perhaps accounts to some extent for the rather formal and academic manner of his delivery. In the French Assembly, too, he had to make use of a stool.

His eloquence had altogether something of the pulpit. One might almost fancy that his earliest training (a relative had intended him to become a priest) had left some mark upon him. There was something exceedingly measured in his talk as soon as he began to enter upon a serious discussion.

His full-sounding utterance, clearly distinct in every syllable, reminded the hearer a little of the southern French amplitude of vocalization. It was matched by the clearness and elegant firmness of his large and open handwriting. "Ah!" he would say to hasty admirers, "that is just my misfortune. Don't you see, it is because my manuscripts are so beautifully written that they are given to the worst compositors. That is how the many misprints occur, which so vex me!"

In general intercourse he was the very type of amiability and politeness. Of the most dignified and exquisite bearing before strangers, he was fond of unbending before friends, often showing a hilarity which broke into harmless loud laughter. But never did he intentionally give pain to any one in conversation by his remarks.

As towards the English, so he also felt greatly attracted towards Germans; but he never mastered, or even attempted to study, our tongue. During the Schleswig-Holstein war he gave a public and very useful proof of pro-German sympathy, although he thereby offended not a few English friends. The most influential section of the public opinion, and the majority of the statesmen of England, were on the Danish side. The Palmerston ministry sought to form an alliance with Napoleon III. for an armed attack against Germany. It was of the utmost importance to oppose these designs both in London and Paris. For years, the writer of these "Recollections" had been at the head of a propagandistic National and Democratic Association of Germans in England ("Society for German Freedom and Union") which had made the Schleswig-Holstein question its specialty. Confidential memoranda, written by the two chief leaders of the Schleswig Parliament, but

which they dared not even sign for fear of Danish persecution, had repeatedly been transmitted by me to Lord John Russell, the foreign secretary, by way of authentication. In Lord John Russell's organ, the (then Liberal) "Globe," I often took occasion to explain, above my signature, the grievances and aspirations of the Schleswig-Holstein people, as previously expressed in its three years' unsuccessful war of independence (1848-51). Now, Louis Blanc, who during the new national war (1863-64) almost daily came to see me for purposes of information, generously expounded the same views in his letters to the Paris "Le Temps" which afterwards were collected in a number of volumes entitled "Lettres sur l'Angleterre." We Germans really owed him gratitude for that.

During all the long years of intimacy with Louis Blanc in England, our political relations always remained undisturbed by the slightest cloud. As a token of his never-changing sentiments, I have before me many volumes of his different works with friendly inscriptions. Once, when I and my wife were for several days as guests in his house at Brighton, I was informed from abroad that in one of Louis Blanc's letters to "Le Temps" there was a passage unjustly bearing upon German rights in the Rhinelands. It was painful to refer to such a matter at that particular moment. Upon consideration I yet thought it to be best — nay, even a duty — to do so. He was quite unhappy when I addressed the question to him point-blank. He at once fetched all the numbers of "Le Temps" which he had collected, and declared he was utterly unable to conceive the reproach.

For safety's sake, with a view to possible contingencies in the future, I, however, entered upon a full discussion of the ideas then held on that subject by most Frenchmen, and formerly, no doubt, also by him. In the course of the conversation he suddenly observed that "in case of a difference, a question as to the frontier might, after all, be solved by a popular vote." I replied that "Germany could never so far forget her dignity as a nation, or her historical rights drawn from community of blood and speech, and ancient possession, as to allow a vote to be taken on the question as to whether that portion of her people who dwell on the left side of one of her rivers should continue to form part of the Fatherland!" Louis Blanc easily understood the point, and thus the matter was disposed of.

Few know how deeply even French Democracy had been tainted with the ideas of further conquest in the direction of the Rhine. One day a Frenchman of my acquaintance, who semi-officially represented President Jua-

rez and the Mexican Republic in London during the time of the war against the Napoleonic invasion, and with whom I had been on most friendly terms, unexpectedly broke forth in my own house, before German friends, in this way:

"If once we have the Republic in France, we shall march on the Rhine, even if we were to get all Germany on our back!" (*même si nous aurions toute l'Allemagne sur le dos.*)

"Mind!" I replied to him, "if once you have her on your back, you will not get her off again easily!"

During the struggles of the Prussian House of Commons against the budgetless and arbitrary government of Herr von Bismarck, Louis Blanc, in "*Le Temps*," supported the German Progressist and popular parties. Ferdinand Lassalle, the so-called German "revolutionary agitator" who took sides against the Prussian House of Commons, thus practically sustaining Bismarck, confidentially asked Louis Blanc, one day, for a public letter of sympathy with his socialist agitation. It was to be a sort of certificate or pass for Lassalle among our working classes. At that time Lassalle generally was looked upon as an extreme Republican aiming at a great social overthrow. For my part, I from the beginning considered him a mere ambitious Cautinarian. I thought, nay, I knew, that he, in secret collusion with the government, endeavored to traverse the aspirations of the liberal middle class, so that a despotic kingcraft in the pseudo-socialist "Grand Almoner" style might be established, which would hide its true character, like the Second Napoleonic Empire, under democratic phraseology. I expressed this view to Louis Blanc when he asked my advice as to what he should do in reply to Lassalle's wish.

"Why, he practically acts as an agent of Bismarck," I said. "I should not wonder if he played the part of a Persigny, aiming at office."

"Impossible!" Louis Blanc replied. "Do you mean this seriously?" "Very seriously," I answered. In fact, I had given similar warning in public by a fly-sheet against Lassalle, under the title, "A Friendly Word to Germany's Workmen, Burghers, and Peasants." It took some time, however,—indeed, a conversation of several hours,—before Louis Blanc could be made to understand all the bearings of the case. His own former intercourse with the captive of Ham still played him an occasional mental trick in questions of mixed political and social import. Afterwards he said he was grateful for having been prevented from falling into the trap laid for him.

The secret dealings of Lassalle with Bismarck were, in later years, revealed by the

German Chancellor himself, in a speech in the Reichstag. My own informations had long ago pointed that way.

Quite recently a letter has come to light, written by Lassalle to the well-known conservative and orthodox Professor Huber, whose semi-socialist views had been made use of by Prince Bismarck. In this letter, written during the full flush of his alleged "revolutionary" agitation, he begins by saying that he had been a Republican from his youth, but that he would be proud now to bear the banner of a "Socialist Royalty."

During the rising in Russian Poland, when I was in connection with the diplomatic representative in London of the Secret National Government at Warsaw, Louis Blanc warmly espoused the Polish cause. It was Mazowiecki who had first introduced Mr. Czerwinski to me. Through him I learnt beforehand the very date on which the intended rising was to begin; and the information turned out quite correct. German advanced Liberals and Republicans strongly favored the Polish cause. Being called to Scotland to address public meetings there at Glasgow, Stirling, and Hawick, I succeeded in bringing about petitions to the English Parliament in support of that cause. Louis Blanc, as may be seen from his "*Lettres sur l'Angleterre*," took these meetings as a text for his own writings.

Some years afterwards, a review in the London "*Athenæum*" endeavored to make out that Louis Blanc had been favorable to a French war on the Rhine, which might lead to a change of frontiers in connection with the Polish question. I at once wrote to him as to how matters stood. He replied:

"BREVETTES, 25 Grand Parado, 31 Juillet, 1867.

"MON CHER AMI: Je vous envoie les deux premiers volumes de mes '*Lettres sur l'Angleterre*.' Je suis malheureusement pas en ce moment, les 3e et 4e volumes. J'ai écrit à mon éditeur de Paris de vous faire tenir quelques exemplaires. J'en envoie un de plus pour vous, d'autant plus que vous y trouverez trois lettres qui vous concernent.

"Je n'ai jamais conseillé à Napoléon d'envahir les Provinces rhénanes; mais j'ai très franchement exprimé le désir que la France s'abstînt pas la Pologne, du moins pour cela, et à défaut de tout autre moyen, faire la guerre au roi de Prusse, complice de l'empereur de Russie dans l'agression des Polonais.

"La phrase citée dans l'*Athenæum* est exactement citée; mais le sens en est déterminé par le contexte de la lettre d'où elle est tirée, conclusion que vous. Je copie la traduction anglaise, n'ayant pas l'original sous les yeux:

"PARIS, 22, 1867.

"What shall we desire? What shall we hope? It rests, perhaps, with the liberal party in Prussia to *show aside the genius of conquest* while serving the interests of justice with a courage worthy of the cause. The Prussian liberals can do much for Poland—they can do everything, perhaps; and therefore, at this moment, their responsibility in the eyes of the world is immense. By the military convention, the object of such general

and vehement protests, it is not only Russian Poland that is stricken, but Prussian Poland is outraged. The support of the Polish deputies in the Berlin Parliament cannot therefore be wanting to the German deputies, if the latter will understand that the true interests of their country are indissolubly bound up in this instance with the triumph of justice. Should the energy of their attitude and the potency of their efforts facilitate a result *that will respond to the sympathies of the friends of freedom, without exciting their fears*, they will render an inestimable service to Europe, for which England above all others will entertain an eternal gratitude. May Heaven inspire them! The question at issue is to secure *for the principle of liberty, and for it alone*, the glory of having falsified the prediction falsely ascribed to Kosciusko: *Finis Polonia.*

"Salut cordial.

"LOUIS BLANC."

"I have never advised Napoleon to annex the Rhinelands; but I have very strongly expressed the wish that France should not forsake Poland, even if, for that purpose, and in the absence of any other means, she had to make war against the King of Prussia, the accomplice of the Emperor of Russia in the slaughtering of the Poles." This sentence of Louis Blanc, directed as it was against the disgraceful convention concluded between the Prussian King and the Czar, seemed to me to contain a dangerous theory for all that. Would it have been the right thing for Germany to declare war against France on account of the annexation of Garibaldi's birthplace? If not, what right had Napoleon III., of all rulers, to make war upon the "King of Prussia"—which, after all, could only be done on German territory on the Rhine—for the alleged sake of Poland, but in reality for the purpose of a fresh annexation, similar to that of Savoy and Nice, which was the result of a so-called deliverance of Italy "from the Alps to the Adriatic"? Again, would not a successful war of that kind have riveted the Bonapartist yoke upon France even more firmly?

I discussed these matters repeatedly, and very earnestly, with Louis Blanc. I told him that, in spite of the deep estrangement between Prussia and Southern Germany on account of the war of 1866, all our countrymen would stand shoulder to shoulder as soon as a French army were to move upon our Rhinelands. I said that I would be the first, in such a case, to call out for the laying aside of party divisions for the purpose of common defense; and that, moreover, I was convinced of victory being on our side. This latter view, especially, was one which Frenchmen of all political descriptions could with difficulty be brought to accept then.

"For the sake of your own country, for the sake of our common cause of freedom and civilization, I pray you to exert yourself with all your power to dispel the illusions in which so many of your countrymen still indulge!" I

over and over again said to Louis Blanc, to Ledru-Rollin, to Savoye, to Dupont, to Lefèvre, to Fonvielle, to Valentin, and others. And Louis Blanc was brought gradually to comprehend the full extent of the danger of a war with the "Prussians," as the French, in their infatuation, would then and long afterwards say.

In the American war, Louis Blanc advocated the cause of the Union; at first, somewhat cautiously, afterwards with growing energy. His caution may partly have arisen in the beginning from a certain desire not to hurt too strongly the deplorable prejudices by which the majority of the governing classes in England were influenced; the *Trent* affair, in which we pleaded for America the right of self-preservation, even though its government would no doubt make diplomatic amends to England. Louis Blanc at first gave the reasons for and against, with great deliberateness in the "Temps," and without committing himself. In every English house we had then to fight for the cause of the Republic. A second motive for Louis Blanc's caution, in the beginning, was the delay of an emancipation decree.

"Why not proclaim emancipation at once," he said, "and thus strike a mortal blow at the South?"

Like most of his countrymen, he was not aware of the complex state of political parties in the North. He had not, until then, devoted much study to American affairs. Being fully agreed with him as to the foul blot of slavery, I still could understand, even if I greatly regretted, the dilatory procedure of President Lincoln's government.* A spur was, however, required, now and then, to arouse the sometimes flagging enthusiasm of our friend, whose utterances were closely watched by Englishmen. After a while, he rapidly went ahead, doing right good service to a cause upon which the hopes of the best thinkers of Europe centered.

I vividly remember the day when the terrible news of the assassination of President Lincoln reached London. The address of sympathy which I had forthwith proposed, and signed, in common with Freiligrath, Kinkel, and other Germans of London, was scarcely dispatched to the American embassy when Louis Blanc came to see me. His face bore the evidence of great mental distress. He seemed to think that the cause of the Republic itself was once more in danger. On hearing of our manifestation, he immediately drew up a letter of his own, expressing sympathy

* On this point we hope Mr. Blind will read Nicolay and Hay's "Abraham Lincoln: A History."—THE EDITOR.

with the loss experienced by the American nation.

The political serfage under which his country groaned meanwhile bore heavily upon his national and civic pride. When some signs of a revival of the opposition spirit at last exhibited themselves, he wrote to a French friend, M. Ferragus, who had visited him in his home, in Melina Place, St. John's Wood:

"If only you knew what humiliations we have had to swallow as Frenchmen during that long banishment which, if it should continue five years longer, will have lasted exactly a quarter of a century! How sad to hear on foreign soil wherever you present yourself: 'We pity you; but as to France, how could we pity her? She has at last found the man that was wanted for her repose and for our own. The French people are a people of children, and, what is worse, of dangerous children. It is well that the means of setting fire to the house has been taken from them. France is not made for freedom; and she feels this so well herself that she has perished by accommodating herself to servitude. Freedom is only fit for us Englishmen, who are men.' What torture is comparable to that which such insolent, cruel language inflicts upon a Frenchman living among those who hold it! Now, for twenty years, we have had to drink the cup of such insults to the very dregs."

In the course of the same letter, Louis Blanc says that he always had declared that "France, in spite of appearances, was always the great and mature nation, the manly nation which, at another epoch, had been the admiration of the world; that to believe her to be dead was to calumniate her slumber; and that she would awake prouder, nobler, more powerful than ever." In the meanwhile, "exile was for the proscribed a moral agony, the sufferings of which baffle description."

Events unfortunately did not justify his forecast. Instead of working out her internal revival by the strength of the popular forces, France allowed herself to be led on the war-track, when she only gained her Republican freedom at the expense of necessary defeat.

He opposed with all his power, so far as in him lay, Napoleon's war venture of 1870. His acquaintance with Germans in London had enabled him to perceive the tremendous risks which France ran. Not many weeks before the declaration of war, he, with his brother Charles, and a Progressist member of the Prussian House of Deputies, and Mr. and Mrs. Hepworth Dixon, and a number of other friends, were at dinner in our house. We spoke of the question of a people's education and its bearing upon political affairs.

"I shall never forget," said Charles Blanc,

"how Durny [Napoleon's Minister of Public Instruction] one day led me into a side-room of his office, showing me the 'Map of Ignorance' of our country. The departments in which most people can read and write were in white color; those less advanced, in grey stripes; those most backward, in black. What a shock it gave me! So many departments were black—or nearly so. You in Prussia are in that respect far ahead of us."

"In Germany!" I answered.

"Indeed, I thought it was a specially Prussian institution, this compulsory law of education."

"No; it is the same all over our Fatherland!" I replied.

He seemed to take mentally a taste of it. The dinner passed off most pleasantly, until we spoke of ancient and modern Greece—a theme I thought peculiarly pleasant to him as an enthusiastic admirer of and writer on Hellenic art and antiquities. Unfortunately, the question of the mixed race—descent of the present Greeks—was touched. Thereupon Charles Blanc all at once flew into a perfect passion, though everybody present was a warm well-wisher of the "greater future" of the Greece of our days. Neither for the past nor for the present would Charles Blanc, in spite of the fullest classic and later historical testimony, admit any alloy in the blood of the Greeks: not a Pelagian, not a Thracian, not a Phœnician, not a Slavonian admixture—nothing but pure "Hellenic" descent.

The conversation grew warm, on his part at least, beyond English custom. One of the ladies was so startled by his energy that she became ill, and had to leave the room. It was as if Charles Blanc—whom his brother in vain endeavored to restrain—were fighting some imaginary foe of his own country. The contrast to his usual amiability was incomprehensible. A nervous electrical storm seemed to have got possession of him.

A few days before the declaration of war by Napoleon III. against "Prussia," we were at dinner in Louis Blanc's house. A number of Frenchmen, Englishmen, Americans, were present, as well as the late Belgian Consul, M. Delepierre, who in spite of his French name had a very good "Nether-German" or Flemish heart. He was an able and well-known writer on Flemish literature. The question of war or peace was now uppermost in all men's minds and conversation. Suddenly Charles Blanc, while deprecating war, said he did not mean thereby to give up the right of France to the Rhenish Provinces which we have possessed before (*"que nous avons eues"*).

"How long?" I asked.

He would not enter on the question. I had

often found that the best educated Frenchmen were really ignorant of history in that respect, and that they sometimes did not even know how purely German the population of those provinces was in speech.* All the politeness and amiability of Charles Blanc had returned. He acknowledged that he had been wrong. On his saying that France had possessed the Rhinelands before, the Belgian consul had significantly put in the remark:

"And how about the connection of Alsace and Lorraine with Germany in former times?"

In this way, there was sheet lightning, indicating coming things, even on occasions of pleasant social intercourse.

Louis Blanc, in the meanwhile, strove ceaselessly, in his letters to the French press, to warn his country against the declaration of war. At last they would not even hear him any longer in the Liberal opposition press. "These are the manuscripts of letters returned to me, unpublished!" he said one day, pointing out his rejected labor, in great grief.

It may not be amiss to bring to recollection that when Napoleon III. asked for the war-credits, Gambetta, Jules Ferry, Jules Simon, Magnin, Dorian, Steenackers, as well as Thiers—all men who came to power after Sedan—all voted for the war-credits, in spite of previous opposition speeches. Jules Favre, after 1866,—that is to say, after a disruption in the national body of Germany,—had considered France entitled to an "indemnification," in the way of a cession of Germany territory! So did Victor Hugo! At first, Thiers merely objected to the war of 1870 because he thought "France was not sufficiently prepared." Thiers cast his vote against declaration of war, first, last, and ever.

After the war was in full course, Louis Blanc, it is true, finally voted against the Treaty of Peace, which involved the cession of territory. This, however, could only signify a personal protest. He knew too well that the sword of France was broken.

When the war was over, we again met repeatedly in London and Brighton, where we were together for several weeks in most friendly and intimate intercourse.

He had a great deal to tell then as to the Commune insurrection. That rising, in Prince Bismarck's view, had a "legitimate kernel," overlaid by madness and horror.

A further element in the insurrection of the Commune was the desire to save France from a new Royalist reaction, as planned by the Assembly at Bordeaux. Louis Blanc endeavored to bring about a compromise and an amnesty; feeling repelled, as he did, on the one

hand, by the wild vagaries of the Commune, and out of sympathy, on the other, with the reactionists of the Assembly, in which he yet had to continue as a member. "If men like you leave us," Grévy very justly said to him, "the reactionists will get free scope!" But the wildest attacks were made upon Louis Blanc from both sides. Ultras of the Commune bespattered his character in the most hideous manner. He bore it all quietly.

In the conflagration of Paris, which marked the last stage of the reign of the Commune, Louis Blanc lost a great many movables and valuable things, provisionally stored up, during the siege, at a railway station. His most painful loss was that of the manuscript of a new work he intended to bring out: "The Salons of the Eighteenth Century." I believe it was founded on the lectures he had formerly given in England on the same subject. The manuscript perished in the flames. Seeing France defeated after a war against which he had in vain protested, and democracy deeply rent by internal divisions, he scarcely alluded to his own personal losses. The calumnies heaped upon him he repaid by working, at the expense of his health, in common with Victor Hugo, Clémenceau, and Camille Pelletan, for an unconditional amnesty of the exiles and prisoners of the Commune.

Under Marshal MacMahon's government I once was in a position to make an early communication to him, from an excellent source, by way of warning the Republican party against a lawless surprise. Of this communication, I believe, he made good use among the advanced Left of the Chamber of Deputies, of which he was the head. On his part, when referring to Gambetta, he expressed himself before me in words of great mistrust towards that highly ambitious leader. He looked upon him as a danger to the Commonwealth. So far back as 1872, Louis Blanc showed me the proof, in writing, of a move he had made among the advanced Left against Gambetta's policy. The paper in question bore the signatures of a number of Louis Blanc's intimate political associates. My own views in regard to Gambetta's aspirations towards "personal government" fully coincided with, if they did not even go much beyond, his own. It was after I had broached this subject, that Louis Blanc, at Brighton, suddenly took from the breast-pocket of his coat the paper in question, giving it to me for confidential perusal. Both Louis Blanc and Gambetta having gone now, I can openly bear testimony to a fact which is calculated to shed light on contemporary history.

Conquest of Lorraine and Alsace," by Henry M. Baird, in this magazine for February, 1871.

LOUIS BLANC. FROM A PORTRAIT BY A. MOULIN.

Louis Blanc felt keenly the manner in which he was neglected when his old friend Grévy became President of the Republic. He was placed under the ban of the Opportunists who now are prepared to crowd flowers upon his tomb. Being fond of England he wished to be sent to London as ambassador. When Chasselmeil Lacour was gazetted to that post, Louis Blanc turned his face to the wall to die. He ceased to struggle against terrible infirmities. The painful illness and death of his brother Charles was a blow from which he never recovered. Death, as Victor Hugo said, was, in the case of Louis Blanc, a deliverance.

Charles Blanc had died early in 1882. The two brothers were known to be bound up by a fraternal love of extraordinary warmth. It is said that when Louis Blanc, before the Revolution of 1848, was the object of a murderous attack, Charles, living far away in another part of France, exclaimed almost at the same hour that some dreadful accident must have happened to his brother: — which indeed turned out to be true. Whatever the explanation of this occurrence may be, Dumas made use of the oft-repeated story in his "*Corsican Brothers*"; the Blancs being, as before stated, of Corsican descent from the mother's side.

THE BORDER CONFLICT.

WILSON SHANNON. (AFTER AN ENGRAVING BY T. DONEY.)

KANSAS IN CIVIL WAR.

OUT of the antagonistic and contending factions mentioned in the last two chapters, the bogus legislature and its Border-Ruffian adherents on the one hand, and the framers and supporters of the Topeka Constitution on the other, grew the civil war in Kansas. The bogus legislature numbered thirty-six members. These had only received, all told, 619 legal *bonâ fide* Kansas votes; but, what answered their purposes just as well, 4408 Missourians had cast their ballots for

them, making their total constituency (if by discarding the idea of a State line we use the word in a somewhat strained sense) 5427. This was at the March election, 1855. Of the remaining 2286 actual Kansas voters disclosed by Reeder's census, only 791 cast their ballots. That summer's emigration, however, being mainly from the free States, greatly changed the relative strength of the two parties. At the election of October 1st, 1855, in which the free-State men took no part, Whitfield, for delegate, received 2721 votes, Border Ruffians included. At the election for members of the Topeka Constitutional Convention, a week later, from which the pro-slavery men abstained, the free-State men cast 2710 votes, while Reeder, their nominee for delegate, received 2849. For general service, therefore, requiring no special effort, the numerical strength of the factions was about equal; while on extraordinary occasions the two thousand Border-Ruf-

fian reserve lying a little farther back from the State line could at any time easily turn the scale. The free-State men had only their convictions, their intelligence, their courage, and the moral support of the North; the conspiracy had its secret combination, the territorial officials, the legislature, the bogus laws, the courts, the militia officers, the President, and the army. This was a formidable array of advantages; slavery was playing with loaded dice.

With such a radical opposition of sentiment, both factions were on the alert to seize every available vantage ground. The bogus laws having been enacted, and the free-State men having, at the Big Springs Convention, resolved

* Copyright by J. G. Nicolay and John Hay, 1886. All rights reserved.

on the failure of peaceable remedies to resist them to a "bloody issue," the conspiracy was not slow to cover itself and its projects with the sacred mantle of authority. Opportunely for them, about this time Governor Shannon, appointed to succeed Reeder, arrived in the territory. Coming by way of the Missouri River towns, he fell first among Border-Ruffian companionship and influences; and perhaps having his inclinations already molded by his Washington instructions, his early impressions were decidedly adverse to the free-State cause. His reception speech at Westport, in which he maintained the legality of the legislature, and his determination to enforce their laws, delighted his pro-slavery auditors. To enlist further his zeal in their behalf, a few weeks later they formally organized a "law-and-order party" by a large public meeting held at Leavenworth. All the territorial dignitaries were present; Governor Shannon presided; John Calhoun, the Surveyor-General, made the principal speech, a denunciation of the "abolitionists" supporting the Topeka movement; Chief-Justice Lecompte dignified the occasion with approving remarks. With public opinion propitiated in advance, and the governor of the territory thus publicly committed to their party, the conspirators felt themselves ready to enter upon the active campaign to crush out opposition, for which they had made such elaborate preparations.

Faithful to their legislative declaration they knew but one issue, slavery. All dissent, all non-compliance, all hesitation, all mere silence even, were in their stronghold towns, like Leavenworth, branded as "abolitionism," declared to be hostility to the public welfare, and punished with proscription, personal violence, expulsion, and frequently death. Of the lynchings, the mobs, and the murders, it would be impossible, except in a very extended work, to note the frequent and atrocious details. The present chapters can only touch upon the more salient movements of the civil war in Kansas, which happily were not sanguinary; if, however, the individual and more isolated cases of bloodshed could be described, they would show a startling aggregate of barbarity and loss of life for opinion's sake. Some of these revolting crimes, though comparatively few in number, were committed, generally in a spirit of lawless retaliation, by free-State men.

Among other instrumentalities for executing the bogus laws, the bogus legislature had appointed one Samuel J. Jones sheriff of Douglas county, Kansas Territory, although that individual was at the time of his appoint-

ment, and long afterwards, United States postmaster of the town of Westport, Missouri. Why this Missouri citizen and Federal official should in addition be clothed with a foreign territorial shrievalty of a county lying forty or fifty miles from his home is a mystery which was never explained outside a Missouri Blue Lodge. A partial solution is afforded in the fact that Jones was apparently a born persecutor, overflowing with zeal for slavery. Whether chosen by accident or design, his fitness to become the active agent of the conspiracy gives his name and acts a lamentable prominence in Kansas history.

A few days after the "law-and-order" meeting in Leavenworth, there occurred a murder in a small settlement thirteen miles west of the town of Lawrence. The murderer, a pro-slavery man, first fled to Missouri, but returned to Shawnee Mission and sought the official protection of Sheriff Jones; no warrant, no examination, no commitment followed, and the criminal remained at large. Out of this incident, the officious sheriff managed most ingeniously to create an embroilment with the town of Lawrence. Buckley, who was alleged to have been accessory to the crime, obtained a peace-warrant against Branson, a neighbor of the victim. With this peace-warrant in his pocket, but without showing or reading it to his prisoner, Sheriff Jones and a posse of twenty-five Border Ruffians proceeded to Branson's house at midnight and arrested him. Alarm being given, Branson's free-State neighbors, already exasperated at the murder, rose under the sudden instinct of self-protection and rescued Branson from the sheriff and his posse that same night, though without other violence than harsh words.*

Burning with the thirst of personal revenge, Sheriff Jones now charged upon the town of Lawrence, because that was the stronghold of the free-State men of the territory, the violation of law involved in this rescue, though Lawrence immediately and earnestly disavowed the act. But for Sheriff Jones and his superiors the pretext was all-sufficient. A Border-Ruffian foray against the town was hastily organized. The murder occurred November 21st, the rescue November 26th. November 27th, upon the brief report of Sheriff Jones, demanding a force of three thousand men "to carry out the laws," Governor Shannon issued his order to the two major-generals of the skeleton militia, "to collect together as large a force as you can in your division, and repair without delay to Lecompton, and report yourself to S. J. Jones, sheriff of Douglas county."† The Kansas militia was a myth; but the Bor-

UNITED STATES ARSENAL, LIBERTY. (REDRAWN FROM PHOTOGRAPHS IN POSSESSION OF COLONEL NATHANIEL GRANT.)

der Ruffians, with their backwoods rifles and shot-guns, were a ready resource. To these an urgent appeal for help was made; and the leaders of the conspiracy in prompt obedience placarded the frontier with inflammatory hand-bills, and collected and equipped companies, and hurried them forward to the rendezvous without a moment's delay. The United States Arsenal at Liberty, Missouri, was broken into and stripped of its contents to supply cannon, small arms, and ammunition. In two days after notice a company of fifty Missourians made the first camp on Wakarusa Creek, near Franklin, four miles from Lawrence. In three or four days more an irregular army of fifteen hundred men, claiming to be the sheriff's posse, was within striking distance of the town. Three or four hundred of these were nominal residents of the territory; * all the remainder were citizens of Missouri. They were not only well armed and supplied, but wrought up to the highest pitch of partisan excitement. While the governor's proclamation spoke of serving writs, † the notices of the conspirators sounded the note of the real contest. "Now is the time to show

game, and if we are defeated this time, the territory is lost to the South," said the leaders. ‡ There was no doubt of the earnestness of their purpose. Ex-Vice-President Atchison came in person, leading a battalion of two hundred Platte county riflemen.

News of this proceeding came to the people of Lawrence little by little, and finally, becoming alarmed, they began to improvise means of defense. Two abortive imitations of the Missouri Blue Lodges, set on foot during the summer by the free-State men, provoked by the election invasion in March, furnished them a starting-point for military organization. A committee of safety, hurriedly instituted, sent a call for help from Lawrence to other points in the territory "for the purpose of defending it from threatened invasion by armed men now quartered in its vicinity." Several hundred free-State men promptly responded to the summons. The Free-State Hotel served as barracks. Governor Robinson and Colonel Lane were appointed to command. Four or five small redoubts, connected by rifle-pits, were hastily thrown up; and by a clever

‡ Phillips, p. 168.

artifice they succeeded in bringing a twelve-pound brass howitzer from its storage at Kansas City. Meantime the committee of safety, earnestly denying any wrongful act or purpose, sent an urgent appeal for protection to the commander of the United States forces at Fort Leavenworth, another to Congress, and a third to President Pierce.

Amid all this warlike preparation to keep the peace, no very strict military discipline

On one point especially the Border Ruffians had a wholesome dread. Yankee ingenuity had invented a new kind of breech-loading gun called "Sharpe's rifle." It was, in fact, the best weapon of its day. The free-State volunteers had some months before obtained a partial supply of them from the East, and their range, rapidity, and effectiveness had been not only duly set forth but highly exaggerated by many marvelous stories throughout the ter-

JAMES H. LANE (BY PERMISSION OF THE STROWBRIDGE LITHOGRAPHING CO.)

could be immediately enforced. The people of Lawrence without any great difficulty obtained daily information concerning the hostile camps. They, on the other hand, professing no purpose but that of defense and self-protection, were obliged to permit free and constant ingress to their beleaguered town. Sheriff Jones made several visits unmolested on their part, and without any display of writs or demand for the surrender of alleged offenders on his own. One of the rescuers even accosted him, conversed with him, and invited him to dinner. These free visits, however, had the good effect to restrain imprudence and impulsiveness on both sides. They could see with their own eyes that a conflict meant serious results. With the advantage of its defensive position, Lawrence was as strong as the sheriff's mob.

ritory and along the border. The Missouri backwoodsmen manifested an almost incredible interest in this wonderful gun. They might be deaf to the "equalities" proclaimed in the Declaration of Independence or blind to the moral sin of slavery, but they comprehended a rifle which could be fired ten times a minute and kill a man at a thousand yards.

The arrivals from Missouri finally slackened and ceased. The irregular Border-Ruffian squads were hastily incorporated into the skeleton "Kansas militia." The "posse" became some two thousand strong, and the defenders of Lawrence perhaps one thousand.

Meanwhile a sober second thought had come to Governor Shannon. To retrieve somewhat the precipitancy of his militia orders and proclamations, he wrote to Sheriff Jones, De-

cember 2d, to make no arrests or movements unless by his direction. The firm defensive attitude of the people of Lawrence had produced its effect. The leaders of the conspiracy became distrustful of their power to crush the town. One of his militia generals suggested that the governor should require the "outlaws at Lawrence and elsewhere" to surrender the Sharpe's rifles; * another wrote asking him to call out the Government troops at Fort Leavenworth. The governor, on his part, becoming doubtful of the legality of employing Missouri militia to enforce Kansas laws, was also eager to secure the help of Federal troops. Sheriff Jones began to grow importunate. In the Missouri camp while the leaders became alarmed the men grew insubordinate. "I have reason to believe," wrote one of their prominent men, "that before to-morrow morning the black flag will be hoisted, when nine out of ten will rally around it, and march without orders upon Lawrence. The forces of the Leecompton camp fully understand the plot and will fight under the same banner." †

After careful deliberation Colonel Sumner, commanding the United States troops at Fort Leavenworth, declined to interfere without explicit orders from the War Department. ‡ These failing to arrive in time, the governor was obliged to face his own dilemma. He hastened to Lawrence, which now invoked his protection. He directed his militia generals to repress disorder and check any attack on the town. Interviews were held with the free-State commanders, and the situation was fully discussed. A compromise was agreed upon, and a formal treaty written out and signed. The affair was pronounced to be a "misunderstanding"; the Lawrence party disavowed the Branson rescue, denied any previous, present, or prospective organization for resistance, and under sundry provisos agreed to aid in the execution of "the laws" when called upon by "proper authority." Like all compromises, the agreement was half necessity, half trick. Neither party was willing to yield honestly or ready to fight manfully. The free-State men shrank from forcible resistance to even bogus laws. The Missouri cabal, on the other hand, having three of their best men constantly at the governor's side, were compelled to recognize their lack of justification. They did not dare to ignore upon what a ridiculously shadowy pre-

COLONEL E. V. SUMNER.

text the Branson peace-warrant had grown into an army of two thousand men, and how, under manipulation of Sheriff Jones, a questionable affidavit of a pro-slavery criminal had been expanded into the *casus belli* of a free-State town. They consented to a compromise "to cover a retreat."

When Governor Shannon announced that the difficulties were settled, the people of Lawrence were suspicious of their leaders, and John Brown manifested his readiness to head a revolt. But his attempted speech was hushed down, and the assurance of Robinson and Lane that they had made no dishonorable concession finally quieted their followers. There were similar murmurs in the pro-slavery camps. The governor was denounced as a traitor, and Sheriff Jones declared that "he would have wiped out Lawrence." Atchison, on the contrary, sustained the bargain, explaining that to attack Lawrence under the circumstances would ruin the Democratic cause. "But," he added with a significant oath, "boys, we will fight some time!" Thirteen of the captains in the Wakarusa camp were called together, and the situation was duly explained. The treaty was accepted, though the governor confessed "there was a silent dissatisfaction" § at the result. He ordered the forces to disband; prisoners were liberated, and with the opportune aid of a furious rain-storm the Border-Ruffian army gradually melted away. Nevertheless the

"Wakarusa war" left one bitter sting to rankle in the hearts of the defenders of Lawrence, a free State man having been killed by a pro-slavery scouting party.

The truce patched up by this Lawrence treaty was of comparatively short duration. The excitement which had reigned in Kansas during the whole summer of 1855, first about the enactments of the bogus legislature, and then in regard to the formation of the Topeka Constitution, was now extended to the Amer-

ican Congress, where it raged for two long months over the election of Speaker Banks. In Kansas during the same period the vote of the free-State men upon the Topeka Constitution and the election for free-State officers under it kept the territory in a ferment. During and after the contest over the speakership at Washington, each State legislature became a forum of Kansas debate. The general public interest in the controversy was shown by discussions carried on by press, pulpit, and in the daily conversation and comment of the people of the Union in every town, hamlet, and neighborhood. No sooner did the spring weather of 1856 permit, than men, money, arms, and supplies were poured into the territory of Kansas from the North. In the Southern States also this propagandism was active, and a number of guerilla leaders with followers recruited in the South, and armed and sustained by Southern contributions and appropriations, found their way to Kansas in response to urgent appeals of the Border chiefs. Buford of Alabama, Titus of Florida, Wilkes of Virginia, Hampton of Kentucky, Treadwell of South Carolina, and others, brought not only enthusiastic leadership, but substantial assistance. Both the factions which had come so near to actual battle in the "Wakarusa war," though nominally disbanded, in reality preserved and continued their military organization,—the free-State men through apprehension of danger, the Border Ruffians because of their purpose to crush out opposition. Strengthened on both sides with men, money, arms, and supplies, the contest was gradually resumed with the opening spring.

A FREE STATE BATTERY (1856). (REDRAWN FROM A DAGUERRIOTYPE IN POSSESSION OF THE KANSAS HISTORICAL SOCIETY.)

The vague and double-meaning phrases of the Lawrence agreement furnished the earliest causes of a renewal of the quarrel. "Did you not pledge yourselves to assist me as sheriff in the arrest of any person against whom I might have a writ?" asked Sheriff Jones of Robinson and Lane in a curt note. "We may have said that we would assist any proper official in the service of any legal process," they replied, standing upon their interpretation.* This was, of course, the original controversy — slavery burning to enforce her usurpation, freedom determined to defend her birthright. Sheriff Jones had his pockets always full of writs issued in the spirit of persecution, though often baffled by the sharp wits and ready resources of the free-State people, and sometimes defied outright. Little by little, however, the latter became hemmed and bound in the meshes of the various devices and proceedings which the territorial officials evolved by hook and crook out of the bogus laws. President Pierce, in his special message of January 24th, declared what had been done by the Topeka movement to be "of a revolutionary character" which would "become treasonable insurrection if it reach the length of organized resistance."

Following this came his proclamation of February 11th, leveled against "combinations formed to resist the execution of the territorial laws." Early in May Chief-Justice Lecompte held a term of his court, during which he delivered to the grand jury his famous instructions on constructive treason. Indictments were found, writs issued, and the principal free-State leaders arrested or forced to flee from the territory. Governor Robinson was

arrested without warrant on the Missouri River, and brought back to be held in military custody till September. Lane went East and recruited additional help for the contest. Meanwhile

(FROM A DAGUERRETYPE IN POSSESSION OF MRS. ROBINSON.)

* Governor Robinson being on his way East, the steamboat on which he was traveling stopped at Lexington, Missouri. An unauthorized mob induced the governor, with that gentle persuasiveness in which the Border Ruffians had become adepts, to leave the boat, detaining him at Lexington on the accusation that he was fleeing from an indictment. In a few days an officer came with a requisition from Governor Shannon, and took the prisoner by land to Westport, and afterwards from there to Kansas City and Leavenworth. Here he was placed in the custody of Captain Martin, of the Kickapoo Rangers, who proved a kind jailer, and

materially assisted in protecting him from the dangerous intentions of the mob which at that time held Leavenworth under a reign of terror.

Mrs. Robinson, who has kindly sent us a sketch of the incident, writes: "On the night of the 28th [of May] for greater security General Richardson of the militia slept in the same bed with the prisoner, while Judge Lecompte and Marshal Donaldson slept just outside of the door of the prisoner's room. Captain Martin said, 'I shall give you a pistol to help protect yourself with if worse comes to worst!' In the early morning of the next day, May 29th, a company of

Sheriff Jones, sitting in his tent at night, in the town of Lawrence, had been wounded by a rifle or pistol ball, in the attempt of some unknown person to assassinate him. The people of Lawrence denounced the deed; but the sheriff hoarded up the score for future revenge. One additional incident served to precipitate the crisis. The House of Representatives at Washington, presided over by Speaker Banks, and under control of the opposition, sent an investigating committee to Kansas, consisting of Wm. A. Howard of Michigan, John Sherman of Ohio, and Mordecai Oliver of Missouri, which, by the examination of numerous witnesses, was probing the Border-Ruffian invasions, the illegality of the bogus legislature, and the enormity of the bogus laws to the very bottom. Ex-Governor Reeder was in attendance on this committee, supplying data, pointing out from personal knowledge sources of information, cross-examining witnesses to elicit the hidden truth. To embarrass this damaging exposure, Judge Lecompte issued a writ against the ex-governor on a frivolous charge of contempt. Claiming but not receiving exemption from the committee, Reeder on his personal responsibility refused to permit the deputy marshal to arrest him. The incident was not violent, nor even dramatic. No posse was summoned, no further effort made, and Reeder, fearing personal violence, soon fled in disguise. But the affair was magnified as a crowning proof that the free-State men were insurrectionists and outlaws.

It must be noted in passing that by this time the territory had by insensible degrees drifted into the condition of civil war. Both parties were zealous, vigilant, and denunciatory. In nearly every settlement suspicion led to apprehension, apprehension to combination for defense, combination to some form of oppression or insult, and so on by easy transitions to arrest and concealment, attack and reprisal, expulsion, theft, house-burning, capture, murder, and massacre. From these, again, sprang barricaded and fortified dwellings, camps and scouting parties, finally culminating in roving guerilla bands, half partisan, half predatory. Their distinctive characters, however, display one broad and unfailing difference. The free-State men clung to their prairie towns and prairie ravines with all the obstinacy and courage of true defenders of their homes and firesides. The pro-slavery

dragoons with one empty saddle came down from the fort, and while the pro-slavery men still slept, the prisoner and his escort were on their way across the prairies to Lecompton in the charge of officers of the United States Army. The governor and other prisoners were kept on the prairie near Lecompton until the 10th of September, 1856, when all were released."—THE AUTHORS.

parties, unmistakable aliens and invaders, always came from or retired across the Missouri line. Organized and sustained in the beginning by voluntary contributions from that and distant States, they ended by levying forced contributions, by "pressing" horses, food, or arms from any neighborhood they

chanced to visit. Their assumed character changed with their changing opportunities or necessities. They were squads of Kansas militia, companies of "peaceful emigrants," or gangs of irresponsible outlaws, to suit the chance, the whim, or the need of the moment.

Since the unsatisfactory termination of the "Wakarusa war," certain leaders of the conspiracy had never given up their project of punishing the town of Lawrence. A propitious moment for carrying it out seemed now to have arrived. The free-State officers and leaders were, thanks to Judge Lecompte's doctrine of constructive treason, under indict-

It will interest our readers to know that the former editor-in-chief of THE CENTURY, Dr. J. G. Holland, formed a partnership with Dr. Robinson in 1845, and opened with him a hospital in Springfield, Massachusetts. Circumstances, however, soon led to the discontinuance of this enterprise.—EDITOR CENTURY.

ment, arrest, or in flight; the settlers were busy with their spring crops; while the proslavery guerillas, freshly arrived and full of zeal, were eager for service and distinction. The former campaign against the town had failed for want of justification; therefore they now took pains to provide a pretext which would not shame their assumed character as defenders of law and order. In the shooting of Sheriff Jones in Lawrence, and in the refusal of ex-Governor Reeder to allow the deputy-marshal to arrest him, they discovered grave offenses against the territorial and United States laws. Determined also no longer to trust Governor Shannon, lest he might again make peace, United States Marshal Donaldson issued a proclamation on his own responsibility, on May 11th, 1856, commanding "law-abiding citizens of the territory" "to be and appear at Leocompton, as soon as possible and in numbers sufficient for the execution of the law." * Moving with

all the promptness and celerity of preconcert, ex-Vice-President Atchison, with his Platte County Rifles and two brass cannon, the Kickapoo Rangers from Leavenworth and Weston, Wilkes, Titus, Buford, and all the rest of the free lances in the territory began to concentrate against Lawrence, giving the marshal in a very few days a "posse" of from five hundred to eight hundred men, † armed for the greater part with United States muskets, some stolen from the Liberty arsenal on their former raid, others distributed to them as Kansas militia by the territorial officers. The governor refused to interfere to protect the threatened town, ‡ though urgently appealed to do so by its citizens, who after somewhat stormy and divided councils resolved on a policy of non-resistance.

They next made application to the marshal, who tauntingly replied that he could not rely on their pledges, and must take the liberty to execute his process in his own time and manner. § The help of Colonel Sumner, command-

THE FREE-STATE HOTEL, LAWRENCE, KANSAS. (FROM A PHOTOGRAPH IN POSSESSION OF THE KANSAS HISTORICAL SOCIETY.)

ing the United States troops, was finally invoked, but his instructions only permitted him to act at the call of the governor or marshal.* Private parties who had leased the Free-State Hotel vainly besought the various authorities to prevent the destruction of their property. Ten days were consumed in these negotiations; but the spirit of vengeance refused to yield. When the citizens of Lawrence rose on the 21st of May they beheld their town invested by a formidable military force.

During the forenoon the deputy marshal rode leisurely into the town attended by less than a dozen men, being neither molested nor opposed. He summoned half a dozen citizens to join his posse, who followed, obeyed, and assisted him. He as leisurely continued his pretended search and, to give color to his errand, made two arrests. The Free-State Hotel, a stone building in dimensions fifty by seventy feet, three stories high, and handsomely furnished, previously occupied only for lodging-rooms, on that day for the first time opened its table accommodations to the public, and had provided a free dinner in honor of the occasion. The marshal and his posse, including Sheriff Jones, went among other invited guests and enjoyed the proffered hospitality. As he had promised to protect the hotel, the reassured citizens began to laugh at their own fears. To their sorrow they were soon undeceived. The military force, partly rabble, partly organized, had meanwhile moved into the town. To save his official skirts from stain, the deputy marshal now went through the farce of dismissing his entire posse of citizens and Border Ruffians, at which juncture Sheriff Jones made his appearance, claiming

the "posse" as his own. He planted a company before the hotel, and demanded a surrender of the arms belonging to the free-State military companies. Refusal or resistance being out of the question, half a dozen small cannon were solemnly dug up from their buried concealment and, together with a few Sharpe's rifles, formally delivered. Half an hour later, turning a deaf ear to all remonstrance, he gave the proprietors until five o'clock to remove their families and personal property from the Free-State Hotel. Atchison, who had been haranguing the mob, planted his two guns before the building and trained them upon it. The inmates being removed, at the appointed hour a few cannon-balls were fired through the stone walls. This mode of destruction being slow and undramatic, and an attempt to blow it up with gunpowder having proved equally unsat-

isfactory, the torch was deliberately applied, and the structure given to the flames.† Other squads had during the same time been sent to the several printing-offices, where they broke the presses, scattered the type, and demolished the furniture. The house of Governor Robinson was also robbed and burned. Very soon the mob was beyond all control, and spreading itself over the town engaged in pillage till the darkness of night arrested it. Meanwhile the chiefs sat on their horses and viewed the work of destruction with open delight.

If we would believe the chief actors, this was the "law-and-order party," executing the mandates of justice. Part and parcel of the affair was the pretense that this exploit of prairie buccaneering had been authorized by Judge Lecompte's court, the officials citing in their defense a presentment of his grand jury, declaring the free-State newspapers seditious

BREAKING UP A PRO-SLAVERY CAMP.

publications, and the Free-State Hotel a rebellious fortification, and recommending their *abatement* as nuisances.* The travesty of American government involved in the transaction is too serious for ridicule. In this incident, contrasting the creative and the destructive spirit of the factions, the Emigrant Aid Society of Massachusetts finds its most honorable and triumphant vindication. The whole proceeding was so childish, the miserable plot so transparent, the outrage so gross, as to bring disgust to the better class of Border Ruffians themselves who were witnesses and accessories. The free-State men have recorded the honorable conduct of Colonel Zaddock Jackson of Georgia, and Buford of Alabama, as well as of the prosecuting attorney of the county, each of whom denounced the proceedings on the spot.†

JEFFERSON DAVIS ON REBELLION.

WHILE the town of Lawrence was yet undergoing burning and pillage, Governor Shannon wrote to Colonel Sumner to say that as the marshal and sheriff had finished making their arrests, and he presumed had by that time dismissed the posse, he required

a company of United States troops to be stationed at Lawrence to secure "the safety of the citizens in both persons and property,"‡ asking also a like company for Lecompton and Topeka. The next day the citizens of Lawrence had the opportunity to smother their indignation when they saw the smoldering embers of the Free-State Hotel and the scattered fragments of their printing-presses patrolled and "protected" by the Federal dragoons whose presence they had so vainly implored a few days before.§ It was high time the governor should move. The sack of Lawrence had unchained the demon of civil war in good earnest. The guerilla bands with their booty spread over the country, and the free-State men rose in a spirit of fierce retaliation. Assassinations, house-burnings, expulsions, and skirmishes broke out with frightful speed in all quarters. The sudden shower of lawlessness fell on the just and the unjust; and, forced at last to deal out

equal protection, the governor (June 4th) issued his proclamation directing military organizations to disperse, "without regard to party, names, or distinctions,"* and empowering Colonel Sumner to enforce the order.† That careful and discreet officer, who had from the first counseled this policy, at once proceeded to execute the command with his characteristic energy. He disarmed and dispersed the free-State guerillas,—John Brown's among the earliest,—liberated prisoners, drove the Missourians, including delegate Whitfield and General Coffee of the skeleton militia, back across their State line, and stationed five companies along the border to prevent their return. He was so fortunate as to accomplish all this without bloodshed. "I do not think," he wrote, June 23d, "there is an armed body of either party now in the territory, with the exception perhaps of a few freebooters."‡ The colonel found very soon that he was only too efficient and faithful. "My measures have necessarily borne hard against both parties," wrote Sumner to the War Department, "for both have in many instances been more or less wrong. The Missourians were perfectly satisfied so long as the troops were employed exclusively against the free-State party; but when they found that I would be strictly impartial, that lawless mobs could no longer come from Missouri, and that their interference with the affairs of Kansas was brought to an end, then they immediately raised a hue and cry that they were oppressed by the United States troops."§ The complaint had its usual prompt effect at Washington. By orders dated June 27th the colonel was superseded in his command, and Brigadier-General P. F. Smith was sent to Leavenworth. Known to be pro-slavery in his opinions, great advantages were doubtless expected by the conspiracy from this change. But General Smith was an invalid, and incapable of active service; and so far as the official records show, the army officers and troops in Kansas continued to maintain a just impartiality in their dealings with the vexed political quarrel of the day.

The removal of Governor Shannon a few weeks after Colonel Sumner once more made Secretary Woodson, always a willing instrument of the conspiracy, acting governor. It was under this individual's promptings and proclamation, Shannon being absent from the territory, that Colonel Sumner, before the arrival of the orders superseding him, forcibly

dispersed the free-State legislature on the 4th of July, as narrated. For this act the cynical Secretary of War, Jefferson Davis, was not slow to send the colonel an implied censure,|| perhaps to justify his removal from command; but not a word of reproof went from President or Secretary of State to the acting governor.

It has already been stated that for a considerable length of time after the organization of Kansas Territory the Missouri River was its principal highway of approach from the States. To antislavery men who were unwilling to conceal their sentiments, this had from the very first been a route of difficulty and danger. But now that political strife culminated in civil war, the Missourians established a complete practical blockade of the river against Northern men or Northern goods. Recently, however, railroads had been pushed forward across Iowa, and the Northern emigration to Kansas little by little found a new route through that State and Nebraska.

It was about this time that great consternation was created in pro-slavery circles by the report that Lane had arrived at the Iowa border with a "Northern army," exaggerated into fabulous numbers, and intent upon fighting his way to Kansas. Parties headed by Lane and others and aggregating some hundreds had in fact so arrived, and were more or less provided with arms, though they had no open military organization. While spies and patrols were on the lookout for marching companies and regiments, they, concealing their arms, quietly slipped down in detached parties to Lawrence. Thus reënforced and inspirited, the free-State men took the aggressive, and by several bold movements broke up a number of pro-slavery camps and gatherings. Greatly exaggerated reports of these affairs were promptly sent to the neighboring Missouri counties, and the Border Ruffians rose almost to a man for a third military invasion of Kansas.

Governor Shannon, not yet notified of his removal, reported to General Smith that Lecompton was threatened with an attack. General Smith, becoming himself alarmed, called together all available force for the protection of the territorial capital, and reported the exigency to the War Department. All the hesitation which had hitherto characterized the instructions of Jefferson Davis, the Secretary of War, in the use of troops otherwise than as an officer's posse, instantly vanished.

The whole Kansas militia was placed under the orders of General Smith, and requisitions were issued for two regiments from Illinois and two from Kentucky.

"The position of the insurgents," wrote the Secretary, "as shown by your letter and its inclosures, is that of open rebellion against the laws and constitutional authorities, with such manifestation of a purpose to spread devastation over the land as no longer justifies further hesitation or indulgence. To you, as to every soldier, whose habitual feeling is to protect the citizens of his own country, and only to use his arms against a public enemy, it cannot be otherwise than deeply painful to be brought into conflict with any portion of his fellow-countrymen. But patriotism and humanity alike require that rebellion should be promptly crushed, and the perpetration of the crimes which now disturb the peace and security of the good people of the territory of Kansas should be effectually checked. You will therefore energetically employ all the means within your reach to restore the supremacy of the law, always endeavoring to carry out your present purpose to prevent the unnecessary effusion of blood."*

The cold-blooded Secretary, who could read a description of the sack of Lawrence unmoved, had probably cast his eye upon the Platte county battle-call in the "Weston Argus Extra," which formed one of the general's inclosures.

"So sudden and unexpected has been the attack of the abolitionists that the law-and-order party was unprepared to effectually resist them. To-day the bogus free-State government, we understand, is to assemble at Topeka. The issue is distinctly made up; either the free-State or pro-slavery party is to have Kansas. . . . Citizens of Platte county! the war is upon you, and at your very doors. Arouse yourselves to speedy vengeance and rub out the bloody traitors."†

It was perhaps well that the pro-slavery zeal of General Smith was less ardent than that of Secretary Jefferson Davis, or the American civil war might have begun in Lawrence instead of Charleston. Upon a little fuller information and more mature reflection, the general found that he had no need either of the four regiments from Illinois and Kentucky or Border-Ruffian mobs led by skeleton militia generals, neither of which he had asked for. Both the militia generals and the Missourians were too eager even to wait for an official call. "General" Richardson ordered out his whole division on the strength of the "Argus Extra" and neighborhood reports,‡ and the entire border was already in motion when Acting Governor Woodson issued his proclamation § declaring the territory "to be in a state of open insurrection and rebellion." General Smith found it necessary to direct his first orders against the Border-Ruffian invaders themselves.

* Jefferson Davis, Secretary of War, to General Smith, Sept. 3d, 1856. Senate Docs., 3d Sess. 34th Cong. Vol. III., p. 29.

† August 18th, 1856. Senate Docs., 3d Sess. 34th Cong. Vol. III., pp. 76-7.

‡ Richardson to General Smith, August 18th, 1856. Senate Docs., 3d Sess. 34th Cong. Vol. III., p. 75.

"It has been rumored for several days," he wrote to his second in command, "that large numbers of persons from the State of Missouri have entered Kansas, at various points, armed, with the intention of attacking the opposite party and driving them from the territory, the latter being also represented to be in considerable force. If it should come to your knowledge that either side is moving upon the other with the view to attack, it will become your duty to observe their movements and prevent such hostile collisions."||

Lieutenant-Colonel Cooke, upon whom this active field work devolved, because of the general's ill health, concentrated his little command between Lawrence and Lecompton, where he could to some extent exert a salutary check upon the main bodies of both parties, and where he soon had occasion to send a remonstrance to the acting governor that his "militia" was ransacking and burning houses.¶ To the acting governor's mind, such a remonstrance was not a proper way to suppress rebellion. He therefore sent Colonel Cooke a requisition to invest the town of Topeka, disarm the insurrectionists, hold them as prisoners, level their fortifications, and intercept aggressive invaders on "Lane's trail";** all of which demands the officer prudently and politely declined, replying that he was there to assist in serving judicial process, and not to make war on the town of Topeka.††

If, as had been alleged, General Smith was at first inclined to regard the pro-slavery side with favor, their arrogance and excesses soon removed his prejudices, and he wrote an unsparing report of the situation to the War Department.

"In explanation of the position of affairs, lately and now, I may remark that there are more than two opposing parties in the territory. The citizens of the territory who formed the majority in the organization of the territorial government, and in the elections for its legislature and inferior officers, form one party. The persons who organized a State government, and attempted to put it in operation against the authority of that established by Congress, form another. A party, at the head of which is a former Senator from Missouri, and which is composed in a great part of citizens from that State, who have come into this territory armed, under the excitement produced by reports exaggerated in all cases, and in many absolutely false, form the third. There is a fourth, composed of idle men congregated from various parts, who assume to arrest, punish, exile, and even kill all those whom they assume to be bad citizens; that is, those who will not join them or contribute to their maintenance. Every one of these has in its own peculiar way (except some few of the first party) thrown aside all regard to law, and even honesty, and the territory under their sway is ravaged from one end to the other. . . . Until the day before yesterday I was deficient in force

§ August 25th, 1856. Ibid., p. 80.

†† Cooke to Woodson, Sept. 2d, 1856. Ibid., p. 91.

to operate against all these at once; and the acting governor of the territory did not seem to me to take a right view of affairs. If Mr. Atchison and his party had had the direction of affairs, they could not have ordered them more to suit his purpose."*

All such truth and exposure of the conspiracy, however, was unpalatable at Washington; and Secretary Jefferson Davis, while approving the conduct of Colonel Cooke and expressing confidence in the general, nevertheless curtly indorsed upon his report:

"The only distinction of parties which in a military point of view it is necessary to note is that which distinguishes those who respect and maintain the laws and organized government from those who combine for revolutionary resistance to the constitutional authorities and laws of the land. The armed combination of the latter class come within the denunciation of the President's proclamation and are proper subjects upon which to employ the military force."†

Such was the state of affairs when the third governor of Kansas, newly appointed by President Pierce, arrived in the territory. The Kansas pro-slavery cabal had upon the dismissal of Shannon fondly hoped that one of their own clique, either Secretary Woodson or Surveyor General John Calhoun, would be made executive, and had set on foot active efforts in that direction. In principle and purpose they enjoyed the abundant sympathy of the Pierce administration; but as the presidential election of 1856 was at hand, the success of the Democratic party could not at the moment be endangered by so open and defiant an act of partisanship. It was still essential to placate the wounded antislavery sensibilities of Pennsylvania and other Northern States, and to this end John W. Geary of the Keystone State was nominated by the President and unanimously confirmed by the Senate. He was a man of character and decision, had gone to the Mexican War as a volunteer captain, and had been made a colonel and intrusted with an important command for merit. Afterwards he had served as postmaster, as alcalde, and as mayor of the city of San Francisco in the turbulent gold excitements of 1848-9, and was again made a funding commissioner by the California legislature.‡ Both by nature and experience, therefore, he seemed well fitted to subdue the civil commotions of Kansas.

But the pro-slavery leaders of the territory were very far from relishing or desiring qualifications of this character. In one of their appeals calling upon the Missourians for "assistance in men, provisions, and munitions, that we may drive out the 'Army of the North,'"§

they had given the President and the public a piece of their mind about this appointment.

"We have asked the appointment of a successor," said they, "who was acquainted with our condition," with "the capacity to appreciate and the boldness and integrity requisite faithfully to discharge his duty regardless of the possible effect it might have upon the election of some petty politician in a distant State. In his stead we have one appointed who is ignorant of our condition, a stranger to our people; who, we have too much cause to fear, will, if no worse, prove no more efficient to protect us than his predecessors. . . . We cannot await the convenience in coming of our newly appointed governor. We cannot hazard a second edition of imbecility or corruption!"¶

Animated by such a spirit, they now bent all their energies upon concentrating a sufficient force in Kansas to crush the free-State men before the new governor could interfere. Acting Governor Woodson had by proclamation declared the territory in a state of "open insurrection and rebellion,"|| and the officers of the skeleton militia were hurriedly enrolling the Missourians, giving them arms, and planting them in convenient camps for a final and decisive campaign.

It was on September 9th, 1856, that Governor Geary and his party landed at Leavenworth. Even on his approach he had already been compelled to note and verify the evidences of civil war. He had met, fleeing from the territory, Governor Shannon, who drew for him a direful picture of the official inheritance to which he had come.¶ While this interview took place, during the landing of the boat at Glasgow, a company of sixty Missouri Border Ruffians was embarking, with wagons, arms, and cannon, and with the open declaration that they were bound for Kansas to hunt and kill "abolitionists."** Similar belligerent preparations were in progress at all the river towns they touched. At Kansas City the vigilance committee of the blockade boarded and searched the boat for concealed "abolitionists." Finally arrived at Leavenworth, the governor saw a repetition of the same scenes,—parades and military control in the streets, fugitives within the inclosure of the fort, and hundreds of minor evidences of lawlessness and a reign of terror.

Governor Geary went at once to the fort, where he spent the day in consultation with General Smith. That same evening he wrote to Secretary of State Marcy a report of the day's impressions which was anything but reassuring—Leavenworth in the hands of armed men committing outrages under the

shadow of authority; theft and murder in the streets and on the highways; farms plundered and deserted; agitation, excitement, and utter insecurity everywhere, and the number of troops insufficient to compel peace and order. All this was not the worst, however. Deep in the background stood the sinister apparition of the Atchison cabal.

"I find," wrote he, "that I have not simply to contend against bands of armed ruffians and brigands whose sole aim and end is assassination and robbery — infatuated adherents and advocates of conflicting political sentiments and local institutions — and evil-disposed persons actuated by a desire to obtain elevated positions; but worst of all, against the influence of men who have been placed in authority and have employed all the destructive agents around them to promote their own personal interests at the sacrifice of every just, honorable, and lawful consideration. . . . Such is the condition of Kansas faintly pictured. . . . In making the foregoing statements I have endeavored to give the truth and nothing but the truth. I deem it important that you should be apprised of the actual state of the case; and whatever may be the effect of such revelations, they will be given from time to time without extenuation."*

Discouraging as he found his new task of administration, Governor Geary grappled with it in a spirit of justice and decision. The day following his interview with General Smith found him at Lecompton, the nominal capital of the territory, where the other territorial officials, Woodson, Calhoun, Donaldson, Sheriff Jones, Lecompte, Cato, and others, constituted the ever-vigilant working force of the Atchison cabal, precisely as had been so truthfully represented to him by General Smith, and as he had so graphically described in his yesterday's letter to Marcy. Paying little heed to their profusely offered advice, he adhered to his determination to judge for himself, and at once issued an inaugural address, declaring that in his official action he would do justice at all hazards, that he desired to know no party and no section, and imploring the people to bury their past strifes, and devote themselves to peace, industry, and the material development of the territory.† As an evidence of his earnestness he simultaneously issued two proclamations,‡ one disbanding the volunteer or Missouri militia lately called into service by Acting Governor Woodson, and the other commanding the immediate enrollment of the true citizen militia of Kansas Territory, this step being taken by the advice of General Smith.§

He soon found that he could not govern

Kansas with paper proclamations alone. His sudden arrival at this particular juncture was evidently an unexpected *contretemps*. While he was preaching and printing his sage admonitions about peace and prosperity at Lecompton, and laboring to change the implements of civil war into plowshares and pruning-hooks, the Missouri raid against Lawrence, officially called into the field by Woodson's proclamation, was about to deal out destruction to that town. A thousand Border Ruffians (at least two eye-witnesses say twenty-five hundred), led by their recognized Missouri chiefs, were at that moment camped within striking distance of the hated "New Boston." Their published address, which declared that "these traitors, assassins, and robbers must now be punished, must now be taught a lesson they will remember," that "Lane's army and its allies must be expelled from the territory," left no doubt of their errand.

This news reached the governor about midnight of his second day in Lecompton. One of the brigadiers of the skeleton militia was apparently in command, and not yet having caught the cue of the governor's intentions, reported the force for orders, "in the field, ready for duty, and impatient to act."|| At about the same hour he received a message from the agent he had sent to Lawrence to distribute copies of his inaugural, that the people of that town were arming and preparing to receive and repel this contemplated attack of the Missourians. The governor was dumfounded at the information. His promises and policy, upon which the ink was not yet dry, were already in jeopardy. Instead of bringing peace his advent was about to open war.

In this contingency the governor took his measures with true military promptness. He immediately dispatched to the Missouri camp Secretary Woodson with copies of his inaugural, and the adjutant-general of the territory with orders to disband and muster out of service the Missouri volunteers,¶ while he himself, at the head of three hundred dragoons and a light battery, moved rapidly to Lawrence, a distance of twelve miles. Entering that town at sunrise, he found a few hundred men hastily organized for defense in the improvised intrenchments and barricades about the place, ready enough to sell their lives, but vastly more willing to intrust their protection to the governor's authority and the Federal

troops.* They listened to his speech and readily promised to obey his requirements.

Since the Missourians had officially reported themselves to him as subject to his orders, the governor supposed that his injunctions, conveyed to them in writing and print, and borne by the Secretary and the adjutant-general of the territory, would suffice to send them back at once to their own borders, and he returned to Leocompton to take up his thorny duties of administration. But though forewarned by ex-Governor Shannon and by General Smith, the governor did not yet realize the temper and purpose of either the cabal conspirators or the Border-Ruffian rank and file. He had just dispatched a military force in another direction to intercept and disarm a raid about to be made by a detachment of Lane's men, when news came to him that the Missourians were still moving upon Lawrence in increased force, that his officers had not yet delivered their orders, and that skirmishing had begun between the outposts.

Menaced thus with dishonor on one side and contempt on the other, he gathered all his available Federal troops, and hurrying forward posted them between Lawrence and the invaders. Then he went to the Missouri camp, where the true condition of affairs began to dawn upon him. All the Border-Ruffian chiefs were there, headed by Atchison in person, who was evidently the controlling force, though a member of the legislature of the State of Missouri, named Reid, exercised nominal command.† He found his orders unheeded and on every hand mutterings of impatience and threats of defiance. These invading aliens had not the least disposition

JOHN W. GEARY (1866)
(FROM A PHOTOGRAPH BY DRAPER & HUSTED.)

to receive commands as Kansas militia; they invoked that name only as a cloak to shield them from the legal penalties due their real character as organized banditti.

The governor called the chiefs together and made them an earnest harangue. He explained to them his conciliatory policy, read his instructions from Washington, affirmed his determination to keep peace, and appealed personally to Atchison to aid him in enforcing law and preserving order. That wily chief, seeing that refusal would put him in the attitude of a law-breaker, feigned a ready compliance, and he and Reid, his factotum commander, made eloquent speeches "calculated to produce submission to the legal demands made upon them."‡ Some of the lesser

captains, however, were mutinous, and treated the governor to choice bits of Border-Ruffian rhetoric. Law and violence vibrated in uncertain balance, when Colonel Cooke, commanding the Federal troops, took the floor and cut the knot of discussion in a summary way. "I felt called upon to say some words myself," he writes naively, "appealing to these militia officers as an old resident of Kansas and friend to the Missourians to submit to the patriotic demand that they should retire,

HOUSE OCCUPIED BY GOVERNOR GEARY

assuring them of my perfect confidence in the inflexible justice of the governor, and that it would become my painful duty to sustain him at the cannon's mouth."* This argument was decisive. The valiant border chiefs felt willing enough to lead their awkward squads against the slight barricades of Lawrence, but quailed at the unlooked-for prospect of encountering the carbines and sabers of half a regiment of regular dragoons and the grape-shot of a well-drilled light battery. They accepted the inevitable; and swallowing their rage and still nursing their revenge, they consented perforce to retire and be "honorably" mustered out. But for this narrow contingency Lawrence would have been sacked by

of a "muster out," rather than the fine, imprisonment, or halter which the full execution of their design would render them liable to, another detachment of Federal dragoons was enforcing the bogus laws upon a company of free-State men who had just had a skirmish with another detachment of this same invading army of Border Ruffians, at a place called Hickory Point. The encounter itself had all the usual characteristics of the dozens of similar affairs which occurred during this prolonged period of border warfare—a neighborhood feud; neighborhood violence; the appearance of organized bands for retaliation; the taking of forage, animals, and property; the fortifying of two or three log-houses by a pro-slavery

BATTLE OF HICKORY POINT. (IN POSSESSION OF THE KANSAS HISTORICAL SOCIETY.)

the direct agency of the territorial cabal a second time.

Nothing could more forcibly demonstrate the unequal character of the contest between the slave-State and the free-State men in Kansas, even in these manœuvres and conflicts of civil war, than the companion exploit to this third Lawrence raid. The day before Governor Geary, seconded by the "cannon" argument of Colonel Cooke, was convincing the reluctant Missourians that it was better to accept, as a reward for their unfinished expedition, the pay, rations, and honorable discharge

company then on its way to join in the Lawrence attack, and finally the appearance of a more numerous free-State party to dislodge them. The besieging column, some three hundred and fifty in number, had brought up a brass four-pounder, lately captured from the pro-slavery men, and with this and their rifles kept up a long-range fire for about six hours, when the garrison of Border Ruffians capitulated on condition of being allowed "honorably" to evacuate their stronghold and retire. The casualties were one man killed and several wounded.†

* Cooke to Porter, Sept. 16th, 1856. Senate Docs., 3d Sess. 34th Cong. Vol. III., p. 122.

† Examination, Senate Docs., 3d Sess. 34th Cong. Vol. II., pp. 156-169.

The rejoicing of the free-State men over this not too brilliant victory was short-lived. Returning home in separate squads, they were successively intercepted by the Federal dragoons acting as a posse to the Deputy United States Marshal,* who arrested them on civil writs obtained in haste by an active member of the territorial cabal, and to the number of eighty-nine† were taken prisoners to LeCompton. So far the affair had been of such frequent occurrence as to have become commonplace—a frontier “free fight,” as they themselves described and regarded it. But now it took on a truly remarkable aspect. Sterling G. Cato, one of the pro-slavery territorial judges, had been found by Governor Geary in the Missouri camp drilling and doing duty as a soldier,‡ ready and doubtless more than willing to take part in the projected sack of Lawrence. This Federal judge, as open a law-breaker as these Hickory Point prisoners (the two affairs really forming part of one and the same enterprise), now seated himself on his judicial bench and committed the whole party for trial on charge of murder in the first degree;§ and at the October term of his court proceeded to try and condemn to penalties prescribed by the bogus laws some eighteen or twenty of these prisoners, for offenses in which in equity and good morals

IN LECOMPTON PRISON. (IN POSSESSION OF THE KANSAS HISTORICAL SOCIETY.)

FREE-STATE PRISONERS ON THEIR WAY TO LECOMPTON.

he was personally *particeps criminis* — some of the convicts being held in confinement until the following March, when they were pardoned by the governor.* *Inter arma silent leges*, say the publicists; but in this particular instance the license of guerilla war, the fraudulent statutes of the territory, and the laws of Congress were combined and perverted with a satanic ingenuity in furtherance of this wretched conspiracy.

The vigorous proceedings of Governor Geary, the forced retirement of the Missourians on the one hand, and the arrest and conviction of the free-State partisans on the other, had the effect to bring the guerilla war to an abrupt termination. The retribution had fallen very unequally upon the two parties to the conflict,† but this was due to the legal traps and pitfalls prepared with such artful design by the Atchison conspiracy, and not to the personal indifference or ill-will of the governor. He strove sincerely to restore impartial administration; he completed the disbandment of the territorial militia, reënlisting into the Federal service one pro-slavery and one free-State company for police duty. By the end of September he was enabled to write to Washington that “peace now reigns in Kansas.” Encouraged by this success in allaying guerilla strife, he next endeavored to break up the existing political persecution and intrigues.

It was not long, however, before Governor Geary became conscious, to his great surprise and mortification, that he had been nominated and sent to Kansas as a partisan manoeuvre, and not to institute administrative reforms; that his instructions, written during the presidential campaign, to tranquillize Kansas by

his “energy, impartiality, and discretion,”‡ really meant that after Mr. Buchanan was elected he should satisfy the Atchison cabal.

In less than six months after he had come to the territory, clothed with the executive authority, speaking the President’s voice, and representing the unlimited military power of the republic, he, the third Democratic governor of Kansas, was, like his predecessors, in secret and ignoble flight from the province he had so trustfully come to rule, contemned and execrated by his party associates, abandoned and disgraced by the Administration which had appointed him, and without protection to guard him from the assault of highwayman or assassin. Humiliating as was this local conspiracy to plant servitude in Kansas, a more aggressive political movement to nationalize slavery in all the Union was about to eclipse it.

THE CONVENTIONS OF 1856.

IN the State of Illinois, the spring of the year 1856 saw an almost spontaneous impulse toward the formation of a new party. As already described, it was a transition period in politics. The disorganization of the Whig party was materially increased and hastened by the failure, two years before, to make Lincoln a Senator. On the other hand, the election of Trumbull served quite as effectively to consolidate the Democratic rebellion against Douglas in his blind determination to make the support of his Nebraska bill a test of party orthodoxy. Many of the Northern counties formed “Republican” organizations in the two previous years; but the name was entirely local, while the opposition, not yet united, but fighting in factions against the Nebraska bill, only

* Gihon, pp. 142-3. Geary, Executive Minutes, Senate Docs., 1st Sess. 35th Cong. Vol. VI., p. 195.

† The Kansas territorial legislature, in the year 1859, by which time local passion had greatly subsided, by law empowered a non-partisan board of three commissioners to collect sworn testimony concerning the ravages of the civil war in Kansas, with a view of obtaining indemnity from the General Government for the individual sufferers. These commissioners, after a careful examination, made an official report, from which may be gleaned an interesting summary in numbers and values of the harvest of crime and destruction which the Kansas contest produced, and which report can be relied upon, since eye-witnesses and participants of both parties freely contributed their testimony at the invitation of the commissioners.

The commissioners fixed the period of the war as beginning about November 1st, 1855, and continuing until about December 1st, 1856. They estimated that the entire loss and destruction of property, including the cost of fitting out the various expeditions, amounted to an aggregate of not less than \$2,000,000. Fully one-half of this loss, they thought, was directly sustained by actual settlers of Kansas. They received petitions and took testimony in 463 cases. They reported 417 cases as

‡ Marcy to Geary, August 26th, 1856. Gihon, p. 272.

entitled to indemnity. The detailed figures and values of property destroyed are presented as follows:

“Amount of crops destroyed, \$37,349.61; number of buildings burned and destroyed, 78; horses taken or destroyed, 368; cattle taken or destroyed, 533. Amount of property owned by pro-slavery men, \$77,198.99; property owned by free-State men, \$335,779.04; property taken or destroyed by pro-slavery men, \$318,718.63; property taken or destroyed by free-State men, \$94,529.40.”

About the loss of life the commissioners say, “Although not within our province, we may be excused for stating that, from the most reliable information that we have been able to gather, by the secret warfare of the guerilla system, and in well-known encounters, the number of lives sacrificed in Kansas during the period mentioned probably exceeded rather than fell short of two hundred. . . . That the excitement in the Eastern and Southern States, in 1856, was instigated and kept up by garbled and exaggerated accounts of Kansas affairs, published in the Eastern and Southern newspapers, is true, most true; but the half of what was done by either party was never chronicled!” — House Reports, 2d Sess. 36th Cong. Vol. III., Part 1, pp. 90 and 93.

acknowledged political affinity under the general term of the "Anti-Nebraska" party.

In the absence of any existing party machinery, some fifteen editors of anti-Nebraska newspapers met for conference at Decatur on the 22d of February and issued a call for a delegate State convention of the "Anti-Nebraska party," to meet at Bloomington on the 29th of May. Prominent leaders, as a rule, hesitated to commit themselves by their presence at Decatur. Not so with Mr. Lincoln. He could not attend the deliberations as an editor; but he doubtless lent his suggestion and advice, for we find him among the distinguished guests and speakers at the banquet which followed the business session, and toasts to his candidacy as "the next United States Senator" show that his leadership had suffered no abatement. The assembled editors purposely set the Bloomington convention for a somewhat late day in the campaign, and before the time arrived, the political situation in the State was already much more clearly defined.

One factor which greatly baffled the calculations and forecast of politicians was the existence of the Know-Nothing or American party. It was apparent to all that this order or affiliation had during the past two years spread into Illinois, as into other States. But as its machinery and action were secret, and as no general election had occurred since 1854 to exhibit its numerical strength, its possible scope and influence could only be vaguely estimated. Still it was clearly present as a positive force. Its national council had in February at Philadelphia nominated Fillmore and Donelson as a presidential ticket; but the preponderating Southern membership forced an indorsement of the Kansas-Nebraska act into its platform, which destroyed the unity and power of the party, driving the Northern delegates to a bolt. Nevertheless many Northern voters, indifferent to the slavery issue, still sought to maintain its organization; and thus in Illinois the State Council met early in May, ratified the nomination of Fillmore for President, and nominated candidates for governor and other State offices.*

The Democratic party, or rather so much of that party as did not openly repudiate the policy and principle of the Kansas-Nebraska act, made early preparations for a vigorous campaign. The great loss in prestige and numbers he had already sustained admonished Douglas that his political fortunes hung in a doubtful balance. But he was a bold and aggressive leader, to whom controversy and party warfare were rather an inspiration than a discouragement. Under his guidance, the Democratic State con-

vention nominated for governor of Illinois William A. Richardson, late a member of the House of Representatives, in which body as chairman of the Committee on Territories he had been the leader to whom the success of the Nebraska bill was specially intrusted, and where his somewhat unscrupulous parliamentary management had contributed materially to the final passage of that measure.

Thus the attitude of opposing factions and the unorganized unfolding of public opinion, rather than any mere promptings or combinations of leaders, developed the cause of the anti-Nebraska men of Illinois. Out of this condition sprang directly one important element of future success. Richardson's candidacy, long foreshadowed, was seen to require an opposing nominee of unusual popularity. He was found in the person of Colonel William H. Bissell, late a Democratic representative in Congress, where he had denounced disunion in 1850, and opposed the Nebraska bill in 1854. He had led a regiment to the Mexican war, and fought gallantly at the battle of Buena Vista. His military laurels easily carried him into Congress; but the exposures of the Mexican campaign also burdened him with a disease which paralyzed his lower limbs, and compelled retirement from active politics after his second term. He was now, however, once more recovering; and having already exhibited civic talents of a high order, the popular voice made light of his physical infirmity, and his friends declared their readiness to match the brains of Bissell against the legs of his opponents.

One piece of his history rendered him specially acceptable to young and spirited Western voters. His service in Congress began amid exciting debates over the Compromise measures of 1850, when the Southern fire-eaters were already rampant and reckless. Seddon of Virginia, in his eagerness to depreciate the North and glorify the South, affirmed in a speech that at the battle of Buena Vista, "at that most critical juncture when all seemed lost save honor," amid the discomfiture and rout of "the brave but unfortunate troops of the North through a mistaken order," "the noble regiment of Mississippians" had snatched victory from the jaws of death.† Replying some days later to Seddon's innuendo, Bissell, competent by his presence on the battlefield to bear witness, retorted that when the 2d Indiana gave way, it was McKee's 2d Kentucky, Hardin's 1st Illinois, and Bissell's 2d Illinois which had retrieved the fortunes of the hour, and that the vaunted Mississippi regiment was not within a mile and a half of the scene of action. Properly this was an issue of veracity between Seddon and Bissell, of

* "History of Illinois," Davidson and Stuvé, p. 648.

† January 23d, 1850; "Globe," app. 78.

easy solution. But Jefferson Davis, who commanded the Mississippi regiment in question, began an interchange of notes with Bissell which from the first smelt of gunpowder. Were his reported remarks correct? asked Davis in substance. Bissell answered, repeating the language of his speech and defining the spot and the time to which it applied, adding, "I deem it due, in justice alike to myself and the Mississippi regiment, to say that I made no charge against that regiment." Davis persisting, then asked, in substance, whether he meant to deny General Lane's official report that "the regiment of Mississippians came to the rescue at the proper time to save the fortunes of the day." Bissell rejoined, "My remarks had reference to a different time and place from those referred to by General Lane."

At this point both parties might with great propriety have ended the correspondence. Sufficient inquiry had been met by generous explanation. But Davis, apparently determined to push Bissell to the wall, now sent his challenge. This time, however, he met his match in courage. Bissell named an officer of the army as his second, instructing him to suggest as weapons "muskets, loaded with ball and buckshot." The terms of combat do not appear to have been formally proposed between the friends who met to arrange matters, but they were evidently understood; for the affair was hushed up, with the simple addition to Bissell's first reply that he was willing to award the Mississippi regiment "the credit due to their gallant and distinguished services in that battle."

The Bloomington convention came together according to call on the 29th of May. By this time the active and observant politicians of the State had become convinced that the anti-Nebraska struggle was not a mere temporary and insignificant "abolition" excitement, but a deep and abiding political issue, involving in the fate of slavery the fate of the nation. Minor and past differences were therefore generously postponed or waived in favor of a hearty coalition on the single dominant question. A most notable gathering of the clans was the result. About one-fourth of the counties sent regularly chosen delegations; the rest were volunteers. In spirit and enthusiasm, therefore, it was rather a mass-meeting than a convention; but every man present was in some sort a leader in his own locality. The assemblage was much more representative than similar bodies gathered by the ordinary caucus machinery. It was an earnest and determined council of five or six hundred cool, sagacious, independent thinkers, called together by a great public exigency, led and directed by the first minds of the State.

Not only did it show a brilliant array of eminent names, but a remarkable contrast of former antagonisms: Whigs, Democrats, Free-soilers, Know-nothings, Abolitionists; Judd, Yates, Peck, Swett, Trumbull, Davis, Lovejoy, Browning, Coddington, Williams, and many more. Chief among these, as adviser and actor, was Abraham Lincoln.

Rarely has a deliberative body met under circumstances more exciting than did this one. The Congressional debates at Washington and the civil war in Kansas were each at a culmination of passion and incident. Within ten days Sumner had been struck down in the Senate, and the town of Lawrence sacked by the guerilla posse of Atchison and Sheriff Jones. Ex-Governor Reeder, of that suffering territory, addressed the citizens of Bloomington and the earliest-arriving delegates on the evening of the 28th, bringing the very atmosphere of the Kansas conflict into the convention itself.

The convention met and conducted its work with earnestness and dignity. Bissell, already designated by unmistakable popular indications, was nominated for governor by acclamation. The candidate for lieutenant-governor was named in like manner. So little did the convention think or care about the mere distribution of political honors on the one hand, and so much, on the other, did it regard and provide for the success of the cause, that it did not even ballot for the remaining candidates on the State ticket, but deputed to a committee the task of selecting and arranging them, and adopted its report as a whole and by acclamation. The more difficult task of drafting a platform was performed by another committee, with such prudence that it too received a unanimous acceptance. It boldly adopted the Republican name, formulated the Republican creed, and the convention further appointed delegates to the coming Republican national convention.

There were stirring speeches by eloquent leaders, eagerly listened to and vociferously applauded; but scarcely a man stirred from his seat in the crowded hall until Mr. Lincoln had been heard. Every one felt the fitness of his making the closing argument and exhortation, and right nobly did he honor their demand. A silence full of emotion filled the assembly as for a moment before beginning his tall form stood in commanding attitude on the rostrum, the impressiveness of his theme and the significance of the occasion reflected in his thoughtful and earnest features. The spell of the hour was visibly upon him; and holding his audience in rapt attention, he closed in a brilliant peroration with an appeal to the people to join the Republican standard, to

"Come as the winds come, when forests are rended;
Come as the waves come, when navies are stranded."

The influence was irresistible; the audience rose and acknowledged the speaker's power with cheer upon cheer. Unfortunately the speech was never reported; but its effect lives vividly in the memory of all who heard it, and it crowned his right to popular leadership in his own State, which thereafter was never disputed.

The organization of the Republican party for the nation at large proceeded very much in the same manner as that for the State of Illinois. Pursuant to separate preliminary correspondence and calls from State committees, a general meeting of prominent Republicans or anti-Nebraska politicians from all parts of the North, and even from a few border slave States, came together at Pittsburgh on Washington's birthday, February 22d. Ohio, New York, and Pennsylvania sent the largest contingents; but around this great central nucleus were gathered small but earnest delegations, aggregating between three and four hundred zealous leaders, representing twenty-eight States and territories. It was merely an informal mass convention; but many of the delegates were men of national character, each of whose names was itself a sufficient credential. Above all, the members caught the inspiration of wisdom from their opportunity; they were cautious, moderate, conciliatory, and unambitious to act beyond the requirements of the hour. They contented themselves with the usual parliamentary routine; appointed a committee on national organization; issued a call for a delegate convention; and adopted and put forth a stirring address to the country. Their resolutions were brief, and formulated but four demands: the repeal of all laws which allow the introduction of slavery into territories once consecrated to freedom; resistance by constitutional means to slavery in any United States territory; the immediate admission of Kansas as a free State, and the overthrow of the present national Administration.

In response to the official call embodied in the Pittsburgh address, the first national convention of the Republican party met at Philadelphia on the 17th of June, 1856. The character and dignity of the Pittsburgh proceedings assured the new party of immediate prestige and acceptance; with so favorable a sponsorship it sprang full-armed into the political conflict. That conflict which opened the year with the long congressional contest over the speakership, and which found its only solution in the choice of Banks by a plurality vote, had been fed by fierce congressional debates, by presidential messages and proclama-

tions, by national conventions, by the Sumner assault, by the Kansas war; the body politic throbbed with activity and excitement in every fiber. Every free State and several border States and territories were represented in the Philadelphia convention; its regular and irregular delegates counted nearly a full thousand of eager local leaders, full of the zeal of new proselytes.

The party was too young and its prospect of immediate success altogether too slender to develop any serious rivalry for a presidential nomination. Because its strength lay evidently among the former adherents of the now dissolved and abandoned Whig party, Seward naturally took highest rank in leadership; after him stood Chase as the representative of the independent Democrats, who, bringing fewer voters, had nevertheless contributed the main share of the courageous pioneer work. It is, however, a just tribute to their sagacity that they were willing to wait for the maturer strength and riper opportunities of the new organization. Mr. Justice McLean of the Supreme Bench, an eminent jurist, a faithful Whig, whose character happily combined both the energy and the conservatism of the great West, also had a large following; but as might have been expected, the convention found a more typical leader, young in years, daring in character, brilliant in exploit; and after one informal ballot it nominated John C. Frémont of California. The credit of the selection and its successful management has been popularly awarded to Francis P. Blair, senior, somewhat famous as the talented and powerful newspaper lieutenant of President Jackson; but it was rather an intuitive popular choice, which at the moment seemed so indisputably appropriate as to preclude necessity for artful intrigue.

There was a dash of romance in the personal history of Frémont which gave his nomination a high popular relish. Of French descent, born in Savannah, Georgia, orphaned at an early age, he acquired a scientific education largely by his own unaided efforts in private study; a sea voyage as teacher of mathematics, and employment in a railroad survey through the then wilderness of the Tennessee Mountains, developed the taste and the qualifications that made him useful as an assistant in Nicollet's scientific exploration of the great plateau where the Mississippi River finds its sources, and secured his appointment as second lieutenant of topographical engineers. These labors brought him to Washington, where the same Gallic restlessness and recklessness which had rendered the restraint of schools insupportable brought about an attachment, elopement, and

MILLARD FILLMORE. (FROM A DAGUERRETYPE.)

marriage with the daughter of Senator Benton of Missouri.

Reconciliation followed in good time; and the unexplored great West being Benton's peculiar hobby, through his influence Frémont was sent with an exploring party to the Rocky Mountains. Under his command similar expeditions were repeated again and again to that yet mysterious wonderland; and never were the wildest fictions read with more avidity than his official reports of daily adventure and danger and discovery, of scaling unclimbed mountains, wrecking his canoes on the rapids of unvisited rivers, parleying or battling with hostile Indians, or facing starvation while hemmed in by trackless snows. One of these journeys had led him to the Pacific coast when our war with Mexico let loose the spirit of revolution in the then Mexican province of California. With the abandon of a petrel in a storm, Frémont joined his little company of explorers to the insurrectionary faction, organized the revolt, improvised and took command of a mounted regiment, overturned the tottering local Mexican authority and put her remnant of officials to flight, setting up instead a temporary government under a declaration of independence.

With others he skillfully assisted in turning this movement into a conquest of the country for the United States; and when through the famous gold discoveries California was soon afterwards organized and admitted as a new State of the Union, Frémont became for a brief period one of her first United States Senators.

So salient a record could not well be without strong contrasts, and of these unsparing criticism took advantage. High romance was changed to merciless ridicule by thousands of sharp newspaper quills in the savage dissections to which presidential candidates are subjected. Hostile journals delineated Frémont as a shallow, vainglorious, "woolly-horse," "mule-eating," "free-love," "nigger-embracing" black Republican; an extravagant, insubordinate, reckless adventurer; a financial spendthrift and political mountebank. As the reading public is not always skillful in winnowing truth from libel when artfully mixed in print, even the grossest calumnies were not without their effect in contributing to his defeat. To the sanguine zeal of the new Republican party, however, Frémont was for the hour a heroic and ideal leader; for upon the vital point at issue, his antislavery votes and

clear declarations satisfied every doubt and inspired unlimited confidence.

However picturesquely Frémont for the moment loomed up as the standard-bearer of the Republican party, future historical interest centers upon the second act of the Philadelphia convention. It shows us how strangely to human wisdom vibrate the delicately balanced scales of fate; or rather how inscrutable

being scattered among thirteen other names.* The dominating thought of the convention being the assertion of principle, and not the promotion of men, there was no further contest;† and though Mr. Dayton had not received a majority support, his nomination was nevertheless at once made unanimous. Those who are familiar with the eccentricities of nominating conventions when in this listless and drift-

JOHN C. FRÉMONT. (FROM A STEEL PLATE IN POSSESSION OF MRS. FRÉMONT.)

and yet how unerring are the far-reaching processes of divine providence. The principal candidate having been selected without contention or delay, the convention proceeded to a nomination for Vice-President. On the first informal ballot William L. Dayton of New Jersey received 259 votes and Abraham Lincoln of Illinois 110; the remaining votes

ing mood know how easily an opportune speech from some eloquent delegate or a few adroitly arranged delegation caucuses might have reversed this result; and imagination may not easily construct the possible changes in history which a successful campaign of the ticket in that form might have wrought. What would have been the consequences to America and

Clay of Kentucky, 3; Jacob Collamer of Vermont, 15; William F. Johnston of Pennsylvania, 2; Nathaniel P. Banks of Massachusetts, 46; Henry Wilson of Massachusetts, 7; William Pennington of New Jersey, 1; — Carey of New Jersey, 3; S. C. Pomeroy of Kansas, 8; J. R. Gid-

dings of Ohio, 2. The vote in detail for Lincoln was: Maine, 1; New Hampshire, 8; Massachusetts, 7; Rhode Island, 2; New York, 3; Pennsylvania, 11; Ohio, 2; Indiana, 26; Illinois, 33; Michigan, 5; California, 12.

† Mr. T. S. Van Dyke, son of one of the delegates to Philadelphia, kindly writes us: "Nothing that Mr. Lincoln has ever written is more characteristic than the following note from him to my father just after the

humanity had the Rebellion, even then being vaguely devised by Southern Hotspurs, burst upon the nation in the winter of 1856, with the nation's sword of commander-in-chief in the hand of the impulsive Frémont, and Lincoln, inheriting the patient wariness and cool blood of three generations of pioneers and Indian-fighters, wielding only the powerless gavel of Vice-President? But the hour of destiny had not yet struck.

The platform devised by the Philadelphia convention was unusually bold in its affirmations, and most happy in its phraseology. Not only did it "deny the authority of Congress, or of a territorial legislature, of any individual or association of individuals, to give legal existence to slavery in any territory of the United States;" it further "Resolved, that the Constitution confers upon Congress sovereign power over the territories of the United States for their government, and that in the exercise of this power it is both the right and the duty of Congress to prohibit in the territories those twin relics of barbarism,—polygamy and slavery." At Buchanan, recently nominated by the Democratic National Convention in Cincinnati, it aimed a barbed shaft: "Resolved, that the highwayman's plea that 'might makes right,' embodied in the Ostend circular, was in every respect unworthy of American diplomacy, and would bring shame and dishonor upon any government or people that gave it their sanction." It demanded the maintenance of the principles of the Declaration of Independence, of the Federal Constitution, of the rights of the States, and the union of the States. It favored a Pacific railroad, congressional appropriations for national rivers and harbors; it affirmed liberty of conscience and equality of rights; it arraigned the policy of the Administration; demanded the immediate admission of Kansas as a State, and invited "the affiliation and coöperation of men of all parties, however differing from them in other respects, in support of the principles declared."

The nominees and platform of the Philadelphia convention were accepted by the opposition voters of the free States with an alacrity and an enthusiasm beyond the calculation of even the most sanguine; and in November a vote was recorded in their support which, though then unsuccessful, laid the secure foundation of an early victory, and permanently established a great party destined to carry the country through trials and vicissitudes equal in

convention—not for publication, but merely as a private expression of his feelings to an old acquaintance:

SPRINGFIELD, ILL., June 27, 1856.

HON. JOHN VAN DYKE.

MY DEAR SIR: Allow me to thank you for your kind notice of me in the Philadelphia convention.

(FROM A PHOTOGRAPH BY MOSES E. ERTZ.)

magnitude and results to any which the world had hitherto witnessed.

In the present year none of the presidential honors were reserved for the State of Illinois. While Lincoln thus narrowly missed a nomination for the second place on the Republican ticket, his fellow-citizen and competitor, Douglas, failed equally to obtain the nomination he so much coveted as the candidate of the Democratic party. The Democratic national convention had met at Cincinnati on the 2d day of June, 1856. If Douglas flattered himself that such eminent services as he had rendered the South would now find their reward, his disappointment must have been severe. A frequent phenomenon of human nature again occurred. While the benefits he had conferred were lightly estimated or totally forgotten, former injuries inflicted in his name were keenly remembered and resented. But three prominent candidates, Buchanan, Pierce, and Douglas, were urged upon the convention. The indiscreet crusade of Douglas's friends against "old fogies" in 1852 had defeated Buchanan and nominated Pierce; now, by the turn of political fortune, Buchanan's friends were able to wipe out the double score by defeating both Pierce and Douglas. The bulk of the Southern delegates seem to have been guided by the mere instinct of present utility; they voted to renominate Pierce,

"When you meet Judge Dayton present my respects, and tell him I think him a far better man than I for the position he is in, and that I shall support both him and Colonel Frémont most cordially. Present my best respects to Mrs. V., and believe me, Yours truly,
"A. LINCOLN."

because of his subservient Kansas policy, forgetting that Douglas had not only begun it, but was their strongest future ally to continue it. When after a day of fruitless balloting they changed their votes to Douglas, Buchanan, the so-called "old fogey," just returned from the English mission, and therefore not handicapped by present personal jealousies and heart-burnings, had secured the firm adhesion of a decided majority, mainly from the North.* The "two-thirds rule" was not yet fulfilled, but at this juncture the friends of Pierce and Douglas yielded to the inevitable, and withdrew their favorites in the interest of "harmony." On the seventeenth ballot, therefore, and the fifth day of the convention, James Buchanan of Pennsylvania became the unanimous nominee of the Democratic party for President, and John C. Breckinridge of Kentucky for Vice-President.

The famous "Cincinnati platform" holds a conspicuous place in party literature for length, for vigor of language, for variety of topics, for boldness of declaration; and yet, strange to say, its chief merit and utility lay in the skillful concealment of its central thought and purpose. About one-fourth of its great length is devoted to what to the eye looks like a somewhat elaborate exposition of the doctrines of the party on the slavery question. Eliminate the verbiage and there only remains an indorsement of "the principles contained in the organic laws establishing the Territory of Kansas and Nebraska" (non-interference by Congress with slavery in State and territory, or in the District of Columbia); and the practical application of "the principles" is thus further defined:

"Resolved, that we recognize the right of the people of all the territories, including Kansas and Nebraska, acting through the legally and fairly expressed will of a majority of actual residents, and whenever the number of their inhabitants justifies it, to form a Constitution with or without domestic slavery, and be admitted into the Union upon terms of perfect equality with the other States."

We have already seen how deliberately the spirit and letter of "the principle" was violated by the Democratic national administration of President Pierce, and by nearly all the Democratic Senators and Representatives in Congress; and we shall see how the more explicit resolution was again even more flagrantly

violated by the Democratic national administration and party under President Buchanan.

For the present, however, these well-rounded phrases were especially convenient; first, to prevent any schism in the Cincinnati convention itself, and, secondly, to furnish points for campaign speeches; politicians not having any pressing desire, nor voters the requisite critical skill, to demonstrate how they left untouched the whole brood of pertinent queries which the discussion had already raised, and which at the very next national convention were destined to disrupt and defeat the Democratic party. For this occasion the studied ambiguity of the Cincinnati platform made possible a last coöperation of North and South, in the face of carefully concealed mental reservations, to secure a presidential victory.

It is not the province of this work to describe the incidents of the national canvass, but only to record its results. At the election of November, 1856, Buchanan was chosen President. The popular vote in the nation at large stood: Buchanan, 1,838,169; Frémont, 1,341,264; Fillmore, 874,534. By States Buchanan received the votes of fourteen slave States and five free States, a total of 174 electors; Frémont the vote of eleven free States, a total of 114 electors; and Fillmore the vote of one slave State, a total of eight electors.†

Our recital has carried us forward beyond the regular order of chronological events; we must therefore turn back and once more take up the thread of local political history in the State of Illinois. Among the other work of the Bloomington convention was the nomination of a full ticket of Presidential electors, at the head of which was placed Abraham Lincoln. While this was a gratifying mark of honor, it was also a somewhat onerous post of duty, involving a laborious campaign of speech-making in support of the Republican presidential ticket. This duty Mr. Lincoln performed with faithful zeal, making about fifty speeches before election. Among the addresses which he thus delivered in the different counties, it is interesting to read a fragment of a speech he made at Galena, Illinois, discussing the charge of "sectionalism," the identical pretext upon which the South inaugurated its rebellion against his administration four years afterward:

* On the sixteenth ballot Buchanan received 168 votes, of which 121 were from the free States and 47 from the slave States; Douglas received 122 votes, of which 49 were from the free States and 73 from the slave States; Cass received 6 votes, all from the free States; Pierce had been finally dropped on the previous ballot.—"Proceedings of Cincinnati Convention," p. 45.

† The vote more in detail was: For Buchanan, slave States, Alabama, 9; Arkansas, 4; Delaware, 3; Flor-

ida, 3; Georgia, 10; Kentucky, 12; Louisiana, 6; Mississippi, 7; Missouri, 9; North Carolina, 10; South Carolina, 8; Tennessee, 12; Texas, 4; Virginia, 15. Free States, California, 4; Illinois, 11; Indiana, 13; New Jersey, 7; Pennsylvania, 27. Total, 174.

For Frémont, free States, Connecticut, 6; Iowa, 4; Maine, 8; Massachusetts, 13; Michigan, 6; New Hampshire, 5; New York, 35; Ohio, 23; Rhode Island, 4; Vermont, 5; Wisconsin, 5. Total, 114.

For Fillmore, slave State, Maryland, 8.

"You further charge us with being disunionists. If you mean that it is our aim to dissolve the Union, I for myself answer that it is untrue; for those who act with me I answer that it is untrue. Have you heard us assert that as our aim? Do you really believe that such is our aim? Do you find it in our platform, our speeches, our conventions, or anywhere? If not, withdraw the charge.

"But you may say that though it is not our aim, it will be the result, if we succeed, and that we are therefore disunionists in fact. This is a grave charge you make against us, and we certainly have a right to demand that you specify in what way we are to dissolve the Union. How are we to effect this?

"The only specification offered is volunteered by Mr. Fillmore in his Albany speech. His charge is that if we elect a President and Vice-President both from the free States it will dissolve the Union. This is open folly. The Constitution provides that the President and Vice-President of the United States shall be of different States; but says nothing as to the latitude and longitude of those States. In 1828 Andrew Jackson of Tennessee and John C. Calhoun of South Carolina were elected President and Vice-President, both from slave States; but no one thought of dissolving the Union then on that account. In 1840 Harrison of Ohio and Tyler of Virginia were elected. In 1841 Harrison died and John Tyler succeeded to the presidency, and William R. King of Alabama was elected acting Vice-President by the Senate; but no one supposed that the Union was in danger. In fact, at the very time Mr. Fillmore uttered this idle charge, the state of things in the United States disproved it. Mr. Pierce of New Hampshire and Mr. Bright of Indiana, both from free States, are President and Vice-President, and the Union stands and will stand. You do not pretend that it ought to dissolve the Union, and the facts show that it won't; therefore the charge may be dismissed without further consideration.

"No other specification is made, and the only one that could be made is, that the restoration of the restriction of 1820 making the United States territory free territory would dissolve the Union. Gentlemen, it will require a decided majority to pass such an act. We, the majority, being able constitutionally to do all that we purpose, would have no desire to dissolve the Union. Do you say that such restriction of slavery would be unconstitutional, and that some of the States would not submit to its enforcement? I grant you that an unconstitutional act is not a law; but I do not ask and will not take your construction of the Constitution. The Supreme Court of the United States is the tribunal to decide such a question, and we will submit to its decisions; and if you do also, there will be an end of the matter. Will you? If not, who are the disunionists, you or we? We, the majority, would not strive to dissolve the Union; and if any attempt is made it must be by you, who so loudly stigmatize us as disunionists.

But the Union, in any event, will not be dissolved. We don't want to dissolve it, and if you attempt it we won't let you. With the purse and sword, the army and navy and treasury in our hands and at our command, you could not do it. This government would be very weak indeed if a majority with a disciplined army and navy and a well-filled treasury could not preserve itself, when attacked by an unarmed, undisciplined, unorganized minority. All this talk about the dissolution of the Union is humbug, nothing but folly. We do not want to dissolve the Union; you shall not."

With three presidential tickets in the field — with the Democrats seeking the election of

Buchanan and Breckinridge, the Americans, or Know-Nothings, asking votes for Fillmore and Donelson, and the Republicans making proselytes for Fremont and Dayton — the political campaign of 1856 was one of unabated activity and excitement. In the State of Illinois the contest resulted in a drawn battle. The American party held together with tolerable firmness in its vote for President, but was largely disintegrated in its vote on the ticket for State officers. The consequence was that Illinois gave a plurality of 9164 for Buchanan, the Democratic candidate for President, while at the same time it gave a plurality of 4729 for Bissell, the Republican candidate for governor.[†]

Half victory as it was, it furnished the Illinois Republicans a substantial hope of the full triumph which they achieved four years later. About a month after this election, at a Republican banquet given in Chicago on the 10th of December, 1856, Abraham Lincoln spoke as follows, partly in criticism of the last annual message of President Pierce, but more especially as an unsleeping leader and prophet sounding a new battle-call and pointing out the rising star of promise:

"We have another annual presidential message. Like a rejected lover making merry at the wedding of his rival, the President felicitates himself hugely over the late presidential election. He considers the result a signal triumph of good principles and good men, and a very pointed rebuke of bad ones. He says the people did it. He forgets that the 'people,' as he complacently calls only those who voted for Buchanan, are in a minority of the whole people by about four hundred thousand votes — one full tenth of all the votes. Remembering this, he might perceive that the 'rebuke' may not be quite as durable as he seems to think — that the majority may not choose to remain permanently rebuked by that minority.

"The President thinks the great body of us Frémonters, being ardently attached to liberty, in the abstract, were duped by a few wicked and designing men. There is a slight difference of opinion on this. We think he, being ardently attached to the hope of a second term, in the concrete, was duped by men who had liberty every way. He is the cat's-paw. By much dragging of chestnuts from the fire for others to eat, his claws are burnt off to the gristle, and he is thrown aside as unfit for further use. As the fool said of *King Lear*, when his daughters had turned him out-of-doors, 'He's a shelled peascod.' [That's a sheal'd peascod.]

"So far as the President charges us 'with a desire to change the domestic institutions of existing States,' and of 'doing everything in our power to deprive the Constitution and the laws of moral authority,' for the whole party on belief, and for myself on knowledge, I pronounce the charge an unmixed and unmitigated falsehood.

"Our government rests in public opinion. Whoever can change public opinion can change the government practically just so much. Public opinion, on any subject, always has a 'central idea,' from which all its minor thoughts radiate. That 'central idea' in our polit-

* Galena "Advertiser," copied into the Illinois "State Journal," August 8th, 1856.

† For President, Buchanan (Dem.), 105,344; Fré-

mont (Rep.), 96,180; Fillmore (Am.), 37,451. For Governor, Richardson (Dem.), 106,643; Bissell (Rep.), 111,372; Morris (Am.), 19,241.

ical public opinion at the beginning was, and until recently has continued to be, 'the equality of men.' And although it has always submitted patiently to whatever of inequality there seemed to be as matter of actual necessity, its constant working has been a steady progress towards the practical equality of all men. The late presidential election was a struggle by one party to discard that central idea and to substitute for it the opposite idea that slavery is right in the abstract, the workings of which as a central idea may be the perpetuity of human slavery and its extension to all countries and colors. Less than a year ago the Richmond 'Enquirer,' an avowed advocate of slavery, regardless of color, in order to favor his views, invented the phrase 'State equality,' and now the President, in his message, adopts the 'Enquirer's' catch-phrase, telling us the people 'have asserted the constitutional equality of each and all of the States of the Union as States.' The President flatters himself that the new central idea is completely inaugurated; and so indeed it is, so far as the mere fact of a presidential election can inaugurate it. To us it is left to know that the majority of the peo-

ple have not yet declared for it, and to hope that they never will. All of us who did not vote for Mr. Buchanan, taken together, are a majority of four hundred thousand. But in the late contest we were divided between Frémont and Fillmore. Can we not come together for the future? Let every one who really believes, and is resolved, that free society is not and shall not be a failure, and who can conscientiously declare that in the past contest he has done only what he thought best, let every such one have charity to believe that every other one can say as much. Thus let by-gones be by-gones; let past differences as nothing be; and with steady eye on the real issue, let us reinaugurate the good old 'central ideas' of the Republic. We can do it. The human heart is with us, God is with us. We shall again be able not to declare that 'all States as States are equal,' nor yet that 'all citizens as citizens are equal,' but to renew the broader, better declaration, including both these and much more, that 'all men are created equal.' " *

KEATS.

DEATH hath his fancies, and why not? A
king

So great as he must have his royal whim,—
Sometimes a fool, sometimes the wailing string
Of some slain minstrel's harp, must humor
him.

There was a youthful singer once, a soul
Loved of the gods, and hence not loved of
men,
Who sang too well, and, shame to say, the
whole
Small race of songsters rose against him then.

And all the critics too — like daws that peck
Some lustrous jewel from its golden set-
ting —
Beaked his fair lines, so, hastening on to wreck
The fragile bark that every flaw was fretting.

Love, also, with his barbéd baby spear
Racked all the chambers of his heart with
anguish;
But bravely through it all, more strong and
clear,
Went up his matchless song that would not
languish.

And all so well he pleased the sable king,
Though many a famous bard sang at his call,
That straight he sent his messenger to bring
This tortured soul which pleased him best
of all.

So Keats was brought, and when his strain
beguiled

The sad-faced king and his brave company
To strange, unwonted tears — Death kindly
smiled,
Approving his unequaled minstrelsy.

And when at times his watchful eye could trace
The swiftly passing spasm of fierce pain
Which swept across the minstrel's pallid face,
He quickly cried, "Thy songs were not in
vain;

"Fixed in the world's large memory they shall
live,
Undying as that beauty to whose shrine
Thy kneeling soul brought all thou hadst to
give;
All things of which thy heart once dreamed
are thine:

"As thou didst leave them they shall picture
thee
Both to thine own and far-off other lands,
And while men sing, thy name shall never
be
Forgotten in their songs." And so he stands,

A fair-formed image of immortal youth
Breasting the steep hillside of life's endeavor;
A white-robed herald of eternal truth
Shouting a message from the gods forever.

Robert Burns Wilson.

WHITSUN HARP, REGULATOR.

POLLY ANN SHINAULT was mending the Clover Bend ferry-boat. The ferry-boat was nothing more than an old scow, leaky and unruly. Lum, Polly Ann's husband, meant to mend it that morning; but Lum was scouring the bottom after a stray mule. So Polly Ann had pounded the head of the hatchet on the handle—they have a natural tendency to part and go their separate ways in a Southern yard—and was patching the leaks herself. They said at the Bend that Polly Ann was "pow'ful handy." She was a handsome young woman. Some blending of French and Spanish blood from the earliest Arkansas travelers had given her the mass of purple-black hair under her man's hat, the clear olive of her skin, her velvet black eyes, and delicate profile. Her eyelashes were long and thick and curled at the ends. Long eyelashes and small features are not uncommon in Arkansas faces. Did Polly Ann smile, she showed a rarer beauty, even little teeth, white as milk. But Polly Ann seldom smiled, being a silent, serious creature whose own husband felt a trifle in awe of her. Her primitive repairs completed, she straightened her bent shoulders, clasped her hands behind her neck, and looked about her. When she stood she was tall and erect as a young cypress.

Her eyes spanned the Black River flowing at her feet, and took in, without noting, the whitewashed walls of the mill, the store, and the score or two of houses that go with an Arkansas cotton plantation. The time was early in November. The cotton was ready for picking, and flakes of white spattered the brown fields. The yards were frowsy with stalks of gimson weed and withered grass. The great cypress forest shut in the cleared space like a wall. The scene was monotonous, yet about it was something somber and vast, a loneliness that the presence of the few low-browed houses seemed to mark rather than lessen. A little spiral of smoke drifting above a chimney here and there, some pigs dotting the sandy road, a few riderless horses patiently drooping their noses against the fence rail before the store, were the only signs of habitation. Behind Polly Ann lay the canebrake and the forest. The water mirrored the Shinault cabin with its one wee window and "stick and dirt" chimney.

During the war (not so far back by many years, that November day, as now) escaped prisoners used to hide in the canebrake. After the war runaway convicts from the stockade at Powhatan found shelter there sometimes, and then the cane would be crushed by the leaps of panting hounds; and many a night had Polly Ann shuddered, listening to the dogs baying, and picturing the wretch crouched among the sodden grasses.

Plenty of grim traditions hung, heavy as its own miasma, over the cypress swamp. Not a rod away was the bare spot, dented by cypress knees, where Old Man Bryce's cabin stood until the guerillas murdered him and his wife and burned their bones under their home. A whole company of guerillas had dangled from the sycamore limbs for that murder. The shapeless green in front of the store had been the scene of bloody quarrels. Down by the river bank, on the little knoll which the spring covered with wild flowers, Bud Boas had killed his partner. Boas was tried and acquitted; but his own conscience was not so lenient as men. As the slain man fell he had flung out his hand, touching Boas's cheek. Ever since, the unhappy slayer had been haunted by a touch. He would wake from sleep, screaming that he felt the hand. At his work, at home, at camp-meetings even, where he would go in the vain hope of eluding his persecutor, the tortured man might spring up, wildly rubbing his face, and rush away, or fall in convulsions horrible to see. From no other cause than this ghostly touch, he had seasons of drinking hard, but it was said that liquor could not blunt his senses.

Boas's cabin was near the Shinaults'; and this afternoon while Polly Ann stood looking, she saw his limp figure in butternut jeans slip through the store doorway and creep along the bank. Years ago Boas had been an exceptionally tall and strong man, bringing a backwoodsman's stature, muscle, and ruddy tan from the Tennessee mountains; now his stooping shoulders and lank chest matched the sickly pallor of his face, with its hollow cheeks and restless, faded eyes.

Approaching the shore, he hailed Polly Ann with a "Whoo—op!" She got into the scow and pushed off. She paddled as easily as an Indian. Meanwhile Boas had been joined by another man, who drew the boat up on the beach, saying, "How's all, Polly Ann?"

Polly Ann had not seen him until he spoke; and she flushed a little, as though from surprise.

"*You* come back, Whitsun Harp?" said she.

"Got back yistiddy," the man replied. He had a slow full voice, with a kind of severe melody in its cadence not in the least like the high-pitched Arkansas drawl. Whitsun Harp was a head shorter than Boas. He wore a blue flannel shirt, and brown jean trousers tucked into high boots, all quite whole and clean. His compact, powerful frame was not of the Arkansas type any more than his dark, square, resolute face; yet, in the phrase of the region, he had been "born and raised on the Black River bottom."

At first glance, one could see a resemblance between him and the young woman,—not a likeness of feature, but of manner and expression; both had the same direct, serious gaze, the same slow speech, and the same proud bearing. When Polly Ann reddened, Harp grew paler. The men stepped into the boat, and Polly Ann greeted Boas: "Howdy, Mr. Boas?"

"My health's mighty triflin'," answered Boas; "someway, I'm puny all the time; sorter mis'ry in my ches'; some days I feel pow'ful weak, caynt skeercely walk. Ora she 'lows she'll send fer Dr. Vinson, but I don't guess it's no use."

"Doctors does good sometimes," said Polly Ann.

"Say, Polly Ann," said Harp, "I heerd tell you all'd los' a mewl."

"Lum's went ayfter it," said Polly Ann; "we missed it Monday, an' we waited an' waited fer it to come back, an' it didn't, so Lum he's went ayfter it. Lum 'lows it's stole, he 'lows some cotton-picker toled it off."

"Looks like," assented Boas; "them cotton-pickers is mighty ornery folks."

Harp asked a few questions, short and to the point; and when the boat landed he drew Polly Ann aside, while Boas stooped to mend a dilapidated shoe with a rag.

"Polly Ann," said Harp, "I come to see ye. I'll tend to yo'mewl. Ye know I ar' turned regerlater."

"I've heerd tell on't."

"Wa'al, hit's so. I aim to mek these yere pyarts mo' decenter. Polly Ann, this yere's a turrible mean kentry, drinkin' an' sw'arin' an' fightin' an' devilment er all kin's o' goin' on! An' the chil'en bein' raised to drink an' fight an' die jes like we uns; Polly Ann, hit ain't right! An' thar ain't no need fer it to be, neether. I be'n in other settlements. They ain't like we all; they've got brick chimbleys, an' battened heouses, an' a school-heouse whar

they kin hev preachin', stiddier hevin' it in a loft like we all. We mought, too, but we're so triflin' we caynt mek a ruffle."

"Looks like," agreed Polly Ann politely.

"Yit how to help it? I'd lay an' study the hull night through, Polly Ann, studin' 'beout hit. The mo' I studied the wuss it looked. Wa'al—it war ayfter ye taken up with Lum an' war merried, hit come preachin' Sunday, an' I went ter preachin'. 'Twar the best out at preachin' I ever heerd. All 'beout calls. God called some on us one way an' some a tother, but we wuz all called ter his sarvice. An' I says ter myself, 'Lord, how ar' I called? I ar' the bes' blacksmith in the bottom, but I caynt talk wuth a shuck.' An', Polly Ann, a voice said back, cl'ar's a boat-whistle: 'Whitsun Harp, ye caynt talk folks decent, but ye kin lick 'em decent. They need a regerlater yere mo'n a preacher.' I jes growed cole all over, fur I war walkin' all by my lone self en the bottom, not a critter 'reoun' 'cept hoegs. 'Lord,' says I ter the sky, 'they'll kill me shore, if I turn regerlater an' lick 'em. An' w'at'll maw do then?' So I went home turrible troubled in my mind. Polly Ann, w'en I got home maw was in one ur'er spells, an' afore sundown she war dead. *Thet* war the Lord A'mighty's answer to my hesitatin'. Ayfter thet I went ter wuk. Fust I sarved notice on them men thet got drunk reg'lar Saturday nights at the store. Then I licked them thet persisted in wrong-doin'. I licked ole Skirey fer oppressin' the pore; an' I evened it up by lickin' two niggers thet wudn't do a fair day's wuk fer their wages. I licked Sol Looney fer fightin' with his wife, an' I licked a right smart fer stealin'—thet ar' 'beout all."

"Law me," said Polly Ann, admiring him, "but, Whitsun, don't they fight ye? Folks don't like ter be licked."

"They've got to fight or be licked—one. Mos' times I ar' too spry fer 'em an' take their knives an' pistils 'way. They did shoot a shoot at me wunst, but hit missed."

Polly Ann's dark eyes were shining through a mist of eagerness, and her lip quivered as she said: "But they mought hit ye!"

"Yes," said Harp quietly, while something gentle and unusual relaxed his features, a look at once patient and sad; "wa'al, ef they didn't kill me, I wud go on jes the same, an' ef hit *did*—I ain't no wife nur babies ter grieve ayfter me, an' I reckon the Lord kin tek keer Clover Bend some other way."

Polly Ann drew a deep breath. "Looks like 'twuz a call!" said she.

"'Tis a call, shore," said Harp solemnly; "I waynted ter tell ye so's ye wud know the truth 'beout it, folks lyin' so ginerally. It's no dif-

fer ter me 'beout the res', but I waynted *you* ter know bekase — we uns played tergether w'en we wuz little trucks, an' I allus tole ye everythin', ye remember."

She remembered. Perhaps she remembered more, for her cheeks grew red, and her brown fingers were clasped together so tightly that they made dents in the knuckles.

"An'," continued Harp very gently, "ef I shud hev ter do suthin' thet ye moughtn't like, hit's kase I *fer* ter an' not my seekin' — bein' called. Ye'll consider thet thar, Polly Ann?"

"I don't guess ye'll ever do nuthin' ye don' hole ter be right, Whitsun Harp."

"Thankee, Polly Ann," said Harp. He almost timidly touched her hand, holding it for a second in a loose clasp. Then he strode away without a glance at Boas. The latter rose directly and joined Polly Ann.

"Did Whitsun Harp say onythin' 'beout Lum ter ye?" said Boas.

"Naw," said Polly Ann; "w'at fer shud he?"

Boas seemed to have a difficulty in speaking; he had to clear his throat twice before he could say: "Wa'al, fact is, Polly Ann, he's heerd tell — wa'al, lies 'beout Lum like he be'n too much ter the store an' dances an' sich like tricks, an' Whitsun he 'lows Lum's triflin' an' — he's warned him."

"Warned — Lum?" cried Polly Ann.

"Said like he'd lick 'im, ef he don' quit," replied Boas with primitive directness. He laid the tips of his fingers on her sleeve, and his face grew earnest. "Fer the good Lord's sake, Polly Ann, don' ye let Lum mad Whitsun! Nary man en this bottom kin stan' agin him. Ye know Steve Elder, how big he is? He done stole a pa'r boots at the store. Whitsun he seen it, but he never let on; but w'en this yere Steve comes fer his acceount he fin's at the bottom, 'One pa'r boots, so much. Putt down by Whitsun Harp.' W'en he read thet 'ar he never opened 'is mouth. Jes paid. He knowed he cudn't stan' up agin Whitsun." All the while Boas talked he was scanning Polly Ann's face to see the effect of his words. "Thar war a circus feller too. He brung a mighty ornery, mean show ter the Bend, and Whitsun warned him not ter show thet ar show agin; but he pitched 'is tent an' wuz marchin' 'reoun' in front, a puttin' on doeg, w'en up comes Whitsun, an' he says, 'Didn't I warn ye not ter show yo' durned ondecient show yere?' sez 'e. An' he slapped up thet ar feller an' flung him 'cross a log an' pulled his belt 'reoun' an' yanked out 'is pistil an' flung hit cl'ar 'n' 'cross the road an' licked thet ar circus feller tell he hollered. An' ye 'member ole Skirey thet he guv the bud to, spiter him an' 'is two sons. He knocked the big un down, an'

the little one lit a shuck mighty spry. An' who killed the mad dog with a hammer? An' who held the wild hoeg by the tail tell Mark Lady cud stick 'im? — them two men off their hosses en the cane, an' their guns empty! Naw, naw, Polly Ann, don' let Lum mad Whitsun! An' 'tain't lickin's thets mos' ter fear." His woful eyes turned from Polly Ann's face in a fleeting, shrinking, indescribable glance towards the river bank — "they mought git — ter — fightin'!"

"I ain't feered fer Lum ef they do," said Lum's wife haughtily.

But no sooner had the well-meaning threatener gone than she ran into the cabin, shut the door, and flung her proud head on the table, in a passion of tears.

Lum Shinault came home by moonlight. His wife had saved his supper, and he stretched his legs out beneath the white oil-cloth with a sigh of content.

"My, my, my!" said Lum in his soft, pleasant voice, "talk 'beout cookin'! Polly Ann, ye allers git thar with both feet. Fried pork an' sop an' taters an' pie an' light bread! Onythin' mo' ter foller?"

A faint smile lifted the corners of Polly Ann's mouth. She knew her gifts, and appreciation is sweet. "I reckon," Lum continued, "hit meks a differ eatin' en a purty room. This yere's a right purty room, Polly Ann."

He looked about the room, and she looked at him. The room was poor and bare enough, with its log walls and uneven floor; but the big cotton-stuffed pillows on the bed shone out of the dusk; there was a clock on the rude mantelpiece, a red cushion on the black and gilt rocking-chair, and a log thicker than a man's body was blazing in the fire-place. The flames, rather than the sickly gleam of the grease lamp, lighted the room and Lum Shinault's face. He was of low stature and slight, and in the firelight he made one think of a terra-cotta figure, he was so all of a color, hair, skin, and clothes all the same, whitish-brown. But he had sparkling brown eyes and a sensitive mouth that could shut firmly. "Did ye fin' the mewl?" said his wife.

"Not a hide nur a ha'r er the blamed critter," answered Lum cheerfully, "but I seen a big gang er turkeys. Reckon I shot one, but I cudn't fin' hit."

"Whitsun Harp wuz yere; he 'lows he'll fin' the mewl fer us."

Lum whistled. His meal being finished, he got up and stood close to his wife. She had knotted a scarlet handkerchief about her throat, which suited her olive skin and black hair. Lum slid his arm around her waist. "Ye ar' turrible good-lookin', Polly Ann," said he smil-

ing half wistfully; "I sot a heap er store by ye."

She neither accepted nor repulsed the caress; merely stood, her hands clasped before her, absently gazing at the fire. His arm fell; but in a second he put out his hand again, to finger softly a stray lock of hair.

"An' Bud Boas, he was yere too," said Polly Ann; "he 'lows ye'd bes' be keerful kase Whitsun's mad at ye. He 'lows yo' too triflin'."

"An' I 'low Whitsun Harp's too meddlin'!" cried Lum, opening his brown eyes angrily. "W'at bus'ness ar' hit er his'n? I don' rent er him. 'Tain't his plantation. To my notion, Whitsun hed orter be run off this yere place!"

"He's did a heap er good yere," said Polly Ann—was it the firelight, Lum wondered, that made her cheeks so red?—"Look at the fightin's an' drinkin's he's stopped! Thar ain't be'n a man killed yere sence he turned reg-later."

"Thar'll be one killed mighty quick though ef he don' quit projickin' 'roun' an' lickin' folks permiscus'."

Polly Ann laid her hand on her husband's arm, looking down at him, for she was taller than he. "Lum," she said solemnly, "he is *called*, Whitsun is. They caynt hurt him till his work's did. Don' ye say anythin' agin 'im, Lum."

Lum's frown turned into a broad grin. "Oh, laws! called ter lick folks? Ef thet ain't the durndest trick!"

"But he is," she insisted; "he's hed signs an' tokens. Don' go agin 'im, Lum."

"Wa'al, honey," said Lum easily, "I ain't purportin' ter go agin 'im. He's too big a b'ar fer me ter tackle."

Polly Ann turned away abruptly. Lum looked after her, all the light-hearted carelessness gone out of his face. "'Pears like I jes cudn't please her nohow," he thought while he busied himself clearing the table. Lum had the habit of helping his wife about the house; he had acquired it helping his mother, Lum's father being "triflin'."

At the same time Polly Ann was thinking: "He won' fight hisself or run enter no danger, but he'll sick the rest on, an' him stan' by." She hardly noticed how deftly Lum wiped the dishes and brushed out the room. "Be ye too tired ter listen ter a leetle music, honey?" he said when he had put the broom behind the door.

"Naw," said Polly Ann, trying to smile, "I don't guess I'm ever too tired fer music."

Faint as the smile was, Lum welcomed it and took down his violin with a brighter face.

He played a long while; at first, simple

melodies of the plantation and the camp-meeting; then, as his thoughts drifted into other memories, they took their own shape in music rude as his life, but weird and sad like the cypress brake. Lum was born a musician. He had a wonderful ear but the scantiest knowledge, most of which came from a strolling violinist who had the swamp fever in Lum's cabin and left a book of songs for payment. Lum learned the songs by heart. They were as commonplace as possible, but the ideas, worn shabby through the handling of generations, were new and splendid to Lum. Why not? They could not have been any fresher to him if they had just been discovered. They lifted and adorned his notion of love. They aided the ever-increasing power which his wife exercised over his imagination. He thought of her in their language, which had a dignity and charming tenderness quite lacking in the speech of his birthplace where a man "took up with a girl and married her," making no more ado about it; the song words were so pretty and kind-sounding, it was like kissing a girl to say them. Lum was too shy to say them himself. Once he ventured to call Polly Ann "Darling," instantly blushing up to his eyes. She did not seem to mind, neither did she seem pleased. It was the way in which she always met her husband's affection. This passive endurance of his love had come to have a kind of terror for Lum. He could not understand his wife. To go back to the beginning,—as Lum did to-night on his violin strings,—he had married Polly Ann out of compassion. He was in the field when Old Man Gooden fell dead in a fit of apoplexy. He helped Polly Ann carry her father into the house, and he witnessed her passionate, dumb agony. Lum had a soft heart, unfettered except by a few rustic attentions to a certain pretty widow on the plantation, Mistress Savannah Lady. When he beheld Polly Ann's desolate condition his heart melted.

"Nary kin nigher'n the Sunk Lan's," mused Lum, "hit's turrible hard. An' she sot sich store by her paw, an' he muched* her so. They sorter kep' ter theyselves, too, I don't guess they wuz the socherbel kin'. Nary un waitin' on 'er neether, 'less hit ar' Whitsun Harp. Ef he don' merry her, I reckon I hed orter. 'Tain't no mo'n neighborly."

Whitsun making no sign, he carried out his intention.

Polly Ann assented gravely, almost silently, to whatever he proposed. Nothing was easier than to rent a cabin and a pair of mules from the Northern men who had bought the plantation, and settle down "to raise a crop."

*To much; Arkansas for to pet, to caress, to make much of.

Polly Ann, after the first outburst, put her grief stonically away and only worked the harder. Polly Ann's father came from the "Sunk Lands," that mysterious region created by the great Lisbon earthquake, an island in the swamps, half the year cut off from the world, forgotten except by a few traders. Until she was fifteen she had lived the solitary life of the people and grown up in their Indian-like reticence. When she was fifteen, her mother died and her father took her to Clover Bend. She was now twenty-three years old, and she had been married hardly five months. Lum was a man of the lowlands, who inherited French instincts of sociability and liked idling about and gossiping. He took his new relations lightly at first, but soon his wife's stronger nature fascinated him. She awakened all the ardor and tenderness in him, this beautiful, silent, haughty, patient woman. "She ar' fairer nur the flowers," quoted Lum from the songs; "an' she's got a right smart er sense too," he added in the vernacular. He declared his wife's superiority with much frankness. "Law me," said he to Boas,—it was a few days later, and they sat on the store counter, indulging in the unpretending luxury of brown sugar and crackers,— "law me, Polly Ann's wuth a hull crap er me! Ye'd orter see the plunder she've bought, pickin' cotton—"

"Wa'al, then," interrupted Boas, dropping his customary mild, plaintive drawl to a lower key, "w'y fur be ye so possessed ter cavoort 'reoun' with Savannah Lady?"

"Me!" exclaimed Lum.

"Yes, jes *you*," repeated Boas with an anxious gaze into Lum's scarlet face. "They 'lows like ye taken up with 'er. Boy, ye hadn't orter be agwine on thet way! Nur ye hadn't orter come yere, fiddlin' an' carryin' on, an' yo' wife ter home, by her lone self, studyin' an' grievin'—"

"Polly Ann don' grieve," said Lum rather sullenly; "leastways she don' grieve ayfter me, nohow. In co'se I mean," he went on quickly, "she ar' grievin' fer her paw."

"In co'se," said Boas. There was a pause.

"An' ez regardin' Mistress Lady," Lum said finally, giving the full prefix with dignity,—on ordinary occasions one would only say "Mis'" in Arkansas,— "we uns wuz raised together an' natchelly have frien'ly feelin's. But ef ye ar' 'lowin' thet I even her or ary nother lady ter Polly Ann ye ar' a long sight outer yo' reckonin', thet's all. I know I taken her ter the singin' school the fiddler hed; but Polly Ann never'd go thar ter singin', kase—wa'al, Polly Ann jes natchelly cayn't sing, cayn't cotch a tune. An' ez fer me goin' ter the store an' drinkin', I disre-

member how often I done come yere; but I know I never got drunk onywhar, not the least bit on earth. But I ain't purportin' to be goin' yere ter fiddle nights, Bud Boas, never no mo'. Folks ain't got no call ter say I don' ruther stay by Polly Ann than onywhar nelse."

"Thet's so," said Boas. "I knawed they wuz lyin'." Lum did not tell Boas that he only went to the store because he thought Polly Ann did not care to see him home, and his heart was sore. He could not say that, since it would seem like complaining of Polly Ann. But Boas's caution set him thinking; gossip must be loud to rouse that haunted soul from its dream of pain.

"Thet thar's w'at Whit Harp hez heerd, dad burn him," growled Lum, "an' blame my skin ef I don' b'lieve thet ar Savannah ar' jes foolin' with me fur ter tol on Steve Morrow." Which it happened was precisely the case. Savannah wanted to marry the stockman, Morrow, and she used Lum to help her, not at all sorry to make Polly Ann jealous, if she could, as well as Morrow. "Ain't thet thar jes like the critter?" said Lum with perfect good humor; "it's a rig on me an' Steve though." Yet he felt a queer resentment against Harp—a resentment not diminished by the sight of his lost mule munching cotton stalks in his own field. "Whitsun fotched 'im," Polly Ann explained. It seemed to Lum that she spoke as though proud of Harp's success. Lum, the best-tempered man on the plantation, ground his teeth. "I sw'ar I hate thet thar Whitsun Harp!" he was thinking.

The next time that he saw Harp was mail day. Twice a week a rider brought the mail to Clover Bend. The post-office was in the store, just as the court-room was, whenever the majesty of the law was invoked or a jail needed. The store had a wide platform the right height to serve instead of a horse block. Savannah Lady rode up to the platform as Whitsun came through the door. She was a pretty, kittenish, fair little woman, and her hair, which was of a lovely reddish-brown color, had a trick of escaping in little ringlets and blowing round her white neck. After all, there was no great harm in her; but to Harp she was the embodiment of all that was dangerous and alluring in woman.

Lum was on the platform so near that common gallantry required him to help her alight. Somehow she stumbled, so he held her for a second by the elbows. Harp, black as night, watched her recover herself, laugh, blush, and flutter into the store. He strode up to Lum. "Lum Shinault," said he in a low tone and very deliberately, "ef ye don' quit yo' ornery triflin' ways I'll lick ye!"

"Then I'll kill ye, shore's death, Whitsun Harp!" Lum gasped, choked with passion.

Whitsun only gave him a steady gaze and turned on his heel.

Lum felt himself despised.

A week went by. Polly Ann was conscious of a change in Lum. Though kind as ever, his shy caresses were no longer offered. He worked harder and seldom went to the store, "an' he jis' studies the plum w'ile," said Polly Ann.

One day Mrs. Boas came over to ask Lum to get some quinine and whisky at the store for Boas. "He hed one er 'is spells,"—so the poor wife always named Boas's fits of terror,— "an' he run out en the woods an' got soppin' wet an' cotched cole an' 'pears like hit gits a leetle mucher all the w'ile."

After Lum was gone Polly Ann bethought herself of some corn which should be ground, and that it was grinding day at the mill. Like the store, the mill was a versatile and accommodating establishment, ginning cotton, sawing wood, or grinding corn with equal readiness. So saddling the big gray horse, which was at once her dowry and her inheritance, she led him to the ferry and paddled boat, horse, and woman across the stream. The Clover Bend ferry was deserted, but it was accustomed to desertion, being conducted on Southern principles: if you came when the ferryman was away you must wait until he got back, that was all.

Polly Ann saw Lum's wagon-box boat on the sand, and riding up the bank she perceived Lum himself walking through the cypress brake.

"Cypress Swamp," or the "Black River bottom," is like a dry river channel winding through the higher land. When the spring overflow comes the lustrous green water rushes among the tree trunks, and the high land becomes a multitude of islands and peninsulas; but most of the year the channel is dry, and in autumn the cypress boughs spread a soft russet carpet on the ground; the hackberry, maples, live-oaks, and holly-trees which mingle with the cypress splash the foliage with splendid hues, the sunlight filters through the branches and prints shifting shadows of the vines masking the thorn-trees, or turns the red berries into dots of flame. Then the cypress brake is beautiful. But Lum Shinault was not thinking of its beauty. He was walking slowly, his head sunk between his shoulders.

"Studyin'!" said Polly Ann.

Lum looked up. The silhouette of a horse's head had fallen across his path. A sun-bonnet was bent over the mane. The bonnet hid the woman's face, but that ringlet of dazzling hair, floating under the cape, could only belong to one person. Horse and rider stopped. So did the footman. His shadow spread out gigantic on the ground. Then both shadows were

blended together as if in an embrace. Did Polly Ann grow angry? Not in the least; she could see too well.

"W'ats got Savannah Lady?" said she; "looks like Lum was guvin' 'er w'isky an' holdin' uv 'er."

This, indeed, was what he was doing. For once there was no guile about Savannah's acts; Lum had served her turn. Young Morrow had spoken, and she was on her way to buy her wedding finery when she was seized with a chill; but she still rode on, clinging to her horse's neck, until she met Lum. He gave her some whisky.

Now by an evil chance, at this moment, Whitsun Harp must needs enter the scene on a gallop. He saw the shadows, he saw the bright head on Lum's shoulder, the little hands clutching Lum's arm.

A shower of cypress boughs whirled in the air; a pawpaw branch snapped, wrenched away by a furious hand; and Lum lifted his eyes to see Whitsun's face.

"I tell ye, yo' mistaken!" shouted Lum.

"It's too late for talking now," said Whitsun, deep and low.

He jumped off his horse and caught Lum by the throat. The smaller man was like a baby in his grip. Lum, writhing and struggling in an impotent fury of rage and shame, hardly felt the blows. Suddenly the hand at his throat released him so suddenly that he was hurled to the ground; he heard his wife's voice, shrill with anger: "Whitsun Harp, w'at ye doin' ter my man?"

He sat up, his brain swimming, specks of fire and blood floating in the air; but there was Whitsun standing empty-handed, and Polly Ann's face over the gray's head.

"I didn't aim ye shud ever know on 't, Polly Ann," said Whitsun, "I cudn't holp it, hit hed ter be did."

"I'll never fergive ye en this worl', Whitsun Harp!" said Polly Ann.

Lum put his hands on the tree near him and got to his feet. He leaned on the tree and steadied his choked and shaking voice enough to say, "Look a yere, Whitsun Harp, I'll kill ye fer this."

Harp did not glance toward him; he took one step forward as though he would speak to Polly Ann, but at her gesture of repulsion he turned silently and mounted his horse. On horseback, he reined in his horse, and looking at Polly Ann, said again, "I cudn't holp it," before he galloped away.

Savannah was shivering and crying.

"Hit *you* ary lick, Savannah?" said Lum.

"Naw, naw," sobbed she. "Oh, Lum, oh, Mis' Shinault, 'twan't my fault! I war jes sick. Whitsun's heerd lies on me 'n' Lum. I'm goin'

"THEN I'LL KILL YE, SHORE'S DEATH."

ter be merried ter Steve Morrow nex' week. Fer the Lord's sake, don' tell 'im; he wudn't never speak ter me agin! I done my best! I pulled Whitsun's arm."

For all his misery Lum burst into a bitter laugh. "Muster hendered Whitsun a heap, *you* holdin' on," said he. "You go 'long home, Savannah, an' don' be skeered er we uns tellin'; jes tek keer ye don' let on nuthin' yo'self—never min' w'at happens!"

Something in his face checked her answer; she was scared, and glad to ride away.

The husband and wife were left alone together.

Lum looked at Polly Ann, who was very pale. "Ye come jes in time, Polly Ann," said he.

"I wudn't o' b'lieved ye'd a taken it, Lum Shinault," said she bitterly, "with yo' knife on too. Pull yo' belt 'reoun'!"

VOL. XXXIV.—17.

Mechanically, Lum put his hand to his belt, which had been twisted so that the knife was in the back. "I done forgot 'beout the knife," muttered Lum, reddening; "thet ar's a favorite trick er Harp's." Then, in a second, he added: "I ain't goin' ter tek hit, Polly Ann."

She said nothing.

"Ye don' b'lieve me," cried Lum.

"'Tain't no use talkin'," said she wearily.

"I'll hev it out with 'im. Ye 'low I'm a ornery, triffin,' pusillanimous—"

"Whar's the use callin' yo'self names?" interrupted Polly Ann. "I don' wanter yere no mo' 'beout it. Reckon Boas'll waynt 'is w'isky onyhow. Thar 'tis un'er the gum-tree." Lum looked at his wife with imploring eyes and quivering mouth; at that moment he was longing to fling his arms about her and sob out

POLLY ANN.

She rode on a little way and stopped. "I'm goin' ter hev a plum good dinner fer ye, Lum," she called back.

"Thankee, Polly Ann," said Lum. He watched her until the trees hid horse and rider. "Polly Ann 'lows thar ain't no troubles men persons cayn't cure with eatin' an' drinkin'," said he; "drinkin',"—he eyed the whisky bottle lying at the foot of the gum-tree,—“naw, thar ain't ony comfort fer me en thet ar. I'm en a hole, an' thar's jes one way outen hit. No good talkin' ter Polly Ann, she's sot. 'Twud on'y pester her. Oh, my Lord, ain't it hard!

"I wisht I cud hev kissed her jes wunst," he said, after a while, "on'y fer ter say good-bye. How soft her cheek wuz! An' thar war a little blue vein jes un'er the ear. Wa'al, hit won' mek no differ ter her, but I wisht—"

He walked on slowly until he came to the boat on the sand. He could see his own cabin. He remembered the day that he brought Polly Ann to it—his wedding-day. He crawled into the boat, lay down in the stern, and cried like a child.

PART II.

POLLY ANN's good dinner waited in vain. Lum did not come. Yet she was sure that, while at the well drawing water, she had seen his figure through the window. She blew the horn. She called at the

his shame on her breast. Poor Lum's grandfather was a Frenchman.

Polly Ann did not look at him, but went on arranging her bag of corn; all Lum could see was the profile of her sun-bonnet—there is nothing sympathetic about a sun-bonnet. "Bes' git on ter the mill ef I waynt a pone er bread terday," said Polly Ann. "Be back ter dinner, Lum."

top of her voice. Finally she went to the shed to see if the horse was gone. Gone he was, and there was a piece of brown wrapping-paper, such as they used at the store, tacked on to a log and directed to "Mistris Shinalt." She took it down, turned it over, and saw a single sentence, written in pencil, in cramped, careful letters: "Darling Polly an i taken your

Hoss fer a Errant i wunt be bak your Lovin Husban. C. Shunalt."

"Law me!" said Polly Ann, "he mought hev comen anyhow. An' the dinner's plum spiled."

She was wretched over the morning's work, but she did not feel alarmed, having no belief in Lum's courage; and when she discovered that the gun was gone, she merely thought that he meant to shoot squirrels.

But Lum was seeking other game. His errand was to kill Whitsun Harp. The smoldering jealousy and resentment of weeks had burst into a flame that was shriveling his heart. He had been beaten before his wife, his wife who valued strength and bravery beyond everything. And Whitsun, whom she praised because he was so strong and brave, had beaten him. How many times had she praised Whitsun to his face. Like enough she had wanted the regulator all along, and had only taken up with Lum because Whitsun didn't speak—girls did such things Lum knew from the songs. Here was the secret of her being so quiet and sad and of that queer way she had with her that made him feel farther away, in the same room, than he did thinking of her, miles off, in the bottom.

"I never cud much her like I cud t'other gells," thought Lum; "I allus hed ter study on't afore I cud putt my arm 'reoun' her waist. Reckon I sorter s'picioned, inside, thet it pestered her. Pore Polly Ann!"

It was like Lum to feel no anger, only compassion, for his wife.

"Hit's bad fer her too—turrible bad," he pondered; "ef it's me gits killed up she caynt hev no mo' truck wi' him, an' ef it's him she'll natchally hate the sight er me! Wa'al, she won't be pestered with it; I'll go off on the cotton-boat afore sundown. All through this wide worl' I'll wandern, my love," said Lum, his thoughts unaffectedly shaping themselves in the words of his songs. They did not cause him to waver in his purpose; he knew Polly Ann's notions of manly honor too well. Old Man Gooden shot a man once.

"Paw hed ter shoot him," Polly Ann explained; "he spattd paw en the face."

"An' ef a feller spattd me, wud I hev ter shoot him?" Lum had asked, amused by her earnestness, for this was before he passed the careless stage of his marriage.

"Wudn't ye waynt fer ter shoot 'im?" said Polly Ann, fixing her beautiful grave eyes on his smiling face.

"Wa'al, I shudn't crave it," said Lum.

"But ye wud, Lum, ye *woud* shoot him!"

"Mabbe—ef I cudn't run away," answered Lum, and he had laughed at her face over that speech.

He did not laugh now, riding with his bruised throat and aching shoulders, and the gun slung across his saddle-peak.

"Him or me," groaned Lum; "hit's him or me—one! Thar ain't no tother way!"

He was riding through the bottom lands above the mill. The entire bottom was like an innocent jungle with its waving green un-

BUD BOAS.

dergrowth of cane. Pigs were rooting under the trees, and the heads of cattle rose above the cane, turning peaceful eyes of satisfied appetite upon Lum's reckless speed.

There was no reason for haste, really, outside the relief which motion gives to a perturbed soul, for Lum knew that Whitsun was buying a horse of a farmer up on the bayou, and would have to return by the same road. But he did not slacken his pace until he came on a man riding more leisurely. The man hailed him, and he saw Boas.

"W'y, I wuz at yo' heouse," said Lum, "an' Mis' Boas towed ye wuz en bed."

"So I war," said Boas in a weak, high voice, "but—I got up—I got up!"

"Toby shore, toby shore," said Lum soothingly.

He saw the man could barely keep in his saddle for trembling and that his features were ghastly; but Lum had the humblest Southerner's innate politeness; it was not deemed good manners in Clover Bend to take notice of anything singular in Boas's appearance or conduct; there was one unhappy explanation always ready.

Lum, through his daze of anguish, felt a prick of pity for this miserable being who had done many a kindness to Lum's mother in his unhaunted days. He stretched out his arm and supported Boas by the elbow.

"Oh, I'm peart enough," said Boas; "I waynter tell ye suthin', Lum."

The younger man resigned himself with inward impatience to a slower gait.

"This yere's a sightly kentry, Lum, ain't it?" said Boas, gazing about him, "but I ain't repinin' ter leave it."

"Be ye gwine ter Texas?"

"Farder'n Texas, boy. Dr. Vinson was over an' he tole me — naw, Lum, ye don' need ter say yo' sorry, I know ye ar'. Ye be'n like a son ter me sence ever ye wuz a little trick an' played with my boys. Ye wuz the least little trick er all. Ye 'member 'em, Lum, sich peart, likely boys they wuz, an' they all died up an' nary un ter home, peaceable like; Mat an' Tobe drown'd, an' Mark throwed from his hoss. All on 'em ayfter — ye know w'at — all three en one year, ev'ry chile we'd got, Ora an' me. Hit war hard ter endure, Lum, turrible hard."

"It war so," said Lum.

"Wa'al, they're all on 'em gone. An' I'll be gone, too, afore long. I ain't repinin'. Lum, ye never heerd me talk on't; I cudn't b'ar ter speak; but, somehow, 'pears like 'twud ease my min' a bit ter tell ye suthin' er my feelin's, Lum; ef I hedn't er be'n so mortal skeered er meetin' up with Grundy, I'd a killed myse'f a long spell back, I wud so. I'm wore out. Boy, ef so be yo' tempted ter fight, 'mind yo'se'f er me! I killed Grundy Wild, killed 'im fair too; but, Lord ferguv me, I done went enter thet ar fight *aimin'* ter kill. I 'low thet war how he got 'is holt on me. Fer he's never lef' me sence. Fust I wudn't guv in. 'Be thet ar all the harntin' ye kin mek out?' sez I. But hit kep' a comin' an' a comin', never no differ. tell hit crazied me, Lum!

"Nur thet warn't the wust on it. The wust war bein' skeered the hull w'ile, 'spectin' an' dreadin' never no tell.

"Did ye never hev a door a squeakin', Lum? A squeakin' door ar' a mighty little trick; 'tain't nuthin', ye may say; but ye'll be a settin' an' thet thar door'll squeak an' stop, an' then it'll squeak agin, an' then not, an' then squeak an' squeak an' squeak tell ye git up, sw'arin' mad, an' shet the door. *Lum, I cudn't shet the door!* I taken ter drinkin', but I cudn't git so drunk thet I'd not feel thet thar cole han' er his'n a flap flabbin' on my face. Hit's wore me out. At las' I jes give up; an', my Lord! 'peared like his soul fa'rly enjyed trompin' on me, r'arin' an' chargin' like twuz a wil' hog! Oh, my Lord!

"BE YE ON HIS SIDE?"

my Lord!" The man shook in his saddle with the horror of his recollections. But he controlled himself enough to go on, though the sentences came in pants. "Then I 'membered — thet thar tex' — an eye fer an eye an' a tooth fer a tooth. Hit come ter me — cud I on'y swap a life with the Lord fer Grundy's — then it mought be he wud tek Grundy offen me an' — let me die en peace. I don' ax no mo'." He stopped, gasping and coughing while Lum held him. Lum was deeply touched; he was not a whit moved from his intention; but he was touched, and he felt a somber sense of comradeship, thinking, "Mabbe I'll know how ye feel, ter-morrer." Boas continued:

"An', Lum, w'ile I war studyin' an' prayin', 'Lord, let thy pore sinful sarvint wipe the blood-guiltiniss offen his soul an' not hev ter die

skeered!" Lum, I heerd them Case boys frum the hills talkin' outside. They wuz come ter borry my bateau. They wuz ayfter Whitsun Harp, bekase he'd prommused the big un, Ike, a lickin' fer beatin' Ole Man Bryce outen 'is cotton. They waz 'lowin' ter pick a fight wi' him an' kill him. I peeked outer a crack an' seen 'em. Two hed guns, an' all three hed knives. So I tole Ora ter tell 'em we 'lowed ter use our own boat. But they got a bateau farder down, an' I seen 'em en the river, so I hed Ora row me over an' I borried Looney's hoss, it bein' so easy — an' I'm agwine ter warn 'im. The river twists so, an' thar's a right smart er groun' 'tween Young Canes whar he ar' an' the water, I kin' git thar fust, easy — Say, little tricks, w'at ye beellerin' fer?" The road had passed a little clearing, made in Arkansas fashion by burning down the trees. The cabin in the center had no window, and the door was open, showing three particularly dirty children who were all crying together. The oldest stuck a shaggy white head out to say, "Hit's fer maw?"

"Whar's yer maw done gone?"

"She's done gone 'ith Mr. Harp fer ter see Aunt Milly Thorn, kase Uncle Tobe Thorn done lick er hide offen er," said the child, evidently repeating an older tongue's story. "I sended three men ayfter er, but she ain't come back, an' we uns is hungry. Oh dear, maw! maw!"

"Hush, hush, honey," said Boas, trembling, "whar did the men come from?"

"They come from a boat, an' they axed fer Mr. Harp, an' they said they wud fotch maw back in the boat. Will ye fotch maw?"

"Ter Tobe Thorn's," screamed Boas, clutching Lum's arm; "d'ye onnerstan', Lum? Thet's 'cross the big bayou, the heouse on the bank; they kin cut 'cross en the bateau, an' the road goes 'way off t'other side. I cayn't do hit, Lum, the Lord don' mean ter parden me! An' pore Whitsun —" shaking Lum's arm in his uncontrollable agitation — "Lum, mabbe its 'tenled fer you ter save 'im! Yo' hoss never makes a blunder. Ye know the bottom, an' ye kin ride through the brake fast — fast!"

Lum turned a dull, deep red; he felt himself suffocating with passion; he saw his revenge lost, and with it everything else. Yet he could not wrench his last hope from this hunted, desperate, dying creature. And Boas had been kind to his mother.

"Lum, ye will do hit," pleaded Boas, "I know ye don' bear no good will ter Harp, but, God A'mighty, he's a human critter, ye won' see 'im murdered w'en ye kin save 'is life! Ye cayn't be so hard-hearted! Oh, Lum, do it ter save *me*, ter help *me* outen the hell I be'n en fer five year!"

"Yes," said Lum, "I'll go fer *you*, Boas."

His face was as white as Boas's, but Boas could not see; he pushed his helper by the shoulder to hurry him, panting, "Go 'long, then, fast, fer God's sake! God bless ye, boy, ye'll save two men stidden one. How he rides, an' I useter ride thet way—" The children cried, and he went to them; Lum was out of sight in the high cane.

The young fellow rode furiously. Beneath that pleasant green sea lay pronged roots and logs and ugly holes. Thorn-trees stretched out their spiked limbs, wild grape-vines flung their beautiful treacherous lassos on the breeze, and pawpaw saplings, stout enough to trip a horse, were ambushed in the cane. Through them all crashed the brave gray, leaping, dodging, beating down the cane with his broad chest, and never slackening his speed. It looked like a frantic race through the wilderness, but, with the woodman's instinct, the rider, leaving the perils below to the beast's sure eyes, was really guiding him on an invisible course.

At last Lum drew rein before another clearing. He could see Thorn's cabin and women in the "gallery," and, riding along the shore, nearer and more distinct, the figure of a man on horseback, plainly Whitsun Harp.

Lum galloped up to him.

The regulator carried pistols in the holsters of his old cavalry saddle; the barrel of one flashed out as Lum approached.

"Ye ain't no call ter be skeered er *me*!" shouted Lum. "Not *this* time. Look out fer the Case boys — thar, on the bateau! They're a comin'!"

"Shucks!" said Whitsun. He gave Lum a long and keen glance which apparently satisfied him, for he addressed himself at once to the more imperative danger. In fact, the Case boys were landing. Ike, the tallest, he to whom the "lickin'" had been promised, stood up in the boat, as the keel grated on the sand, and hailed Lum:

"Say, Lum Shinault, moosey outer yere, we hain't no gredge agin *you*!"

"W'at mought ye hev come fer then?" said Lum sarcastically.

"Ter guv thet thar — regerlater a show ter lick Ike, ef he darst," called the second brother.

"I darst," Whitsun replied with his usual composure; "jes come on over!" The brothers consulted; then Lum was hailed again:

"Lum Shinault, git outen the road!"

"The road's free," said Lum. "Yo' mighty brash orderin' folks outen the road!"

"Dad burn ye, be ye on his side?"

"Looks like," replied Lum indifferently; "onyhow, ef ye waynt a fight ye kin hev hit!"

"They all won' fight," said Whitsun.

Nor did they. The third Case boy (while

the others were bending to their oars) yelled: "A man so mean 's you, Whit Harp, hed or ter be shot 'twixt the cross er the gallowses, an' we'll do hit yit!" And the big Ike informed Lum that he was "let off" on account of the women in the cabin; but not one of them lifted his gun. Safe out in the river, they threw back a shower of threats and oaths, but nothing more solid.

"They're pusillanimous cusses," remarked Harp. Then he drew nearer Lum, looking actually embarrassed. "I cayn't mek you out rightly, nohow, Columbus Shinault," said he.

"Naw," said Lum scornfully, "nor I cayn't mek myself out. Look a yere, Whit Harp, I come enter this yere bottom ter *kill* you."

Whitsun nodded gravely, making a little affirmative noise in his throat, exactly as he might have done to a remark about the weather.

"An' I *wud* hev killed ye or be'n killed up myself—one, ef I hedn't met up with Bud Boas. 'Tain't no differ *how* he stopped me; he done hit, he sent me on his errant ter ye—ter warn ye; an' w'at's mo', so longer 's he lives ye ain't nuthin' ter fear from me. But w'en he's done gone—look out!" He would have wheeled his horse, but Harp caught the rein, saying "Stop! w'at sorter trick's all this? W'at fer did ye stop fer Bud Boas? Did he—did he skeer ye with his ghost?"

Lum laughed harshly, in sheer bitterness of soul: "A dozen ghosts wudn't a stopped me. I don' hole by ghosts nohow."

"Then w'y did ye go?"

None of us are above wishing to be justified, and there is a peculiar zest in overturning our enemies' false notions of us. Lum never would have proffered an explanation, but there may have been a grim comfort in letting Whitsun see his real self. He replied quietly, "I come ter help Boas."

"How'd thet help 'im?"

"'Kase he war purportin' ter warn ye hisself. He 'lowed ef he cud jes save some un's life—a sorter swap like fer the one he taken, thet ar ghos' w'at harnts 'im mought quit."

"Did the ghost say so?"

"I don' hole by ghosts, I tell ye. Naw, it's jes a idy. So's the ghost a idy, ter *my* min'. But hit's plum fixed in 'is head jes strong's scripter. An' I reckon t'wull be like he 'lows t'will be—so. He 'lowed ef he cuds save ye from bein' killed up er hev me, then the ghost 'ud let up an' he cud die in peace."

"Toby shore. An' hit war thet away? An' thet thar's w'y ye won' fight me—kase the life won' be saved then an' the sperrit mought cum back?"

Lum shrugged his shoulders: "I guess."

Whitsun's stolid face worked as he cried:

"Blame my skin ef I kin mek ye out onyhow! Ye ain't no sich feller like I wuz 'ceountin' ye ter be!" The blood rushed to Lum's forehead with a sudden sense of the uselessness of this late recognition, a sudden fury of pain. "Ye hev foun' hit out too late, Whitsun Harp," he cried; "ye shamed me afore Polly Ann, an' ye shamed her too, lickin' her husband jes bekase ye wuz the bigges' an' stronges', an' ye wuz too dumb ter see thet thar triflin' critter, Savannah, war jes sick with a chill, an' I wuz guvin' on her w'isky."

"An' wuz them lies 'beout you an' her?"

"Ax *her*," said Lum, overcome by irritation; "I don' want no mo' truck 'ith ye, Whit Harp, w'ile Boas is 'live. Let go!"

"Jes er minute mo', Lum. I ain't agoin' ter fight with ye ayfter this ev'nin'. An' ef I done ye wrong I'll ondo hit yit."

The hand on Lum's bridle dropped, and the gray leaped forward; Lum's farewell words hurled behind: "Ye cayn't ondo hit; all ye kin do ar' ter fight me, an' ye *shell*!"

"Ef I mistaken him," muttered Whitsun, who hardly seemed to hear, so absorbed was he in his own train of thought, "ef—how *cud* hit a be'n—me bein' called?"

Boas was waiting at the cabin. He thanked and blessed Lum, but the poor fellow's heart was too sore to be thus eased. He must go back to Polly Ann, who despised him. It never occurred to him to try to lift himself a little in his wife's opinion by telling the story of the afternoon; he felt too sure that Polly Ann would not believe in any real intention of his to fight Harp, and would think that he welcomed any excuse. If only the Case boys had fought, if somebody's blood, no matter whose, had been spilled! "Gells is allus a cravin' fer folks ter be killin' each other," mused Lum. "Polly Ann wud feel a heap pearter ef I hed a fust-rate title ter a ghost er my own. But now I never'll hev no show, not the leas' bit on earth!"

Polly Ann received him with great kindness, saying nothing of the spoiled dinner or the delayed supper and twice-made coffee. After supper she herself brought him the violin. But he put it aside, saying: "Tek hit 'way, I don' feel like fiddlin'!" He had scarcely touched his supper. "Ye feelin' puny, Lum?" said Polly Ann timidly. He only shook his head and went out, forgetting his hat. Her kindness jarred on his sick soul; this morning he had yearned for it because this morning he had a conviction that she would not despise him long or grudge him, afterward, a last caress. But now—"I'm so low down en her min' she cayn't help pityin' me," thought Lum. Degraded in his own eyes and in hers, and uncertain how long before Savannah's giddy tongue might be released from

the fear that tied it and make his humiliation the latest joke for the store, Lum's whole nature seemed to collapse. He shunned the Clover Bend people; he even shunned his wife, spending days in the woods shooting, or picking cotton, and taking a lunch into the field. At night, supper over, he would go out and be gone until late. Many a night did Polly Ann pretend to be sleeping when Lum stepped softly across the floor. He never had been drinking; and he did not cross the river, for Polly Ann, always watching at the window, could see that the boats were not moved. One night she followed him. All that he did was to wander restlessly among the hills. She saw him make wild gestures; once she heard a groan. Then she crept back to bed and cried, poor woman, whether for him or for herself, who knows?

She began to be frightened. She saw Harp at a distance, and once he crossed the river and paid a long call on Boas; so that she did not connect any possible remorse with her husband's gloom. How could she imagine that he was ceaselessly and poignantly regretting his not being a murderer?

The only place where Lum was anything like his old self was in Boas's cabin. Boas was dying, but very peacefully. The visions which had tortured his life away were gone. He had no more dread of them. Thanks to Lum, he told his wife. He told her nothing else, but that was enough to arouse her gratitude. She would not pain him with questions, but she thought no harm of questioning Polly Ann. "D'ye 'low Lum done seen Grundy an' druv him 'way?" she asked in tones of awe. "Law me, Mis' Shinault, but he mus' hev grit!" Grit?—poor Lum! But Polly Ann, who was superstitious, did have a vague and appalling theory that in some way Boas might have transferred Grundy to Lum. Yet, were she right, it was not natural for Lum to take such evident comfort in Boas's society, going there every day, and taking his violin, although he never lifted the bow at home.

Boas had little to say; what he had was about the time when his lost boys were children. He would lie for hours, quite patient, quite content, watching his wife at her simple tasks or hearing Lum play. He often smiled. It was a pathetic sight to see how this man, who had not known peace for so long, seemed actually to revel in mere immunity from dread. "'Pears like I cudn't git enough er jes restin'," he would say. He suffered very little physically. "It isn't so much that his lungs are gone," the doctor had said; "all his organs seem used up. It's more a death from exhaustion than anything else."

November passed. Early in December Boas

died. Lum saw him only a few hours before the event. He had never alluded to the past horror, but to-day he said: "Lum, I be'n havin' a cur'is dream. 'Peared like I war haulin' logs alonger Grundy Wild, like we useter. An' we uns war hevin' sich a pleasan' time. Hit war purty weather, an' we uns didn't 'pear ter hev no bad feelin's 'twixt us, an' Grundy he war a laffin' an' pokin' fun, an' me, I war laffin', too, kase ye know them tricks er his'n an' quar contraptions, an' nary un 'membered nuthin' er thet ar bad time. I war a laffin' w'en I waked up. Lum, we uns war right good frien's wunst, an' hits quar but I ar' a feelin' them ole frien'ly feelin's now agin. Hit's like the res' war jes a bad dream. I ain't skeered no mo' er meetin' up with Grundy, Lum."

Not long afterward he fell asleep, and he may have wakened with Grundy, for he did not waken in this world. There was a great gathering at the funeral. To this day the widow talks about it with doleful pride: "'Twar the vurry bigges' an' the gran'es' buryin' the Bend ever seen. A hun'erd an' sixty-two, big an' little, looked at the co'pse. I ceounted."

Whitsun Harp came to the funeral. It so happened that when Lum first saw him they were both standing at the grave. The open grave was between them. Polly Ann saw Lum's moody countenance brightened by a fierce light. Harp did not seem to see Lum or any one; his composed and melancholy gaze went past their heads over the forlorn little field with its rail fence and high gray grass waving above the unmarked mounds. The services ended, the people slowly walked down the path which their own footsteps had made through the grass. Polly Ann kept close to Lum. He edged himself up to Whitsun. They spoke together in a low tone, but Polly Ann had the ears of an Indian; she caught two fragments of Lum's sentences: "Nuthin' *now* ter hender," and "Down en th' bottom, by the little bayou."

There were people with the Shinaults as far as the ferry, and afterward there were the widow and two cousins to escort home. One of the cousins, intent on having a comfortable gossip about the dead man with some one not too near him for free discussion, returned with Lum. So she gave Polly Ann no chance to see her husband alone, and was still rocking and talking in the black and gilt rocking-chair when he came in and took down his gun. "I'm goin' fer a shoot, Polly Ann," said he. He had crossed the threshold, but he came back and kissed his wife on both cheeks, before the cousin. The cousin giggled; but Polly Ann remembered that he had not kissed her before in three weeks. I fear that her visitor found her an ungracious hostess. The instant

she was free, she ran to the shore. Lum's boat was gone, but Boas's little boat had been left near the ferry; in this she rowed over to Clover Bend. At first she hesitated on the other shore, but presently she ran at the top of her speed. She had heard a single shot. "Thar wud er be'n *two*," her white lips kept muttering; "thar wuz on'y one!"

She ran past the mill, past the pasture, down into the swamp. It was the same cypress brake through which Lum had ridden with Boas, three weeks before; but it was another scene to-day. One of the wood fires, so common in autumn, had shorn the ground of the green cane and all the undergrowth that hides the weird ugliness of the cypress roots. Now, bared of every tender disguise of vine or moss, the hideous things, in their grotesque and distorted semblance of human form, seemed demon dwarfs crouching over their fires; while the cypress knees bore an uncanny resemblance to the toes of incompletely buried giants. Out of this huddle of monstrous shapes rose the cypress-trees, unmarred by knot or branch until high, high above a rider's head, some slim and erect like stately young maidens, others of enormous girth, brother giants to those that the earth refused to cover. Some were as smooth and glossy white as dead bones. The fire had eaten out their life. Charred logs were tumbled over the ground, and the cypress boughs were ashes whence rose a cloud of smoke under hurrying feet.

Polly Ann ran on farther and farther into the ruined forest. She could see the shining of water. A log had fallen across the road. No, oh God! it was no log, it was a man, it was Whitsun Harp lying on his face, shot dead from behind.

Another woman might have screamed. Polly Ann only knelt down beside the man who had loved her all his youth, and very gently turned his face to the sun.

He who so seldom smiled now wore a pleasant, dreamy smile on his lips. The murderer had taken such sure aim that death did not even interrupt the murdered man's thought.

Then, at last, Polly Ann understood her husband. This was what he was studying.

Without a moan or cry her body swayed forward like a broken tree and fell beside Harp's. But she did not lose consciousness; she knew the voice that called her name, and she staggered to her feet. Lum was standing in the road, his face ashen-white and his gun shaking in his hands. She ran to him with a great sob and threw herself against his breast.

"Run! run!" she gasped, "they'll cotch ye! Tek the boat; the river's bes'!"

"Fer w'y must I run?" said Lum. Though he was so agitated, so excited, he seemed rather

like a man overcome by some unexpected sight of horror than one who fears for himself.

"You"—began Polly Ann; she clutched the barrel of his gun. It was cold to the touch.

"Ye hav'n't fired hit off!" screamed she.

"Naw," said Lum, "I seen ye weepin' over Whitsun Harp; ye 'low I killed him?"

"Ye looked so — skeered!"

"I war skeered — pow'ful skeered. Kase, Polly Ann, I lef' home 'ith my min' sot on killin' thet thar dead man, but I didn't do hit. Hark' ter me, afore him lyin' thet away ye don' b'lieve I cud lie. Lemme tell ye the hull truth." Then he told, with the conciseness of strong emotion, how Boas had saved him in the first place, and how, as long as Boas lived, he could not renew his attempt. "But, ter-day," said he, "I war free agin. I cud show ye I war a man's much ez Harp. I spoken ter him at the buryin'."—He shuddered.—"I 'p'inted this yere place. He tole me ter come ter the store fust, an' then ef I wanted he'd come yere. I done wen' ter the store. And *he* war thar. Afore 'em all, he stepped up an' begged my pardin'. 'Mr. Shinault knows w'at fer,' he says, an' then he thanked me fer 'savin'' on his life — he putt hit like thet — an' tole the hull story. 'An' now,' sezee, 'I don't guess ye keer fer my comp'ny down en the bottom.' Then he holes out his han', an' I taken it, an' he said, 'Ye won' keep no gredge agin me no mo', will ye, you nor yo' wife?' an' I said 'Naw,' an' he went away, an' I never seen him agin tell I seen *you* settin' by him, an' him dead. Polly Ann, ye *do* b'lieve me."

Polly Ann was sobbing, but she nodded. "Abe Davis, he war with me, but he went on the high road, an' I come down yere fer a shoot, so I'd hev some squirrels to tote home. We heerd the shoot, but folks is allus shootin' in the bottom. We mought er cotched of 'em ef we'd come straight down: I don't guess they'll ever cotch 'em now. Thar's too many ter s'picion."

Lum judged rightly. Among the dozen men who had cause to hate Whitsun, Justice (a somewhat unwieldy personage in the bottom) never could find enough evidence against any one to take action. Whitsun's murderer was never punished, to Clover Bend's knowing; he was never even pursued.

Lum knelt down as Polly Ann had done by the dead man's side; he looked up at his wife with love and pity beyond his expression. "Yes, he's done gone shore, dearie," he said slowly; "I wisht he warn't. He war a better man nor me."

Polly Ann only sobbed.

"Wud ye — wud ye like ter — ter say good-bye ter him afore I holler on Tobe? I'll step over yander ter look fer 'im."

"LUM KNELT DOWN AS POLLY ANN HAD DONE."

Then Polly Ann looked up. She read his thoughts.

"Lum," said she, "come yere!" He came.

"Ye 'low thet I set store by Whitsun, too gre't store, mor'n I done by *you*?"

"He war yo' kin', honey, I don' meanter ter trow it up agin' ye—ye 'lowed I war tridin'."

"Lum, Lum, don' say the word," cried she, "*don't!*" I don' know how ter tell ye; but 'twaz *you* allus, allus, even w'en ye hedn't nary thought fer me an' wuz waitin' on Savannah Lady. I fit agin' hit, I done my bes' ter brung my min' ter Whitsun, fer he—he axed me an' he war so good, so brave, the bes' an' faith-fulles'—but I cudn't do it, kase my min' war

so sot on you. An' then we uns wuz married, an' ye didn't set no gre't store by me fer a right smart. An' I wuz so lonesome, an' paw war gone, an' I grieved. An' then w'en ye sorter—sorter began ter hev a—a differ en yo' feelin's I war frettin' an' takin' on bekase ye warn't like Whitsun, an' kase ye wud let 'im dare ye an' prommus ye lickin's an' not tek it up. Oh Lum, I war a fool, but 'twar allus you. *Whitsun* knows it war allus you."

"Yes, honey, yes, my darlin', I onnerstan'," said Lum softly, gathering her into his arms with a full heart. In that supreme moment they both forgot all the world but themselves.

But Whitsun, lying in the sunlight at their feet, was smiling still.

Octave Thanet.

ISRAEL.

WHEN by Jabbok the patriarch waited
To learn on the morrow his doom,
And his dubious spirit debated
In darkness and silence and gloom,
There descended a Being with whom
He wrestled in agony sore,
With striving of heart and of brawn,
And not for an instant forbore
Till the East gave a threat of the dawn;
And then, as the Awful One blessed him,
To his lips and his spirit there came,
Compelled by the doubts that oppressed him,
The cry that through questioning ages
Has been wrung from the hinds and the sages,
“Tell me, I pray Thee, Thy Name!”

Most fatal, most futile of questions!
Wherever the heart of man beats,
In the spirit's most sacred retreats,
It comes with its somber suggestions,
Unanswered forever and aye.
The blessing may come and may stay,
For the wrestler's heroic endeavor,
But the question, unheeded forever,
Dies out in the broadening day.

In the ages before our traditions,
By the altars of dark superstitions,
The imperious question has come;
When the death-stricken victim lay sobbing
At the feet of his slayer and priest,
And his heart was laid smoking and throbbing
To the sound of the cymbal and drum
On the steps of the high Teocallis;
When the delicate Greek at his feast
Poured forth the red wine from his chalice
With mocking and cynical prayer;

When by Nile, Egypt worshipping lay
 And afar, through the rosy, flushed air
 The Memnon called out to the day;
 Where the Muezzin's cry floats from his spire;
 In the vaulted Cathedral's dim shades,
 Where the crushed hearts of thousands aspire
 Through art's highest miracles higher,
 This question of questions invades
 Each heart bowed in worship or shame;
 In the air where the censers are swinging
 A voice, going up with the singing,
 Cries, "Tell me, I pray Thee, Thy Name!"

No answer came back, not a word,
 To the patriarch there by the ford;
 No answer has come through the ages
 To the poets, the seers, and the sages,
 Who have sought in the secrets of science
 The name and the nature of God,
 Whether cursing in desperate defiance
 Or kissing his absolute rod—
 But the answer which was and shall be,
 "My name! nay, what is it to thee?"
 The search and the question are vain.
 By use of the strength that is in you,
 By wrestling of soul and of sinew
 The blessing of God you may gain.
 There are lights in the far-gleaming heaven
 That never will shine on our eyes,
 To mortals 'twill never be given,
 To range those inviolate skies.
 The mind whether praying or scorning
 That tempts those dread secrets shall fail,
 But strive through the night till the morning
 And mightily shalt thou prevail.

John Hay.

THE CAMPAIGN FOR CHATTANOOGA.

FUGITIVE NEGROES.

AS a duty to the living and to the dead, I avail myself of the opportunity here afforded to perpetuate testimony concerning the strategy and grand tactics of that wonderful campaign of Chat-

tanooga in which the battle of Chickamauga was an inevitable incident. In the performance of this peculiar duty, it is a relief to know that, thanks to Congress and to Colonel R. N. Scott, the publication of reports, correspondence, orders, and dispatches relating to these events will soon be made in a forthcoming volume of the "Records of Union and Confederate Armies during the Rebellion," which will enable an interested public to verify the accuracy of what I shall state.*

On October 30th, 1862, at Bowling Green, Kentucky, I assumed command of the troops which had been under the able and conscientious Major-General D. C. Buell. They consisted of the Fourteenth Army Corps and such reinforcements as had joined it previous to the battle of Perryville, Kentucky, which drove the Confederates advancing under Bragg, back into Tennessee. There were, in all, 10 divisions of infantry, about 34 batteries of artillery, and some 18 regiments of gallant but untrained cavalry.

The Army of the Cumberland was molded out of these by organizing the infantry and artillery into grand divisions: the right under Major-General A. McD. McCook; the center under Major-General George H. Thomas; and the left under Major-General Thomas L. Crittenden. The cavalry was under General D. S. Stanley, an experienced chief. There was a pioneer brigade, formed by details from the infantry, under the chief engineer, and inspector general's and topographical staffs for corps, division, and brigade service, detailed from officers of the line. Through interchanges, the muskets of each brigade were reduced to a single caliber; and battle-flags were prescribed to distinguish corps, divisions, and brigades on the battle-field and march.

With this army, under instructions from

* Colonel Robert N. Scott died on March 5th of pneumonia. He had been ill only a week. In 1878 he was assigned to the duty of compiling the records of the war, which he performed with signal ability and

Major-General Halleck, General-in-Chief, I was to "Go to East Tennessee, driving the rebels out of Middle Tennessee."

It was November. The autumn rains were near at hand. East Tennessee was 150 miles away, over the Cumberland Mountains. It had been stripped of army supplies by the Confederates. We had not wagons enough to haul supplies to subsist our troops fifty miles from their depots, as had just been demonstrated in their pursuit of Bragg, after Perryville. Hence our route to East Tennessee must be by the Nashville and Chattanooga Railroad, or within less than fifty miles right or left of it. The shortest and best line lies through that gap in the mountains where all the drainage of East Tennessee breaks through and flows westward from Chattanooga, forty miles by river, into Middle Tennessee at Bridgeport. [See map, page 133].

In the first week of November the Army of the Cumberland, therefore, proceeded to Nashville, and as soon as it was prepared to do so, Dec. 26th, began its movement for Chattanooga, distant 151 miles. Meanwhile, the enemy under Bragg concentrated at Murfreesboro', 32 miles from Nashville. The opposing armies met on the bloody field of Stone's River, December 30th, and after a contest of four days, in which twenty per cent. of its brave officers and men were killed and wounded, the Army of the Cumberland took Murfreesboro'.

The Confederates retired to Duck River, 32 miles south, and established a formidable intrenched camp across the roads leading southward at Shelbyville. Another intrenched camp was constructed by Bragg 18 miles south of Shelbyville at Tullahoma, where the McMinnville branch intersects the main Nashville and Chattanooga Railroad.

The winter rains made the country roads impassable for large military operations. Our adversary's cavalry outnumbered ours nearly three to one. It occupied the corn regions of Duck and Elk rivers. Ours had to live in regions exhausted of supplies, to watch and guard the line of the railroad which supplied us — 32 miles to Nashville, and the Louisville and Nashville Railway for 185 miles farther northward to Louisville. We lost many of our animals for want of long forage. Mean-

impartiality. His loss will be keenly felt by students of war history who, like ourselves, have had the benefit of his scholarly counsel and unfailing courtesy.—
EDITOR.

while we hardened our cavalry, drilled our infantry, fortified Nashville and Murfreesboro' for secondary depots, and arranged our plans for the coming campaign upon the opening of the roads, which were expected to be good by the 1st of May, 1863.

General Burnside, commanding the Department of the Ohio, including Ohio, Indiana, and Kentucky (with headquarters at Cincinnati), sent his next in command, Major-General George L. Hartsuff, to arrange for his forces to coöperate with ours for the relief of East Tennessee, which, though largely Union in sentiment, was now occupied by the enemy under General Buckner.

I explained to Hartsuff my plan, the details of which I gave to no other. It was briefly:

First. We must follow the line of the Nashville and Chattanooga Railway.

Second. We must surprise and manœuvre Bragg out of his intrenched camps by moving over routes east of him to seize the line of the Nashville and Chattanooga Railway in his rear; beat him if he fights, and follow and damage him as best we can, until we see him across the Tennessee.

Third. We must deceive him as to the point of our crossing the Tennessee, and securely establish ourselves on the south side.

Fourth. We must then manœuvre him out of Chattanooga, get between him and that point, and fight him, if possible, on ground of our own choosing, and if not, upon such ground as we can.

Fifth. Burnside must follow and guard the left flank of our movement, especially when we get into the mountains. His entrance into East Tennessee will lead Bragg's attention to Chattanooga and northward, while we cross below that point.

Sixth. Since our forces in rear of Vicksburg would be endangered by General Joseph E. Johnston, if he should have enough troops, we must not drive Bragg out of Middle Tennessee until it shall be too late for his command to reënforce Johnston's.

Bragg's army is now, apparently, holding this army in check. It is the most important service he can render to his cause. The Confederate authorities know it. They will not order, nor will Bragg venture to send away any substantial detachments. In fact, he is now holding us here by his nose, which he has inserted between our teeth for that purpose. We shall keep our teeth closed on his nose by our attitude, until we are assured that Vicksburg is within three weeks of its fall.

General Hartsuff reported this to Burnside, and advised me of their assent to the plan and to concurrent action.

The news that Vicksburg could not hold

out over two or three weeks having reached us, we began our movements to dislodge Bragg from his intrenched camp on the 24th of June, 1863. It rained for seventeen consecutive days. The roads were so bad that it required four days for Crittenden's corps to march seventeen miles. Yet, on the 4th of July, we had possession of both the enemy's intrenched camps, and by the 7th, Bragg's army was in full retreat over the Cumberland Mountains into Sequatchie valley, whence he proceeded to Chattanooga, leaving us in full possession of Middle Tennessee and of the damaged Nashville and Chattanooga Railway, with my headquarters at Winchester, fifty miles from our starting-point, Murfreesboro'. This movement was accomplished in fifteen days, and with a loss of only 586 killed and wounded.

From Winchester by railroad to Chattanooga is about sixty-nine miles. By wagon roads it is much greater. To pass over this distance, greater than from the Rappahannock to Richmond, Virginia, with intervening obstacles far more formidable, was our greatest work. In front of us were the Cumberland Mountains. Beyond them was the broad Tennessee River, from 400 to 900 yards wide. On the north side of it, beyond the Cumberland Mountains, lay Sequatchie valley, 3 or 4 miles wide and 60 miles long. East of that, Waldron's Ridge, the eastern half of the Southern Appalachian range, cut from the Cumberlands by the Sequatchie. At the eastern base of this ridge flows the Tennessee above Chattanooga, from 400 to 600 yards wide. On the south of the Tennessee tower the cliffs of Sand Mountain, 600 or 700 feet high. Beyond that broad, flat, wooded top is Trenton valley, 40 or 50 miles long, ascending southerly to the top of the plateau; and east of it the long frowning cliffs of Lookout Mountain, a thousand feet above this valley, stretch northward to the gap at Chattanooga with not a single road of ascent for 26 miles, and not another until Valley Head, 40 miles southward from Chattanooga.

The task before us was:

First. To convince General Bragg, a wary and experienced officer, that we would cross the Tennessee at some point far above Chattanooga. This required time and serious movements.

Second. Meanwhile, without attracting his attention, to repair the Nashville and Chattanooga Railway to Bridgeport on the Tennessee.

Third. To subsist our troops and accumulate twenty days' rations at Stevenson, without allowing him to get the faintest intimation of our intentions and doings.

Fourth. To construct a large pontoon bridge train, bring it and the pioneer brigade for-

ward by rail to the vicinity of Stevenson, wholly concealed from the enemy's knowledge, and have the men trained to lay and take up bridging.

Fifth. Our movement must be delayed until the new corn is fit for horse-feed; because when we cross the river and go into the mountains, our trains must carry twenty days' rations and ammunition enough for two great battles. We have not trains to carry anything beyond this, and hence feed for our animals must be obtained from the coming corn crop of the country into which we are going, or our campaign will be a failure.

Sixth. When we cross the Tennessee, we must so move as to endanger Bragg's communications by rail and oblige him, for their protection, to fall back far enough to give us time and space to concentrate between him and Chattanooga and, if possible, to choose our own battle-ground; for doubtless he will fight us with all the force he can assemble.

How all this was done we have not space to tell. Nor can we relate how it came to pass that the Army of the Cumberland had to proceed on its perilous mission alone, unaided, unassisted, either by our Army of the Tennessee, unemployed since the surrender of Vicksburg, or by the activity of the Army of the Potomac, which might have kept Lee from sending Longstreet to fight us; or by the Department of the Gulf, which, instead of threatening the enemy's Gulf coast to keep troops from going to Bragg, by a useless expedition to Texas, had given bonds, so to speak, not to molest them; or by Burnside's command, which was so far away to the north of us that, in the hour of need, with forty thousand men of all arms, he could do nothing to help us.

I only repeat that we were ordered forward alone, regardless alike of the counsels of commanders, the clamors of the press, the principles of military art and science, and the interests of our country. Of all this the corps commanders of the Army of the Cumberland and myself were well aware. They knew that the Secretary of War, without reason or justice, was implacably hostile to me. They knew more. They knew that those great loyal governors, Curtin of Pennsylvania, Andrew of Massachusetts, and Yates of Illinois, offered seven regiments of two-years' veterans, who were willing to reenlist on condition that they should go as mounted infantry to the Army of the Cumberland; that General Lovell H. Rousseau bore a letter to Secretary Stanton, explaining how very important would be the services of such a body of men in guarding the long and exposed line of our communications, soon to be lengthened by our advance to Chattanooga; that this line *must* be guarded; that

every such mounted man in that move would give us three infantry men at the front. They knew that when the Secretary had read my letter, he rudely said to General Rousseau: "I would rather you would come to ask the command of the Army of the Cumberland, than to ask reinforcements for General Rosecrans. He shall not have another d——d man."

On the 4th of August, General Halleck telegraphed me:

"Your forces must move forward without further delay. You will daily report the movement of each corps till you cross the Tennessee."

On the 6th, after full consideration and consultation with my corps commanders, I replied:

"My arrangements for beginning a continuous movement will be completed, and the execution begun, by Monday next. . . . It is necessary to have our means of crossing the river completed and our supplies provided to cross sixty miles of mountain, and sustain ourselves during the operations of crossing and fighting, before we move. To obey your order literally would be to put our troops at once into the mountains on narrow and difficult roads destitute of pasture and forage and short of water, where they would not be able to manœuvre as exigencies may demand, and would certainly cause ultimate delay and probably disaster. If, therefore, the movement which I propose cannot be regarded as obedience to your order, I respectfully request a modification of it, or to be relieved from the command."

The War Department did not think it prudent to relieve me, and therefore gave consent in terms sufficient to convict it of reckless ignorance, or worse.

But we were soldiers. We moved to our work with every energy bent on insuring its success. On the 10th of August our movement began. On the 14th all our corps were crossing the Cumberlands. It required six or seven days. The movement appeared as if directed toward Knoxville, but it was really to concentrate near Bridgeport and Stevenson. Crittenden crossed the Cumberlands into Sequatchie valley and made a bivouac many miles long; sent Van Cleve's division with our left wing cavalry to Pikeville; ordered two infantry brigades to cross Waldron's Ridge by roads some miles apart, and to bivouac in long lines on its eastern edge, in sight of observers from the opposite side of the river, who would take them for strong advances of heavy columns of troops of all arms. This appearance was confirmed by the boldness of our cavalry and mounted infantry, which descended into the valley of the Tennessee and drove everything across to the enemy's side of the river. The other corps were concealed in the forests north and west of Stevenson.

The pontoon bridge train came down from Nashville by rail on the 24th of August, and the pioneers took it away out of observation,

practiced laying and taking up pontoon bridges until the 29th, when they laid a bridge across the Tennessee at Caperton's, ten miles below Bridgeport, in four and a half hours. It was 1254 feet long, and the work was done at the rate of 4.6 feet per minute.

Meanwhile, to prepare for sustaining our army at Chattanooga, I contracted with great railway bridge-building firms to rebuild the railway bridge at Bridgeport, over 2700 feet long, in four weeks, and the Running Water Bridge, three spans, 171 feet each, to be done within two weeks thereafter; and ordered Captain Edwards, Assistant Quartermaster, to have constructed, with all dispatch, five flat-bottomed stern-wheel steamboats of light draft, to run on the Tennessee between Bridgeport and Chattanooga.

Our first bridge was ready, August 29th, and the Twentieth Corps was ordered across it to Valley Head, the south end of Trenton valley, forty miles south of Chattanooga. Thence a road leads down the eastern slopes of Lookout, by Alpine, into Broomtown valley, whence there are roads toward the Northern Georgia railway line and to Rome. This heavy corps of all arms, so far south of Bragg's position at Chattanooga, made him uneasy. But when Thomas, after crossing, moved with his corps up Trenton valley in the same direction, with all his train, Bragg became still more anxious. Then came Crittenden following Thomas with merely an unostentatious column in observation on the direct road to Chattanooga. This movement portended mischief and it was strong enough to do plenty of it. As a prudent commander, Bragg could not afford to leave us forty miles south of his position, to get quietly down and concentrate between him and Atlanta.

Bragg was reluctant to leave his stronghold Chattanooga, and yet he yielded to his apprehensions. On the 8th he slowly retired southward, giving out rumors that he would go back to Rome or to Atlanta. On Sept. 9th Crittenden's leading division entered Chattanooga. On the afternoon of the same day our cavalry and infantry, from the north side of the river, crossed over into town. The cavalry moved out to see if the enemy had gone. He was beyond Rossville and behind Missionary Ridge, but not far away. To keep up Bragg's apprehensions, McCook was ordered, without exposing his command, to appear advancing. On the 12th Thomas crossed over Lookout, up Johnson's Pass and down Cooper's, putting his command in snug defensive position at its foot. Crittenden had moved his whole corps into Chattanooga over the road at the north end of Lookout, but was ordered not to push out into danger. On the 10th the story of

Bragg's retreat to Atlanta was found to be false, and, behind our cavalry and mounted infantry, Crittenden's infantry moved cautiously out.

By the 12th, I found that the enemy was concentrating behind Pigeon Mountain near Lafayette. When Crittenden's reconnaissance in force, of the 12th and 13th, showed the rear of Bragg's retiring columns near the Chickamauga, I instantly ordered him to move westward within supporting distance of Thomas as speedily and secretly as possible. At the same time orders were dispatched to McCook to join Thomas at the foot of Cooper's Gap with the utmost celerity.*

Our fate now depended, first upon prompt concentration, and next, on our choosing our own battle-ground, where our flanks would be protected and where we could have full use of our artillery. Everything indicated that the enemy must soon attack us. Bragg issued his order for it, dated September 16th, 1863, in which he says to his command, "You have been amply reënforced." Yes! The Confederate authorities had wisely given Bragg every man they thought it possible to spare, from Virginia, Florida, Georgia, Alabama, and Mississippi. Even the prisoners paroled at Vicksburg contributed to strengthen him.

Our command received none from our authorities, who had abundant force at their disposition. About the 10th of September, aroused by fear of consequences, General Halleck began telegraphing orders for reënforcements, but we were involved in the mountains and beyond reach, and it was entirely too late for any useful results; but it was a confession that support ought to have been ordered at the proper time, and might serve for ulterior operations after our fate was decided.

At last, on the 18th, McCook's corps came within reach of the enemy, who was then moving through the gaps in the Pigeon Mountain to attack us. Over the tree-tops we saw clouds of dust moving toward our left. Bragg wanted to get between us and Chattanooga. We had no time to lose.

The whole Twentieth Corps came down the mountain, and Thomas, with three of his divisions, was ordered to move north-eastward through the forests by lines of fires, until his command was placed across the Reed's Bridge road and the more westwardly roads leading to Chattanooga *via* Rossville. Crittenden and McCook were to follow when the enemy's plan developed.

Eight o'clock on the morning of September 19th found Thomas and his wearied men in

* For additional maps and pictures relating to the battles of Chickamauga and Chattanooga, see *The CENTURY MAGAZINE* for April, 1887.—EDITOR.

position. Before the fighting began. Crittenden, with Palmer and Van Cleve, moved on the Lafayette road toward Thomas's right. The enemy soon abandoned his attempts on our left, and concentrated toward our center. Johnson's division was ordered from McCook to Thomas; Van Cleve was driven, and Davis's division gave ground. General Negley was sent to Van Cleve's position at 5 P. M., and Sheridan earlier to help Davis. The fight raged. The enemy went back and the day closed. The corps commanders came to my headquarters. They said they had fought superior numbers. They were cool, experienced commanders; they had been in many bloody battles; their opinions had great weight. I saw that the morrow was likely to be more bloody and decisive than that day. I determined the new line, so that there should be the least possible moving of the tired troops, and that it should be short enough to give us seven brigades in reserve. All but one had been in action that day. Thomas must hold the left to the last extremity. If beaten, he must retire on Rossville and Chattanooga. He must send his trains there at once. He had the four divisions of his own corps (the Fourteenth), Johnson's from the Twentieth and Palmer's from the Twenty-first Corps. Granger, with three brigades of the Reserve Corps, was in rear of his left at Rossville. This was all of our whole army on the field, save ten brigades. But the defense of our left was the defense of our army and of Chattanooga. On the 20th, short-

ly after daylight, I examined Thomas's whole line, and at 6 o'clock he wrote that he would like to have his right division (Negley's) to place on his extreme left. I ordered General Crittenden to send General Wood to replace Negley in the line. At 9 o'clock I found Wood in line of battle half a mile in rear of Negley. He said that he had understood that his order was to *support* Negley, not to *relieve* him, and proceeded to do what should have been done at least a half hour before. Meanwhile the battle had begun on Thomas's left. It moved toward the right. Heavier and heavier rolled the musketry and thundered the cannon. Captain Willard came from Thomas and asked for Negley. He had been waiting to be relieved, but now, at last, he went filing out of the woods by his left. Van Cleve was ordered farther to the north-east; McCook had had the most repeated and emphatic orders to keep his troops closing to the left.

At 11 o'clock, Major Kellogg came from Thomas, who wished to know if he could have Brannan. I replied: "Yes; tell him to dispose of Brannan, who has only one brigade in line, and to hold his position, and we will reënforce him, if need be, with all the right"; and said to Major Bond, of my staff, "If Brannan goes out, Wood must fill his place. Write him that the commanding general directs him to close to the left on Reynolds and support him."

Major Kellogg went to Brannan and gave him the order to move his command toward the left.

Brannan's skirmishers being driven in at this time, he consulted Reynolds, who said: "Under the circumstances, stay and send General Thomas word you are being attacked, and ask him if, under such circumstances, you shall leave." To this message General Thomas replied: "No, by no means."

When an orderly handed Wood his order "to close on Reynolds and support him," his skirmishers, on Opdycke's front, were being driven. Without seeking explanations from Brannan or Reynolds, and without notifying me (I was in the open field not 600 yards from him), he drew his command out of the line. Jeff. C. Davis, under orders to keep closed to the left, moved in to fill Wood's place, and his two brigades were struck by Longstreet, who, with a column "brigade front" and five lines deep, assaulted that part of the line and drove it out of place. Sheridan's three brigades were ordered to the break, but had only force enough to break a line or two, and were obliged to withdraw.

Watching the unavailing effort of Sheridan to stem the tide, I observed the long line of Longstreet's wing coming from the south-east in line of battle, outreaching our right by at least a half mile. I ordered Davis and Sheridan to fall back northward and rally on the Dry valley road at the first good point for defense, leaving most of my staff to aid in rallying these troops; and with my chief-of-staff, senior aide, and a few orderlies proceeded over toward the rear of our center, directing such of Van Cleve's broken rear of column as I met to join Sheridan on the Dry valley road. In view of all the interests at stake, I decided what must be done. Halting at a road coming from the west and leading eastward toward the rear of our left, I said to General Garfield and Major Bond: "By the sound of the battle over to the south-east, we hold our ground. Our greatest danger is, that Longstreet will follow us up on the Dry valley road over yonder to the west of us. Post, with all of our commissary stores, except those of the Twenty-first Corps, is over that ridge, not more than two or three miles from the Dry valley road. If Longstreet advances and finds that out, he may capture them. This would be fatal to us. If he comes this way he will turn the rear of our left, seize the gap at Rossville, and disperse us. To provide against what may happen:—

"*First.* Sheridan and Davis must have renewed orders to resist the enemy's advance on the Dry valley road;

"*Second.* Post must be ordered to push all our commissary trains into Chattanooga and securely park them there;

"*Third.* Orders must go to Mitchell to ex-

tend his cavalry line obliquely across that ridge, connect with the right of Sheridan's position on this valley, and cover Post's trains from the enemy until they are out of danger;

"*Fourth.* Orders must go to Spears's brigade, now arrived near there, to take possession of the Rolling-mill bridge across Chattanooga Creek, put it in good order, hold it until Post arrives with his trains, then turn the bridge over to him, and march out on the Rossville road and await orders;

"*Fifth.* Wagner in Chattanooga must have orders to park our reserve artillery defensively, guard our pontoon bridge across the Tennessee, north of the town, and have his men under arms ready to move as may be required;

"*Sixth.* General Thomas must be seen as to the condition of the battle and be informed of these dispositions.

"General Garfield, can you not give these orders?" I asked. Garfield answered: "General, there are so many of them, I fear I might make some mistake; but I can go to General Thomas for you, see how things are, tell him what you will do, and report to you." "Very well. I will take Major Bond and give the orders myself. I will be in Chattanooga as soon as possible. The telegraph line reaches Rossville, and we have an office there. Go by Sheridan and Davis and tell them what I wish, then go to Thomas and telegraph me the situation."

I dispatched my orders, by messenger, to Mitchell and Post, gave them in person to Spears and Wagner, and awaited Garfield's report, which, dated 3.45 P. M. from the battlefield, reached me at 5 P. M., saying: "We are intact after terrific fighting, getting short of ammunition, and the enemy is going to assault our lines once more. Our troops are in good spirits and fighting splendidly."

I ordered Garfield by dispatch to tell Thomas to use his discretion at the close of the fight whether to stop on the ground he occupied or to retire on Rossville, and said that I would send ammunition and troops accordingly. Thomas used that discretion and retired to Rossville, where our troops halted, and, in spite of their condition, wearied with three days and a night of marching and fighting, were by 11 o'clock in fair defensive position. I ordered up ammunition and rations. On the next morning, Monday, the 21st, our lines at Rossville were rectified, and advantageous positions were taken to receive the enemy if he desired to attack us.

After reconnoitering a few points, he found us there and desisted from further efforts. We were now concentrated between the enemy and Chattanooga, with ammunition to fight another battle. During the day I selected the defensive lines our command would occupy

CHATTANOOGA FROM THE NORTH SIDE OF THE TENNESSEE — LOOKOUT MOUNTAIN IN THE DISTANCE; CAMERON HILL NEAR THE RIVER. (FROM A WAR-TIME PHOTOGRAPH BY LINN.)

around Chattanooga, directed the manner of retiring from Rossville and of taking positions on these lines, to which the heads of columns were guided by staff and engineer officers. The troops began quietly to withdraw at 10 o'clock P. M., and on Tuesday morning, September 22d, they were intrenching the lines for holding permanent possession of the objective point of our campaign.

It will be remembered that we started for Chattanooga from Murfreesboro', on the 24th of June, 1863. The direct distance by rail is 119 miles. To the battle-ground of Chickamauga is 20 miles farther, or 139 miles. We dislodged our adversary from two strongly fortified camps; crossed the Cumberland Mountains, the Tennessee River, Sand Mountain and Lookout Mountain; fought the battle of Chickamauga; and on the 22d of September, just ninety-two days from starting, we held Chattanooga, for the possession of which at any time within the previous two years we would willingly have paid all that it had cost.

In a note to Halleck, dated from the Executive Mansion, September 21st, 1863, President Lincoln, speaking of this possession, says:

"If held, with Cleveland inclusive, it keeps all Tennessee clear of the enemy and breaks one of his most important railroad lines. To prevent these consequences, so vital to his cause that he cannot give up the effort to dislodge us from the position thus bringing him to us, and saving us the labor, expense, and hazard of going further to find him, and giving us the advantage of choosing our own ground and preparing it to fight him upon. The details must, of course, be left to General Rosecrans, while we furnish him the means to the utmost of our ability. . . . If he can only maintain the position, without more, the rebellion can only eke out a short and feeble existence, as an animal may sometimes with a thorn in his vitals."

In presence of the facts I have just stated, and in view of all their marchings, combats, and bloody battles to get possession of Chattanooga, can the reader be made to believe that the Army of the Cumberland and its commander were likely to abandon or fail to hold it?*

W. S. Rosecrans.

* The records will show [but without data by which might be estimated the relative strength of regiment. —Ed.] that at the battle of Chickamauga Bragg had 124 regiments and 20 battalions of infantry, 34 regiments of cavalry, 47 batteries of artillery; and that we had only 133 regiments of infantry, 18 regiments of cavalry, and 35½ batteries.

Confederate maps of the battle show the enemy's line of battle on the morning of the 20th of September: Front line, 6,880 yards long; second line, 3,310 yards long. Our front line, 3,400 yards long; second line, 1,750 yards long. (Granger's three brigades, three miles away, not included.)—W. S. R.

A SHELL AT HEADQUARTERS.

THE ARMY OF THE CUMBERLAND AT CHATTANOOGA.

ON the night of September 20th, 1863, after two days of furious fighting, and after a loss of 16,179 men, nearly one-third its strength, the Army of the Cumberland withdrew from Chickamauga to Rossville, not quite four miles in the rear, and there stood in line of battle all the next day. But an attack was not made. The enemy had dashed against the "Rock of Chickamauga," and had been broken in pieces. Two-fifths of the men of Bragg's army had been killed or wounded. Rossville was held till the night of the 21st, when the Army of the Cumberland withdrew to positions in and around Chattanooga. The non-combatants of the town, in great alarm, had taken flight to the hills across the river, or had sought in their cellars refuge from the danger of an impending battle. Every church, public building, and available house had been taken for hospital purposes, for our wounded soldiers filled the town, more than nine thousand having been brought in from Chickamauga.

As soon as the divisions were in the positions assigned to them, the muskets were stacked and ax, pick, and spade were grasped. Day and night the work of fortification went on; trees were felled, houses were torn down, trenches were dug, epaulements for batteries rose from the ground in a single night, and the hills within our line grew into strong breastworks and impregnable fortresses. Looking from the signal station on Lookout Mountain down into the valley two thousand feet below, one could see myriads of boys in blue, like great ants, burrowing in the ground and throwing up hills of dirt. As Rosecrans, with his staff, rode along the lines, his troops greeted him with cheers that proclaimed the spirit of victors. Off to the south, Bragg's army could be seen, swarming through Rossville gap, and spreading over Missionary Ridge and the

east side of Lookout Mountain, and afterwards approaching our front in solid lines of battle. Batteries of artillery hurried into position; staff officers galloped over the field farther up the valley, and, in the direction of Rossville, great clouds of dust, like the "pillar of cloud by day," marked the advance of other unseen masses of troops.

Bragg's army was on its feet again, and another battle seemed imminent. Late that day General Bragg sent General Gracie to Rosecrans requesting an exchange of prisoners. In a conversation with Major Bond, aide-de-camp to General Rosecrans, General Gracie asked him what opinion prevailed among our men as to which army had the advantage in the operations that ended in the battle of Chickamauga and the occupation of Chattanooga, saying that this was a mooted question in Bragg's camp. Major Bond replied that there had been no time in the past two years that we would not have given for the possession of Chattanooga all that it had cost, and he added, "I believe we have got it." After a pause General Gracie remarked, "Well, that is so."

As the flag of truce that came with this message approached our lines, all who saw it believed that it brought a demand from Bragg for the surrender of Chattanooga. A rumor that the demand had been made and refused quickly spread through our camp, and all the troops now eagerly waited for the opening gun of Bragg's attack. But the battle was not to be. Bragg, having drawn his lines as close around Chattanooga as seemed prudent, sat down with his army, and began working with the spade not less energetically than the Army of the Cumberland. For many days, within the range of each other's artillery, the two armies dug as though each was preparing the

grave of the other. After it became apparent that Bragg would not fight at Chattanooga, it was thought that he might cross the river above, threaten our lines of communication with the rear, and thus repeat, on the north side, the manœuvre of Rosecrans. Longstreet advised such a movement; Bragg did not approve it, preferring to adopt the plan of starving us out.

On September 24th a brigade that had held the point of Lookout Mountain was withdrawn. Bragg at once took possession, and sent Longstreet's corps over into Lookout valley. He also extended his pickets down the south bank of the river, nearly to Bridgeport, our base of supplies. This cut us off from the river and the roads on its north and south banks, and left us but one open road to the rear,—if the sixty miles of unused way over Waldron's Ridge and through Sequatchie valley could be called a road, inasmuch as in places it was only the bed of winter torrents, or slashes on the mountain sides. Over this, for a time, we might haul supplies; but we were in a state of semi-siege.

Within a few days the trees within our lines had been cut down for use in the fortifications, or for fuel, and even the arbors that had been put up to protect officers and men from the sickening heat of a September sun were sacrificed for fuel. Coffee had to be boiled, though its drinkers broiled. There had been but little rain since early in July. The earth was parched and blistered. Leaves had dried up on the trees, and all grass had withered and turned gray. The moving of men and animals stirred up blinding clouds of dust which every breeze sent whirling through the camps. The troops were longing for rain, the chaplains were praying for it. With the first week in October the rains came, and it was a question whether the deep and sticky mud was not more objectionable than the dust.

The hilly, barren country north of the river—the only country we could reach—could not furnish supplies enough for the poverty-stricken inhabitants the war had left. Our whole army was therefore obliged to depend for every ration and every pound of forage on the mules that hauled the army wagons over the sixty miles of horrible road from Bridgeport. On its line some of the hills were so steep that a heavy army wagon was almost a load going up, and, now that the rains were falling, that part of it in the little valleys had become so soft and cut up that a lightly loaded wagon would sink up to the axles. In one instance, a wagon having sunk till its bed rested on the mud, the driver did not, as usual, beat his mules and swear; he simply sat on a rock by the wayside, looked at the wretched animals, and *cried*.

In the third week of the occupation of Chattanooga, no one, from commanding general down, any longer expected or even thought of an attack. Both armies had almost ceased their excavations. Missionary Ridge, summit, side, and base, was furrowed with rifle-pits and studded with batteries. The little valley of Chattanooga was dammed up with earthworks, and Lookout Mountain, now a mighty fortress, lifted to the low-hanging clouds its threatening head, crowned with siege guns. Since the 5th of October the guns of Missionary Ridge had been daily growling and barking at our forts on the left, while great shells came tumbling down from Lookout, like meteors shooting from the sky. Our own guns savagely sent back shot for shot, sowing them thickly on the sides of mountain and ridge. The two lines of pickets were not more than three hundred yards apart; but on the picket line it was peaceful and calm, for, by common consent, there was no picket firing. For it is inhuman to shoot the man into whose eyes one can look, even if he be an enemy. The pickets were there to watch, and not to kill. Quietly they sat at the little "gopher pits," chaffing and sending back and forth boisterous jokes, while perhaps shrieking messengers of death, unheeded and unnoticed, flew over their heads. On a still night, standing on the picket line, one could hear the old negro song "Dixie," adopted by the Confederacy as their national music; while from our line came in swelling response, "Hail Columbia" and "The Star-Spangled Banner." With a glass Bragg's headquarters on Missionary Ridge, even the movement of his officers and orderlies, could be seen; while those on the ridge or on Lookout Mountain could bring into view our whole camp. By daylight our troops could be counted, our reveille heard, our roll-call noted, our scanty meals of half rations seen—the last without envy. And we were not only heard and seen, but the enemy's signal flag on Lookout talked, over our heads, with the signal flag on Missionary Ridge.

The fall rains were beginning, and hauling was becoming each day more difficult. Double teams could draw not much more than half loads. Quartermasters could not send mules to the front fast enough to take the place of those that were worked to death. Ten thousand dead mules walled the sides of the road from Bridgeport to Chattanooga. In Chattanooga the men were on less than half rations. Guards stood at the troughs of artillery horses to keep the soldiers from taking the scant supply of corn allowed these starving animals. Indeed, so slight was the allowance of forage that many horses died of starvation, and most of the survivors grew too weak for use in pulling

the lightest guns. Men followed the wagons as they came over the river, picking up the grains of corn and bits of crackers that fell to the ground. Yet there was no murmur of discontent.

Before Rosecrans had advanced from Tullahoma, he had urged the authorities at Washington to send him reinforcements, and to cause such operations to be made in other fields as would prevent reinforcements from being sent to Bragg. To his entreaties they turned a deaf

ear. Indeed, they were then about persuaded that Bragg was depleting his army by sending reinforcements to General Lee in Virginia; and they compelled Rosecrans to cross the Tennessee River with an insufficient force. The battle of Chickamauga dispelled such ideas, and caused great alarm. In haste they ordered General Sherman to move at once with the Fifteenth Army Corps from the vicinity of Vicksburg to Chattanooga, and sent by rail the Eleventh Corps and Twelfth Corps, —

fifteen thousand men,—under command of General Hooker, from the Army of the Potomac. Early in October Hooker reached Nashville, and as his men could not be fed in Chattanooga, they were temporarily strung along the railroad from Nashville to Bridgeport. Ever since Longstreet got into Lookout valley, Rosecrans had been making preparation to drive him out. A small stern-wheel steamboat was built at Bridgeport; a captured ferry-boat, reconstructed, was made an available transport; and material for boats and pontoons, or either, with stringers and flooring for bridges, was prepared at Chattanooga as rapidly as possible, at an improvised saw-mill. But the plan finally adopted was conceived and worked out by General William F. Smith, Chief Engineer of the Army of the Cumberland. On the 20th of October, after having been fully matured, it was submitted, and was warmly approved by Thomas, who had succeeded Rosecrans, and who at once gave orders to General Smith, General Hooker, and others to carry it into execution with all possible expedition.

October 16th the Military Division of the Mississippi was created. General Grant was placed in command, with directions to proceed at once to Chattanooga and take personal charge of operations. While *en route* for that point, he telegraphed from Louisville, Kentucky, on the 19th, relieving General Rosecrans and placing General Thomas in command. The same day he telegraphed to General Thomas:—

"Hold Chattanooga at all hazards. I will be there as soon as possible. Please inform me how long your present supplies will last, and the prospect of keeping them up."

General Thomas responded:

"Two hundred and four thousand and sixty-nine rations in store; 96,000 to arrive to-morrow, and all trains were loaded which had arrived at Bridgeport up to the 16th inst., probably 300 wagons. We will hold the town till we starve."

General Grant reached Chattanooga the evening of the 23d. The next day, in company with Generals Thomas and Smith, he rode to Brown's Ferry. There General Smith's plan was explained to him. He heartily approved it, and directed that its execution be proceeded with. Everything necessary for the movement being in readiness it was commenced with the greatest possible haste and secrecy on the night of the 26th. After midnight, fourteen hundred picked men from Hazen's and Turchin's brigades, under command of Brigadier-General Hazen, quietly marched to the river bank at Chattanooga; the rest of the troops of these two brigades, with three batteries of artillery under Major John Men-

denhall, crossed the river and marched over Moccasin Point to a place near Brown's Ferry, where, under cover of the woods, they waited the arrival of General Hazen's force. The success of this expedition depended on surprising the enemy at Brown's Ferry. It was known that he had there 1000 infantry, 3 pieces of artillery, and a squadron of cavalry, while Longstreet's corps was not far off. At 3 o'clock in the morning, 52 pontoons, filled with Hazen's 1400 men, and under the direction of Colonel T. R. Stanley, 18th Ohio Infantry, noiselessly started down the river on the nine-mile course to Brown's Ferry. There was a full moon, but the light was dimmed by floating clouds and by a fog rising from the water. Oars were used till the first picket fire of the enemy was approached; then the boats were steered close to the right bank, and allowed to float with the current. On top of Lookout a signal torch was seen flashing against the sky. Was it possible that the movement had been discovered, and that Lookout was telling Missionary Ridge? No; there were the pickets sitting around their fires on the south bank, unaware that fourteen hundred boys in blue were floating by within a stone's throw. Not a gun had yet been fired,—not an alarm given. The boats still hugged the right bank. Brown's Ferry was reached at break of dawn. Suddenly the oars were put into use, and before the enemy could make out the sounds, the boats were rowed to the left bank. The pickets on guard greeted them with a volley of musketry, and then fell back on their reserves. The fourteen hundred men quickly and in perfect order occupied the crest of a hill, and began to throw up light breastworks. But they had not proceeded far in this work when the enemy appeared and made a fruitless effort to drive them from the hill. In the mean time, the boats were bringing over the river the rest of the two brigades that had marched to the north ferry landing. When the transfer had been accomplished, the boats were used in the construction of a pontoon bridge, which was finished by 3 o'clock in the afternoon, and over which Mendenhall's artillery crossed. Work was impeded early in the day by shots from the guns on Lookout Mountain.

In accordance with the general plan, General Hooker, at daylight on the morning of October 27th, crossed the river at Bridgeport with the Eleventh and Geary's division of the Twelfth Corps, and moved along the direct road to Brown's Ferry by the base of Raccoon Mountain. He brushed away the enemy's pickets and light bodies of skirmishers, and moved cautiously, as he knew Longstreet was in Lookout valley, and might at any moment

appear to oppose his advance. It was his part to open and hold the river road, to co-operate with the Chattanooga force, and to protect the pontoon bridges from attacks that would almost certainly be made by Longstreet. At 5 o'clock in the afternoon, the head of his column reached a point about one mile from the ferry, up Lookout valley; and here his command went into camp, excepting Geary's division, which was left three miles in the rear, in a position covering the ferry. These movements were made in plain view of the enemy on Lookout Mountain, who evidently did not realize their importance or design in time to oppose them with good prospects of success. A short distance from the ferry, up the little valley of Lookout, was Longstreet, with his troops. Down below, near its mouth, his old enemy Hooker, with troops fresh from the Army of the Potomac, had just thrown down the gage of battle. From the commencement of the war these opposing forces had confronted each other in Virginia. Both had left their respective armies in Virginia to reënforce armies in the West, one moving on the northern half, the other on the southern half of a circle over two thousand miles in circumference, and by a sort of affinity had come face to face in this far-off valley at the foot of Lookout Mountain. Longstreet did not hesitate to accept the challenge. When he discovered Hooker's object, he did not even wait the light of day to repeat his old tactics. The night of the 27th was clear and the air crisp. The moon shone brightly from before midnight till morning. Hooker's troops were sleeping soundly after their hard march of nearly twenty-five miles, when Longstreet's men came crowding down the valley. An hour past midnight a terrific onslaught was made on Geary's division. It was assaulted on three sides. Artillery in the valley and on Lookout opened a severe fire. Our men, who slept in line of battle, sprang to their feet at the first shot of a sentinel. The contest lasted for three hours, till Longstreet's line was broken and his men driven from the field. It was Longstreet's intention to crush Geary; then, with his whole force, to attack General Howard's Eleventh Corps, nearly three miles away. In order to hold Howard where he was, and to prevent him from sending assistance to Geary, he had sent a smaller column to move round his camp, and, almost in its rear, to occupy a steep hill nearly two hundred feet high. General Howard ordered Colonel Orland Smith, with his brigade, to carry the hill. In gallant response a magnificent charge was made up the steep side, and the enemy was driven from the barricades on top at the point of the bayonet. Longstreet, routed at every

point, retreated up the valley, leaving it as the moon's pale light was fading over the hills and giving place to the coming brightness of day. Four hundred and twenty of our men, and many more of the enemy, were killed and wounded. Hooker thus gained Lookout valley; the siege of Chattanooga was raised; the "cracker line" was opened! Hooker's troops were truly messengers of glad tidings. In their wake followed hundreds of wagons, well filled with commissary stores, while the little Bridgeport steamer, loaded down to the guards, pushed its way up the river.

The credit of this result is chiefly due to General W. F. Smith, Chief Engineer of the Army of the Cumberland, who conceived the plan of operations, and under whose directions it was mostly carried out. A failure in any part of the combined movements would have resulted seriously, perhaps disastrously. Foreknowledge on the part of the enemy would have enabled him to thwart it. So secretly had material been prepared and movements made, that none of the thousands in camp at Chattanooga, save a very few officers, were aware of anything unusual being done, till, on the 28th, they were awakened by the roar of artillery and the rattling roll of musketry coming over from Lookout valley. The raising of the siege of Chattanooga, by opening up the river and the road on its south bank, was determined upon by the commanding officers of the Army of the Cumberland soon after the occupation, though the plan of operations was adopted later, but before General Grant came to Chattanooga.

There being no longer any need for Longstreet in Lookout valley, Bragg sent him, with his corps, to Knoxville for the purpose of driving out Burnside and regaining possession of East Tennessee. The authorities at Washington became greatly concerned for Burnside's safety, and urged Grant to send assistance. But this he could not then do. Troops could not be spared from Chattanooga, nor could Bragg be attacked in his stronghold till the arrival of Sherman with the Fifteenth Corps. But Burnside held out against the attacks of Longstreet, and the situation at Chattanooga remained unchanged, except that supplies were constantly coming, and the men and the horses were getting in condition for active work.

On November 15th, General Sherman reached Chattanooga in advance of his troops. The next day, with General Grant, General Thomas, and General Smith, he rode over the hills to a point from which he could get a good view of the north end of Missionary Ridge. This appeared to be unoccupied by the enemy, as far back as Tunnel Hill. General Grant, having here pointed out the ground, explained to General Sherman his plan of operations,

and gave him instructions for carrying out the part assigned to him. General Grant's plan, in brief, was to turn Bragg's right.

General Grant selected his old army—the Army of the Tennessee, now under command of General Sherman—to open the battle, to make the grand attack, and to carry Missionary Ridge as far as Tunnel Hill. The Army of the Cumberland was simply to get into position and coöperate with General Sherman; in fact, only to protect his right while he was doing this work. General Grant well knew the men whom he had thus honored; he had commanded them at Donelson, Pittsburg Landing, and Vicksburg. He knew there were no better soldiers, and they came fresh from Vicksburg, bearing with them the prestige of victory. When he was explaining his plan to General Sherman, he said that the men of Thomas's army had been so demoralized by the battle of Chickamauga, that he feared they could not be got out of their trenches to assume the offensive, and that the Army of the Cumberland had been so long in the trenches, that he wanted his troops to hurry up to take the offensive *first*, after which he had no doubt the Cumberland Army would fight well.

The men of the Army of the Cumberland gave most hearty welcome to their brethren of the Army of the Tennessee, who had marched from the far-off Mississippi to their assistance; but they were rather envious of them on account of the special distinction that had been given them and the glory that awaited them. They could not help feeling disappointed at not having been called on to do what they thought should have been their peculiar work. The army so close in front was their old adversary. They had driven it from the Ohio across the States of Kentucky and Tennessee; they had grappled with it in battle at Perryville, at Stone's River, and Chickamauga. Here was a grand opportunity to finish the battle of Chickamauga. Here was an opportunity for an effective, dramatic, and decisive conclusion.

No battle-field in our war, none in the wars of history, where large armies were engaged, was so spectacular, or so well fitted for a display of soldierly courage and daring as the amphitheater of Chattanooga. Late on the night of November 22d a sentinel who deserted from the enemy was brought to General Sheridan, and informed him that Bragg's baggage was being reduced, and that he was about to fall back. On account of these indications and reports, General Grant decided not to wait longer for General Sherman's troops to come up, but to find out whether Bragg was in fact withdrawing, and, if so, to attack him at once.

Therefore, at 11 o'clock on the morning of the 23d, he directed General Thomas to "drive in the enemy's pickets," and feel his lines for the purpose of finding out whether he still held in force. Thus General Grant was about to change his plans. He was compelled to depart from his original purpose, and was obliged to call on troops of the Army of the Cumberland to make the first offensive movement.

General Thomas ordered General Granger, commanding the Fourth Corps, "to throw one division of the Fourth Corps forward in the direction of Orchard Knob, and hold a second division in supporting distance, to discover the position of the enemy, if he still remained in the vicinity of his old camp."

Orchard Knob is a rough, steep hill, one hundred feet high, covered with a growth of small timber, rising abruptly from the Chattanooga valley, and lying about half way between our outer pits and the breastworks of logs and stones. At its western base, and extending for a mile beyond, both north and south of the hill, were other rifle-pits, hid in part by a heavy belt of timber that extended about a quarter of a mile from the foot of the hill into the plain. Between this belt of timber and our lines were open fields in which there was not a tree, fence, or other obstruction, save the bed of the East Tennessee Railroad. On the plain were hundreds of little mounds, thrown up by our own and the enemy's pickets, giving the appearance of an overgrown prairie-dog village.

At noon General Grant, Assistant Secretary of War Dana, General Thomas, Generals Hooker, Granger, Howard, and other distinguished officers stood on the parapet of Fort Wood, facing Orchard Knob, waiting to see this initial movement,—the overture to the battle of Chattanooga. At half-past twelve, Wood's division, supported by Sheridan, marched out on the plain, in front of the fort. It was an inspiring sight. Flags were flying; the quick, earnest steps of thousands beat equal time. The sharp commands of hundreds of company officers, the sound of the drums, the ringing notes of the bugle, companies wheeling and counter-marching and regiments getting into line, the bright sun lighting up ten thousand polished bayonets till they glistened and flashed like a flying shower of electric sparks,—all looked like preparations for a pageant, rather than for the bloody work of death.

Groups of officers on Missionary Ridge looked down through their glasses, and the enemy's pickets, but a few hundred yards away, came out of their pits and idly stood looking on, unconcernedly viewing what they supposed to be preparations for a grand review. But at half-past one o'clock the advance was sounded.

At once Wood's division, moving with the steadiness of a machine, started forward. Not a straggler or laggard was on the field, and, what was probably hardly ever before seen, drummers were marching with their companies, beating the charge. General Howard, who had just come from the East, remarked to an officer: "Why, this is magnificent! Is this the way your Western troops go into action? They could not go on dress parade better." Now the enemy realized, for the first time, that it was not a review. His pickets fell back to their reserves. The reserves were quickly driven back to the main line. Firing opened from the enemy's advanced rifle-pits, followed by a tremendous roll of musketry and roar of artillery. Men were seen on the ground, dotting the field over which the line of battle had passed. Ambulances came hurrying back with the first of the wounded. Columns of puffy smoke arose from the Orchard Knob woods. A cheer, faint to those on the parapet of Fort Wood, indicated that the boys in blue were carrying the breastworks on the Knob! A sharp, short struggle, and the hill was ours.

The capture of Orchard Knob, with the advancing of our lines half way to Missionary Ridge, had a most important bearing on the struggle at Chattanooga. It caused Bragg the same evening to withdraw Walker's division from Lookout Mountain, and transfer it to Missionary Ridge, for the purpose of strengthening his center and right, thus weakening his forces on Lookout Mountain, and rendering less doubtful the result of an assault on that stronghold,—not yet contemplated. It also gave General Thomas a much more advantageous position from which to coöperate with General Sherman the next day, and one from which the movements of the enemy in the valley between the Knob and Ridge could be better observed. And it showed the commanding general that the men of the Army of the Cumberland, who, against great odds, fought and held the field at Chickamauga, had not been rusted out by nine weeks of burial in enervating earthworks.

While Granger's troops were fighting at Orchard Knob, part of General Sherman's force was still at Brown's Ferry. The crossing was rendered slow and difficult because the pontoon bridge was frequently broken by logs and small rafts set afloat up stream by the enemy. In the afternoon all the divisions had crossed, except Osterhaus's, when another break in the bridge occurred, and several pontoons were carried down stream. It was found that this could not be repaired before night, or in time for Osterhaus to join Sherman in his movement against Missionary Ridge. Osterhaus was, therefore, ordered to report with his division to General Hooker, and the place of his

division, temporarily separated from the Fifteenth Corps, was filled by Davis's division of the Fourteenth Corps, Army of the Cumberland. About 4 o'clock in the afternoon of November 23d, when it became certain that Osterhaus would be attached to Hooker's command, General Thomas directed Hooker to make a demonstration against Lookout Mountain the next morning, and, if the demonstration showed it could be carried, to proceed to take it. Later in the day, orders to the same effect came to General Hooker from General Grant. The success at Orchard Knob, and the breaking of the bridge at Brown's Ferry, caused this radical change to be made in Grant's plans. Yet he still held to the chief feature, which was to turn Bragg's right.

The morning of November 24th opened with a cold, drizzling rain. Thick clouds of mist were settling on Lookout Mountain. At day-break Geary's division, and Whitaker's brigade of Cruft's division, marched up to Wauhatchie, the nearest point at which Lookout Creek, swelled by recent rains, could be forded, and there crossed at 8 o'clock. The heavy clouds of mist reaching down the mountain side hid the movement from the enemy, who was expecting and who was well prepared to resist a crossing at the Chattanooga road below. As soon as this movement was discovered, the enemy withdrew his troops from the summit of the mountain, changed front, and formed a new line to meet our advance,—his left resting at the palisade, and his right at the heavy works in the valley, where the road crossed the creek. Having crossed at Wauhatchie, Whitaker's brigade, being in the advance, drove back the enemy's pickets, and quickly ascended the mountain, till it reached the foot of the palisade. Here, firmly attaching its right, the brigade faced left in front, with its left joined to Geary's division. Geary now moved along the side of the mountain, and through the valley, thus covering the crossing of the rest of Hooker's command. In the mean time Grose's brigade was engaging the enemy at the lower road crossing, and Woods's brigade of Osterhaus's division was building a bridge, rather more than half a mile farther up the creek. Geary, moving down the valley, reached this point at 11 o'clock, just after the bridge was finished, and as Osterhaus's division and Grose's brigade were crossing. Hooker's command, now united in the enemy's field, was ready to advance and sweep round the mountain. His line, hanging at the base of the palisades like a great pendulum, reached down the side of the mountain to the valley, where the force that had just crossed the creek was attached as its weight. Now, as, at the command of Hooker, it swung

forward in its upward movement, the artillery of the Army of the Cumberland, on Moccasin Point, opened fire, throwing a stream of shot and shell into the enemy's rifle-pits at the foot of the mountain, and into the works thickly planted on the "White House" plateau. At the same time the guns planted by Hooker on the west side of the creek opened on the works which covered the enemy's right. Then followed a gallant assault by Osterhaus and Grose. After fighting for nearly two hours, step by step up the steep mountain side, over and through deep gutters and ravines, over great rocks and fallen trees, the earthworks on the plateau were assaulted and carried, and the enemy driven out and forced to fall back. He did so slowly and reluctantly, taking advantage of the rough ground to continue the fight. It was now 2 o'clock. A halt all along the line was ordered by General Hooker, as the clouds had grown so thick that a further advance was impracticable, and as his ammunition was almost exhausted and more could not well be supplied. Ammunition wagons could not be brought up the rough mountain side. But all of the enemy's works had been taken. Hooker had carried the mountain on the east side, and had opened communication with Chattanooga. His right was at the palisades, his left in the valley near the mouth of Chattanooga Creek, and he commanded the enemy's line of defensive works in Chattanooga valley.

In the morning it had not been known in Chattanooga, in Sherman's army, or in Bragg's camp, that a battle was to be fought. Indeed, it was not definitely known even to General Grant; for Hooker was only ordered to make a demonstration, and, if this showed a good chance for success, then to make an attack. Soon after breakfast, Sherman's men at the other end of the line, intent on the north end of Missionary Ridge, and Thomas's men in the center, fretting to be let loose from their intrenchments, were startled by the sound of artillery and musketry firing in Lookout valley. Surprise possessed the thousands who turned their anxious eyes toward the mountain. The hours slowly wore away; the roar of battle increased, as it came rolling around the point of the mountain, and the anxiety grew. A battle was being fought just before and above them. They could hear, but could not see how it was going. Finally, the wind, tossing about the clouds and mist, made a rift that for a few minutes opened a view of White House plateau. The enemy was seen to be in flight over the open ground, and Hooker's men were in pursuit! Then went up a mighty cheer from the thirty thousand in the valley, that was heard above the battle by their comrades on the mountain.

At 2 o'clock Hooker reported to General Thomas and informed him that he was out of ammunition. Thomas at once sent Carlin's brigade from the valley, each soldier taking with him all of the small ammunition he could carry. At 5 o'clock Carlin was on the mountain, and Hooker's skirmishers were quickly supplied with the means of carrying on their work.

As the sun went down, the clouds rolled away, and the night came on clear and cool. A grand sight was old Lookout that night. Not two miles apart were the parallel campfires of the two armies, extending from the summit of the mountain to its base, looking like great streams of burning lava, while, in between, the flashes from the muskets of the skirmishers glowed like giant fireflies.

The next morning there was silence in Hooker's front. Before daylight eight adventurous, active volunteers from the 8th Kentucky Infantry scaled the palisades and ran up from the highest point the Stars and Stripes. The enemy had stolen away in the night.

Although General Grant had twice changed his original plan, first in the movement from the center, then in the reconnaissance and resulting attack on Lookout Mountain, he still adhered to his purpose of turning Bragg's right, and made no change in the instructions given to General Sherman, except as to the time of attack. Every necessary preparation for crossing Sherman's troops had been made secretly, under direction of General W. F. Smith; one hundred and sixteen pontoons had been placed in North Chickamauga Creek, and in ravines near its mouth, and many wagon loads of "balks" (stringers) and chess (flooring) had been hid near by. An infantry and a cavalry brigade from the Army of the Cumberland took possession of the country just north of the river before this work began. Not a citizen, loyal or disloyal, nor a soldier, save those working on the bridge material, was allowed to enter or leave the territory. Before dark on the evening of November 23d, General Sherman had his troops well massed and hid behind the hills on the north side of the river opposite the end of Missionary Ridge. After dark General Brannan, Chief of Artillery of the Army of the Cumberland, planted fifty-six guns on the low foot hills on the north bank of the river, to cover Sherman's crossing and to protect the pontoon bridge when laid. Everything now being in readiness for the movement, at midnight General Giles A. Smith's brigade entered the pontoons, floated out of North Chickamauga Creek, and was rowed to the south bank of the river. Landing quietly, he surprised and captured the enemy's pickets, and secured a firm foothold.

The pontoons were sent across the river, and with these and the small steamboat brought up from Chattanooga, General Morgan L. Smith and General John E. Smith's divisions were ferried over the river. As soon as these troops had been landed, work was commenced on the pontoon bridge, which was skillfully laid under the supervision of General W. F. Smith. The bridge was 1350 feet in length, and was completed by 11 o'clock in the morning, when General Ewing's division and Sherman's artillery crossed. At 1 o'clock, just as Hooker was rounding the front of Lookout Mountain, the roar of his battle stirring the blood of the veterans of the Army of the Tennessee, General Sherman gave the command, "Forward!" His three divisions (composing the Fifteenth Corps, under command of General Frank P. Blair) advanced in three columns in echelon: on the left General Morgan L. Smith, following Chickamauga Creek, General John E. Smith having the center, and General Ewing the right. One brigade of General Jefferson C. Davis's division of the Army of the Cumberland was left at the bridge, and the other two were held in reserve between that point and the ridge, ready to move in any direction. At 3:30 General Sherman took the hill which was supposed to be the north end of the ridge. Soon afterwards one of his brigades took another hill a little in advance. These two hills were separated by a deep depression from the heavily fortified Tunnel Hill, on which Bragg's right flank rested and which was Sherman's objective point. General Grant thought that Sherman might take this position before Bragg could concentrate a large force to oppose him. As it was now too late in the day to attempt an assault on Tunnel Hill, Sherman threw up strong defensive works, and settled down for the night. At 4 o'clock he was vigorously attacked; but the enemy was handsomely repulsed, and Sherman still held the ground he had taken.

None of the men of the Army of the Cumberland, who for nine weeks were buried in the trenches at Chattanooga, can ever forget the glorious night of the 24th of November. As the sun went down, the clouds rolled up the mountain, and the mist was blown out of the valley. Night came on clear, with the stars lighting up the heavens. But there followed a sight to cheer their hearts and thrill their souls. Way off to their right, and reaching skyward, Lookout Mountain was ablaze with the fires of Hooker's men, while off to their left, and reaching far above the valley, the north end of Missionary Ridge was aflame with the lights of Sherman's army. The great iron crescent that had, with threatening aspect, so long hung over them, was disappearing.

The only thought that dampened their enthusiasm was that the enemy was being destroyed on the flanks, while they were tied down in the center, without a part in the victories. But late that night General Grant, thinking that General Sherman had carried Tunnel Hill, and acting in that belief, gave orders for the next day's battle. General Sherman was directed to attack the enemy at early dawn, and Thomas to coöperate with him, either by attacking the rifle pits in front, or by moving to the left, as might be determined by the result of Sherman's movement, and Hooker to hold himself in readiness to advance into Chattanooga valley, provided he could, with a small force, hold the Summertown road,—the road that zig-zagged from Chattanooga valley to the summit of the mountain. Early the next morning, when General Grant learned that the ridge had not been carried as far as Tunnel Hill, and that Lookout Mountain had been evacuated, he suspended operations which had been ordered, except in so far as General Sherman was concerned. Hooker was directed to come down from the mountain, and press forward on the road leading to Rossville; to carry the pass at that point, and then to operate on Bragg's left and rear. Bragg's army was now concentrated on Missionary Ridge, and in the valley at the east foot. Cheatham's and Stevenson's divisions had been withdrawn from Lookout Mountain the night of the 24th, and, marching all night, were seen at dawn the next morning moving along the summit of Missionary Ridge, on the way to reinforce Bragg's right. For several hours after daylight, the flowing of this steady stream of troops continued.

Early in the morning of the 25th, General Grant and General Thomas established their headquarters on Orchard Knob, a point from which the best view of the movements of the whole army could be had. At sunrise General Sherman commenced his attack. The gallant General Corse moved, with his brigade, down into the ravine, and up the fortified hill held by the enemy. General Morgan L. Smith on the left, and Colonel J. M. Loomis on the right, moved along the east and west base of the ridge,—all having strong reserves. Corse secured a high crest within three hundred feet of the enemy's works. From here he made an assault, was driven back, and again returned to the assault. Severe fighting continued for over an hour, during which time Corse, though he could make no impression on the enemy's works, retained the ground he had taken, despite a furious assault made upon him. General Smith gained the left spur of the ridge, and was abreast of the tunnel and railroad embankment. At 10 o'clock General Corse, having

THE BATTLE OF LOOKOUT MOUNTAIN. (SEE ALSO PICTURES IN THE APRIL CENTURY.)

This picture shows the Union troops fighting in the woods near the top of Lookout Mountain.

Early in October Jefferson Davis visited Lookout Mountain with General Bragg. As they approached the edge of the cliff, Bragg,

with a wave of the hand, alluded to "the fine view": whereupon Major Robert W. Wooley, who had little faith in the military outlook, exclaimed to a brother officer, but so that all could hear: "Yes, it's a fine view, but a — bad prospect."—EDITOR.

been badly wounded, was carried off the field. About 2 o'clock two reserve brigades from the right were ordered up to assist in making another assault. In passing over an open field, well up on the side of the ridge, they were attacked in the right rear by a large body of the enemy, that had formed in the railroad gorge, and whose appearance had been hid from view by thick brush and undergrowth. The suddenness of the attack disconcerted them, and they fell back in disorder across the open field, but

halted and re-formed in the edge of the woods. After this, it appearing to be impossible for General Sherman to take the enemy's works, operations ceased.

General Grant being determined to turn Bragg's right, and seeing that General Sherman could make no progress, at 10 o'clock withdrew General Howard's two divisions from General Thomas's left and sent them to reënforce General Sherman. Later in the day General Baird's division was withdrawn from

General Thomas's right and was likewise sent to General Sherman. Thomas's command had been heavily drawn upon. Including Davis's, four divisions of the Army of the Cumberland had been sent to Sherman, and he then had more than one-half of all the troops operating at Chattanooga. Having more than he could handle at the north end of the ridge, he sent Baird's division back to Thomas, and it went into position on the left, in the place that had been occupied by Howard's command.

While Sherman was engaging the enemy, Hooker was coming down from Lookout Mountain, and pushing for Rossville. He was detained three hours at Chattanooga Creek, while a bridge that the retreating enemy had burned was being rebuilt. As soon as the stringers were laid, General Osterhaus's division crossed, and rapidly advanced to Rossville, where, after a severe skirmish, it captured a large quantity of stores, wagons, and ambulances. As soon as he had taken Rossville, Hooker moved against the south end of Missionary Ridge. The ridge was quickly carried, and, sweeping northward, Hooker soon came upon Stewart's division, posted on the summit, and behind the earthworks which the Army of the Cumberland had thrown up the day after Chickamauga. Cruft's division assaulted and carried the works, thus having the good fortune of retaking the works they themselves had constructed. It was by this time nearly sundown. Hooker reached the south end of the ridge too late in the day to relieve the pressure on Sherman, who was at the north end six miles off. Bragg's right had not been turned. Success had not followed Sherman's movement. The battle as planned had not been won.

Late on this memorable afternoon, there was an accident—an accident like the charge at Balaklava; though, unlike this theme for poetry, it called for greater daring, and was attended by complete success, and yielded most important results, for it led to the complete shattering of the enemy's army, and drove him from the field. On Orchard Knob, and opposite the center of Missionary Ridge, were four divisions of the Army of the Cumberland. On the left was Baird's division; then Wood's and Sheridan's divisions occupying the lines which, two days before, they had taken in their magnificent advance; on the right was Johnson's division,—all under the personal command of Thomas. It was past 3 o'clock. General Sherman had ceased operations. General Hooker's advance had not yet been felt. The day was dying, and Bragg still held the ridge. If any movement to dislodge him was to be made that day it must be made at once. At half-past three o'clock, an attack was ordered by General Grant. He had changed his plan of

battle. At once orders were issued that at the firing, in rapid succession, of six guns on Orchard Knob, Thomas's whole line should instantaneously move forward, Sheridan's and Wood's divisions in the center, Sheridan to be supported on the right by Johnson, and Wood on the left by Baird's divisions. This demonstration was to be made to relieve the pressure on Sherman. The only order given was to move forward and take the rifle-pits at the foot of the ridge. In Sheridan's division, the order was, "As soon as the signal is given, the whole line will advance, and you will take what is before you."

Between Orchard Knob and Missionary Ridge was a valley, partly covered with a small growth of timber. It was wooded in front of the right of Baird's and of the whole of Wood's division. In front of Sheridan's and Johnson's it had been almost entirely cleared. At the foot of the ridge were heavy rifle-pits, which could be seen from Orchard Knob, and extending in front of them for four and five hundred yards, the ground was covered with felled trees. There was a good plain for both direct and enfilading fire from the rifle-pits, and the approaches were commanded by the enemy's artillery. At this point the ridge is five or six hundred feet high. Its side, scored with gullies, and showing but little timber, had a rough and bare appearance. Halfway up was another line of rifle-pits, and the summit was furrowed with additional lines and dotted over with epaulements, in which were placed fifty pieces of artillery. The art of man could not have made a stronger fortress. Directly in front of Orchard Knob, and on the summit of the ridge, was a small house, where Bragg had established his headquarters.

At twenty minutes before four, the signal guns were fired. Suddenly twenty thousand men rushed forward, moving in line of battle by brigades, with a double line of skirmishers in front, and closely followed by the reserves in mass. The big siege guns in the Chattanooga forts roared above the light artillery and musketry in the valley. The enemy's rifle-pits were ablaze, and the whole ridge in our front had broken out like another *Ætna*. Not many minutes afterwards our men were seen working through the felled trees and other obstructions. Though exposed to such a terrific fire, they neither fell back nor halted. By a bold and desperate push they broke through the works in several places, and opened flank and reverse fires. The enemy was thrown into confusion, and took precipitate flight up the ridge. Many prisoners and a large number of small arms were captured. The order of the commanding general had now been fully and most successfully carried

THE CHARGE UP MISSION RIDGE OF BAIRD'S, WOOD'S, SHERIDAN'S, AND JOHNSON'S DIVISIONS.
(FROM THE PENCIL SKETCH FOR ONE SECTION OF THE CYCLOPAMA OF THE BATTLE OF MISSIONARY RIDGE.)

out. But it did not go far enough to satisfy these brave men, who thought the time had come to finish the battle of Chickamauga. There was a halt of but a few minutes, to take breath and to re-form lines; then, with a sudden impulse, all started up the side of the ridge. Not a commanding officer had given the order to advance. The men who carried the muskets had taken the matter into their own hands, had moved of their own accord. Officers, catching their spirit, first followed, then led. There was no thought of protecting flanks, though the enemy's line could be seen, stretching beyond on either side; there was no thought of support, or reserves.

As soon as this movement was seen from Orchard Knob, Grant quickly turned to Thomas, who stood by his side, and I heard him angrily say: "Thomas, who ordered those men up the ridge?" Thomas replied, in his usual slow, quiet manner: "I don't know; I did not." Then addressing General Gordon Granger, he said: "Did you order them up, Granger?" "No," said Granger: "they started up without orders. When those

fellows get started, all hell can't stop them." General Grant said something to the effect that somebody would suffer if it did not turn out well, and then, turning round, stoically watched the ridge. He gave no further orders.

As soon as Granger had replied to Thomas, he turned to me, his chief-of-staff, and said: "Ride at once to Wood and then to Sheridan, and ask them if they ordered their men up the ridge, and tell them, if they can take it, to push ahead." As I was mounting, Granger added: "It is hot over there, and you may not get through. I shall send Captain Avery to Sheridan, and other officers after both of you." As fast as my horse could carry me, I rode first to General Wood, and delivered the message. "I didn't order them up," said Wood; "they started up on their own account, and they are going up, too! Tell Granger, if we are supported, we will take and hold the ridge!" As soon as I reached General Wood, Captain Avery got to General Sheridan, and delivered his message. "I didn't order them up," said Sheridan; "but we are going to take the ridge." He then asked Avery for his flask and waved

it at a group of Confederate officers, standing just in front of Bragg's headquarters, with the salutation, "Here's at you!" At once two guns—the "Lady Breckinridge" and the "Lady Buckner"—in front of Bragg's headquarters were fired at Sheridan and the group of officers about him. One shell struck so near as to throw dirt over Sheridan and Avery. "Ah!" said the General, "that is ungenerous; I shall take those guns for that!" Before Sheridan received the message taken by Captain Avery, he had sent a staff officer to Granger, to inquire whether "the order given to take the rifle-pits meant the rifle-pits at the base, or those on the top of the ridge?" Granger told this officer that "the order given was to take those at the base." Conceiving this to be an order to fall back, the officer, on his way to Sheridan, gave it to General Wagner, com-

manding the Second Brigade of the division, which was then nearly half way up the ridge. Wagner ordered his brigade back to the rifle-pits at the base, but it only remained there till Sheridan, seeing the mistake, ordered it forward. It again advanced under a terrific fire that was raking the lower part of the ridge.

The men, fighting and climbing up the steep hill, sought the roads, ravines, and less rugged parts. The ground was so broken that it was impossible to keep a regular line of battle. At times their movements were in shape like the flight of migratory birds,—sometimes in line, sometimes in mass, mostly in V-shaped groups, with the points towards the enemy. At these points regimental flags were flying, sometimes drooping as the bearers were shot, but never reaching the ground, for other brave hands were there to seize them. Sixty flags were ad-

vancing up the hill, in the faces of its defenders. Bragg was hurrying large bodies of men from his right to the center. They could be seen coming along the summit of the ridge in double-quick time. Cheatham's division was being withdrawn from Sherman's front. Bragg and Hardee were at the center, doing their uttermost to encourage their troops, and urging them to stand firm and drive back the advancing enemy, now so near the summit — indeed, so near that the guns, which could not be sufficiently depressed to reach them, became useless. Artillerymen were lighting the fuses of shells, and bowling them by hundreds down the hill. The critical moment arrived when the summit was just within reach. At six different points, and almost simultaneously, Sheridan's and Wood's divisions broke over the crest, — Sheridan's first, near Bragg's headquarters; and in a few minutes Sheridan was beside the guns that had been fired at him, and claiming them as captures of his division. Baird's division took the works on Wood's left almost immediately afterwards; and then Johnson came up on Sheridan's right. The enemy's guns were turned upon those who still remained in the works, and soon all were in flight down the eastern slope. Baird got on the ridge just in time to change front, and oppose a large body of the enemy moving down from Bragg's right to attack our left. After a sharp engagement, that lasted till dark, he drove the enemy back beyond a high point on the north, which he at once occupied.* The sun had not yet gone down, Missionary Ridge was ours,

and Bragg's army was broken and in flight! Dead and wounded comrades lay thickly strewn on the ground; but thicker yet were the dead and wounded men in gray. Then followed the wildest confusion, as the victors gave vent to their joy. Some madly shouted; some wept from very excess of joy; some grotesquely danced out their delight, — even our wounded forgot their pain, to join in the general hurrah. But Sheridan did not long stop to receive praise and congratulations. With two brigades he started down the Mission Mills road, and found, strongly posted on a second hill, the enemy's rear. They made a stout resistance, but by a sudden flank movement he drove them from the heights, and captured two guns and many prisoners. The day was succeeded by a clear moonlight night. At 7 o'clock General Granger sent word to General Thomas that by a bold dash at Chickamauga Crossing, he might cut off a large number of the enemy now supposed to be leaving Sherman's front, and that he proposed to move in that direction. It was midnight before guides could be found, and then General Sheridan again put his tired and well-worn men in motion. He reached the creek just as the rear guard of the enemy was crossing, and pressed it so closely that it burned the pontoon bridge before all its troops were over. Here Sheridan captured several hundred prisoners, a large number of quartermaster's wagons, together with caissons, artillery, ammunition, and many small arms.

In this battle, Sheridan's and Wood's divis-

* Governor John A. Martin, of Kansas, colonel of the 8th Kansas Volunteers, of Willich's brigade, Wood's division, in a letter to General Fullerton dated November 16th, 1866, describes the change as follows: "When the advance on Mission Ridge was ordered, on November 25th, my regiment went out directly from Orchard Knob. General Willich, in communicating to me the orders received, distinctly stated that we were directed to take the line of Confederate works at the foot of the hill. We reached these works without serious difficulty, the losses being very small. Shortly after, we emerged from the woods into the open field, and were charging the Confederate works on the double-quick; the soldiers there threw down their arms, and, holding up their hands, in token of surrender, jumped to our side. I had ridden my horse to this line, and, on reaching it, halted my regiment behind the enemy's intrenchments. Dismounting, I ran forward to the line that was cut by the Confederates, on the plateau just back of their line, with a view of ascertaining what the situation was. I had seen, as soon as I reached the first line of works, as did every soldier in the command, that it was impossible for the troops to remain there long. The line was within easy range of the musketry on the summit of the ridge, and was raked by the artillery fire on the projecting points of the ridge on either side. Reaching the foot of the ridge east of the plateau, I found the position there fairly well protected, — that is, not so easily reached, either by the musketry or artillery of the enemy, — and I at once ran back to near where my regiment had been halted. Just as I got there General Willich came up, and I said to him, 'We can't live here, and ought to go forward.' He gave me directions to move ahead, and I at once ordered my regiment forward. By that time, or about that time, it seemed to me that there was a simultaneous advance of many of the regiments in different parts of the line, and I got the impression that possibly orders had been communicated for an advance on the ridge, which I had not received. Hence I hurried my regiment forward as rapidly as possible. When I reached the foot of the ridge again, with the regiment, my orderly came up with my horse, and I mounted it, as my assistant did his. The advance to the ridge was as rapid as the nature of the ground would permit; and I think, from the position I occupied, I had a fair opportunity to see what was going on, not only immediately above me, but to the right and

left. I was impressed with the idea, I know, that a sharp rivalry had sprung up between several regiments, including my own, as to which should reach the summit first. Another idea, I remember distinctly, which impressed me, was that the different regiments had assumed the form of a triangle or wedge — the advance point in nearly every case being the regimental battle-flag. I have always believed that my own regiment made the first break in the enemy's lines on the summit of Mission Ridge; but the difference between the break thus made by the 8th Kansas and the progress made by one or two regiments of Hazen's brigade on our right and the 25th Illinois of our own brigade, was exceedingly brief.

"But that the first break in the enemy's lines was made in front of our division, I have not the slightest doubt. After we passed through the Confederate works, and while the men were rushing with great enthusiasm after the fleeing Confederates, who were running down the hill on the other side, my attention was directed to the right, where, at the point of a knob, I saw other troops were still engaged in a fierce struggle with the Confederates, who were yet in force behind their works; and while thus, for a moment, watching the progress of the fight to the right, a Confederate battery on a point to the left of our position was swung round, and poured a fire directly down our line. Immediately I ordered my bugler to sound the recall, and began forming all the troops I could gather at that point, with a view of moving to the left to clear the enemy's works in that direction. I had assembled probably a hundred men, when suddenly the whole Confederate line, both to the right and left, gave way before the furious attack of our troops, and was soon in full retreat through the woods and down the roads to the rear.

"I have stated, hastily, some of my impressions of the battle, but the principal point which, in my judgment, should always be made prominent is the fact that Mission Ridge was fought without orders from the commander-in-chief. I remember, too, and this only confirms what I have said, that shortly after the battle was over General Granger rode along our lines, and said, in a joking way, to the troops, 'I am going to have you all court-martialed! You were ordered to take the works at the foot of the hill, and you have taken those on top! You have disobeyed orders, all of you, and you know that you ought to be court-martialed!'" — EDITOR.

ions—the two center assaulting divisions—took 31 pieces of artillery, several thousand small arms, and 3800 prisoners. In that one hour of assault they lost 2337 men in killed and wounded,—over twenty per cent. of their whole force! On the northern end of the ridge, General Sherman lost in his two days'

fighting 1697 in killed and wounded. Of these, 1268 were in his own three divisions. During the night the last of Bragg's army was withdrawn from Missionary Ridge, and Chattanooga from that time remained in undisputed possession of the Union forces.

J. S. Fullerton.

MEMORANDA ON THE CIVIL WAR.

"Lee's Invasion of Pennsylvania"—A Reply to General Longstreet.

GENERAL LONGSTREET'S article on Gettysburg in the February CENTURY is notable for its mistakes as well as for its attitude toward General Lee and others.

First. The statement that General Lee passed over more deserving officers from other States in order to give the command of his corps to Virginians is an unworthy attack upon a man who was as singularly free from such prejudices as he was from self-seeking, either during the war or after it. Lee said in a letter to President Davis, October 2d, 1862:

"In reference to commanders of corps with the rank of lieutenant-general, of which you request my opinion, I can confidently recommend Generals Longstreet and Jackson, in this army. My opinion of the merits of General Jackson has been greatly enhanced during this expedition. He is true, honest, and brave; has a single eye to the good of the service, and spares no exertion to accomplish his object. Next to these two officers I consider General A. P. Hill the best commander with me. He fights his troops well and takes good care of them. At present I do not think that more than two commanders of corps are necessary for this army."

This was Lee's judgment after a campaign in which both the Hills and McLaws had served, and long before there was any question of making either of them a lieutenant-general. It would be about as just to accuse Lee of undue partiality to Georgia in making Longstreet his senior lieutenant, as it is to accuse him of partiality to Virginia in selecting A. P. Hill rather than D. H. Hill or McLaws for the command of his third corps.

Second. In regard to the battle of Gettysburg: the first day's fight was brought on unexpectedly to Lee. In the absence of Stuart he was not aware of the proximity of the Federal army. The first day's operations were very successful. Two of the seven infantry corps of the Federal army were virtually demolished, having been defeated and driven in disorder completely from the field, leaving many killed and wounded and several thousand prisoners to the victors.

Third. It was at the close of this day's work that General Lee, in view of its results, and of the indications it gave of the position of the Federal army, decided to follow up the fight. General Longstreet advised a movement across Meade's front to threaten his left and rear. Such a movement would have been difficult in the absence of Stuart; it could not have been executed in the then position of the army with sufficient promptness to surprise Meade; and if successful it simply would have forced the Federal army back to some position nearer Baltimore and Washington where the issue of battle was still to be tried. General Longstreet begs the question when he assumes that Meade would then have been obliged to attack at a disadvantage. General Lee decided that this plan did not promise as good results as to follow up the partial victory already gained. More than one-fourth of the Fed-

eral army was beaten. (Of the First and Eleventh Corps that had numbered 20,931 on June 30th, not 5700 were in line on July 2d.) That army was not concentrated, and hours must elapse before its full strength could be marshalled for battle. The absent portions would reach the field jaded by forced marches to meet the depressing news of the defeat of their comrades. Doubt and uncertainty would prevail, increased perhaps by the fact that the present Federal commander was so new in his place. Lee's troops were much better up, only Pickett's division and Law's brigade being out of reach. Not to press the Union army was to lose the greater part of the advantage of the first day's victory. The Federals would soon recover from their depression if not pressed, and his own troops would be disappointed. Lee believed if he could attack early on the second day he would have but part of the Federal army to deal with, and that if he could repeat his success of the first day the gain would be great. He therefore determined upon attack. On the night of the 1st (not on the forenoon of the 2d, as General Longstreet has it) he decided, after a conference with Ewell and his division commanders, to make the attack early next day from his right with Longstreet's two divisions that were within reach, this attack to be supported by Hill and Ewell. (See Ewell's and Early's reports; Early's paper in "South. Hist. Papers," Vol. IV., p. 241; and Long's "Memoirs of Lee.")

Fourth. General Longstreet would have us infer that he was not ordered by General Lee to attack early on the second day; but that his memory is at fault on this point has been abundantly shown by Generals Fitz Lee, Pendleton, Early, Wilcox, and many others. No testimony on this point is more direct and conclusive than that of General A. L. Long, then military secretary to General Lee. He says in his recently published "Memoirs of R. E. Lee" (page 277), that on the evening of the 1st, when General Lee had decided not to renew the attack on Cemetery Hill that day, he said (in Long's presence) to Longstreet and Hill, "Gentlemen, we will attack the enemy in the morning as early as practicable." Long continues: "In the conversation that succeeded he [Lee] directed them to make the necessary preparations and be ready for prompt action the next day." Long shows plainly that General Lee's design was to attack the troops in front before the whole Federal army could get up, and he describes graphically the impatience Lee showed next morning, as early as 9 A. M., at Longstreet's delay. General Longstreet is wrong, too, in giving the impression that his divisions were 15 or 20 miles away on the night of the 1st, for in his official report he says that "McLaws' division. . . reached Marsh Creek, 4 miles from Gettysburg, a little after dark, and Hood's division [except Low's

brigade] got within nearly the same distance of the town about 12 o'clock at night." Hood says he was with his staff "in front of the heights of Gettysburg shortly after daybreak" on the 2d and his troops were close behind. Kershaw (of McLaws' division) says in his official report that on the 1st of July they "marched to a point on the Gettysburg road some two miles from that place, going into camp at 12 P. M."

General Longstreet, to explain his delay, besides the above reasons scrapes together a number of others,—such as the presence of some Federal scouts and pickets west of the Emmettsburg road, the movement of Sickles's rear-guard along that road, the presence of one of General Lee's engineers (who had been sent to give information, not to command his corps). No time need be wasted on these. The fact is that General Longstreet, though knowing fully the condition of things on the night of the 1st, knowing that Lee had decided to attack that part of the Federal army in his front, knowing that every hour strengthened Meade and diminished the chances of Confederate success, and knowing that his corps was to open the battle and deliver the main assault, consumed the time from day night to nearly 4 P. M., on July 2d, in moving his troops about four miles, over no serious obstacle, and in getting them into battle. Meantime on the Federal side Hancock's corps, which had camped three miles from Gettysburg, reached the field by 6 or 7 A. M.; Sickles's two brigades that had been left at Emmettsburg came up by 9 A. M.; the rear of the Fifth Corps by midday, and the Sixth Corps, after a march of 32 miles in 30 hours, by 2 P. M. Had Longstreet attacked not later than 9 or 10 A. M., as Lee certainly expected, Sickles's and Hancock's corps would have been defeated before part of the Fifth and the Sixth Corps arrived. Little Round Top (which, as it was, the Fifth Corps barely managed to seize in time) would have fallen into Confederate possession; and even if nothing more had been done this would have given the field to the Confederates, since the Federal line all the way to Cemetery Hill was untenable with Round Top in hostile hands.

Fifth. That Longstreet's attack when made was poorly seconded by the other corps may be true, and thus another chance of winning a complete victory on July 2d was lost, but this does not change the fact that the first and great opportunity of that day for the Confederates was lost by Longstreet's delay.

Sixth. Victory on the third day was for the Confederates a far more difficult problem than on the second, but it was still within their reach. But one need not be surprised at the failure of Pickett's attack after reading in this article of the hesitation, the want of confidence and hearty coöperation, with which General Longstreet directed it. Lee never intended that Pickett, Pettigrew, and Trimble should fight unsupported by the remainder of the army. He expected "that with proper concert of action . . . we should ultimately succeed." (Lee's report.) Longstreet was directed to use his whole corps, and when he felt embarrassed by the Federal forces on or near the Round Tops he was given a division and a half from A. P. Hill's corps with power to call for more. General Long says: "The original intention of General Lee was that Pickett's attack should be supported by the divisions of McLaws and Hood, and General Longstreet was so ordered." ("Memoirs of Lee," page 294. See also statements of

Colonels Venable and Taylor, "Four Years with General Lee," page 108.) Lee's efforts for a concerted attack were ineffectual. Pickett was overwhelmed not by troops in front but by those on his flanks, especially by those on his right flank, where Wilcox was sent forward too late to be of use, and where he was too weak to have effected much at best. Yet Longstreet did not use any part of Hood's and McLaws' divisions to support Pickett, or to make a division in his favor, or to occupy the troops on his flank which finally defeated him. These divisions were practically idle except that one of Hood's brigades was occupied in driving off the Federal cavalry which made a dash on that flank. Longstreet, in a word, sent forward one-third of his corps to the attack, but the remainder of his troops did not coöperate. And yet he reproaches Lee for the result!

McDONOGH, MD., February 16, 1887.

W. Allan.

Stuart's Ride around the Union Army in the Gettysburg Campaign.

It is generally agreed by Southern writers that the battle of Gettysburg was the result of an accidental collision of armies. General Lee in effect says in his report of the campaign that his failure was due to his ignorance of the movements of the enemy; and the absence of a portion of the cavalry under Stuart, or rather its separation from the army, is assigned as the primary cause of its failure by General Long, the biographer of General Lee, and by General Longstreet in the February CENTURY, 1887. Both ignore the fact that Stuart left with General Lee, under command of General Beverly H. Robertson, a larger body of cavalry than he took with him. General Long charges that Stuart's expedition around Hooker was made either from "a misapprehension of orders or love of the éclat of a bold raid" (which, of course, implies disobedience); and General Longstreet, while admitting that Stuart may have acted by authority of Lee, says that it was undertaken against his own orders, which were to cross the Potomac at Shepherdstown, west of the Blue Ridge.

That General Lee was greatly embarrassed by want of intelligence of the movements of the enemy was not due to the lack of cavalry; and Stuart is not responsible for the inefficient manner in which he was served.

When it was determined that Stuart should take three brigades of cavalry to join Ewell on the Susquehanna and leave his other two to perform outpost duty for the army in Virginia, General Lee was in the Shenandoah Valley with the corps of Hill and Longstreet. The latter was holding the gaps and Stuart was guarding the approaches to them east of the Ridge. Hence Stuart came under Longstreet's orders. Hooker's headquarters were in Fairfax, with his army spread out like a fan—his left being at Thoroughfare Gap and his right on the Potomac at Leesburg. On returning from a scout, I reported to Stuart the scattered condition of Hooker's corps, and he determined, with the approval of General Lee, to pass around, or rather through, them, as the shortest route to Ewell. There was an opportunity besides to inflict much damage and to cut off communication between Washington and the North.

I have lately discovered documents in the archives of the War Department that set at rest the question of Stuart's alleged disobedience of orders, and show that General Longstreet then approved a plan which he now

condemns as "a wild ride around the Federal army." He directed Stuart to pass around *the rear of the enemy* in preference to crossing west of the Ridge, in order to prevent disclosing our designs.*

Under date of June 22d, 7:30 P. M., he writes to General Lee: "I have forwarded your letter to General Stuart, with the suggestion that he *pass by the enemy's rear* if he thinks he may get through."

Up to the morning of June 25th it was perfectly practicable for Stuart to have done so. In accordance with Lee's and Longstreet's instructions, Stuart withdrew from the front on the evening of the 24th to pass around Hooker, leaving Robertson about Middleburg with three thousand cavalry and two batteries of artillery to observe the enemy. Stuart's success depended upon preserving the *status quo* of the Federal army until he could get through it. *Hooker was on the defensive waiting for his adversary to move.* It did not seem to occur to General Longstreet that the march of the infantry down the Shenandoah Valley would disclose all to the enemy that the cavalry would have done. It was no fault of Stuart's that he was foiled by events which he could not control. When on the morning of the 25th he reached Hooker's rear, he found his whole army moving to the Potomac and all the roads occupied by his troops. This compelled a wide détour, and instead of crossing the river in advance of the enemy, as he expected, he was two days behind him. Thus all communication was broken with General Lee and Ewell. The march of Hill's and Longstreet's corps on the day before had been in full view of the signal stations on Maryland Heights and was telegraphed to Hooker, who made a corresponding movement.

On the morning of June 26th the enemy disappeared from Robertson's front and crossed the Potomac. In that event his instructions from Stuart were, "to watch the enemy and harass his rear — to cross the Potomac and follow the army, keeping on its right and rear," and "to report anything of importance to Lieutenant-General Longstreet, with whose position you will communicate by relays through Charlestown."

* "HEADQUARTERS, MILLWOOD, June 22, 1863, 7 P. M. MAJ.-GEN'L J. E. B. STUART, Comdg. Cavalry. GENERAL: General Lee has inclosed to me this letter for you to be forwarded to you provided you can be spared from my front, and provided I think that you can move across the Potomac without disclosing our plans. He speaks of you leaving *via* Hopewell Gap and passing by the rear of the enemy. If you can get through by that route. I think that you will be less likely to indicate what our plans are than if you should cross by passing to our rear. I forward the letter of instructions with these suggestions. Please advise me of the condition of affairs before you leave and order General Hampton — whom I suppose you will leave here in command — to report to me at Millwood either by letter or in person, as may be most agreeable to him. Most respectfully, J. LONGSTREET, Lieutenant-General. — N. B. I think that your passage of the Potomac by our rear at the present moment will in a measure disclose our plans. You had better not leave us, therefore, unless you can take the proposed route in rear of the enemy. J. LONGSTREET, Lieutenant-General."

"HEADQUARTERS, 22d June, 1863. MAJOR-GENERAL J. E. B. STUART, Commanding Cavalry. GENERAL: I have just received your note of 7:45 this morning to General Longstreet. I judge the efforts of the enemy yesterday were to arrest our progress and ascertain our whereabouts. Perhaps he is satisfied. Do you know where he is and what he is doing? I fear he will steal a march on us and get across the Potomac before we are aware. If you find that he is moving northward, and that two brigades can guard the Blue Ridge and take care of your rear, you can move with the other three into Maryland and take position on General Ewell's right, place yourself in communication with him, guard his flank and keep him informed of the enemy's movements, and collect all the supplies you can for the use of the army. One column of General Ewell's army will probably move toward the Susquehanna by the Emmetsburg route, another by Chambersburg. Accounts from him last night state that there was no enemy west of Fredericktown. A cavalry force (about one hundred)

Robertson retired to the mountain gaps and remained until the afternoon of the 29th, when he was recalled to the army by a courier from General Lee. At night on the 27th General Lee heard, through a scout at Chambersburg, of Hooker's advance. As no information of it had come from the cavalry he had left in Hooker's front in Virginia, he thought that Hooker was still there. He immediately issued an order for the concentration at Gettysburg, and sent for Robertson's command, that had been left, he says, to hold the mountain passes "*as long as the enemy remained south of the Potomac.*" It had staid there three days after they had gone. As Stuart had been ordered to Ewell on the Susquehanna, it could not have been expected that he should also watch Hooker on the Potomac. Stuart's instructions to divide the cavalry and take three brigades with him to Ewell, on the Susquehanna, were peremptory; he was only given discretion as to *the point of crossing the Potomac.* It was therefore immaterial, so far as giving information to General Lee was concerned, whether he crossed east or west of the ridge. In either event they would have been separated and out of communication with each other. General Lee must then have relied on Robertson or nobody to watch Hooker.

Instead of keeping on the right of the army and in close contact with the enemy, as Stuart had ordered, Robertson's command marched *on the left* by Martinsburg and did not reach the battle-field. When General Lee crossed the Potomac, he left General Robertson between him and the enemy. By July 3d he had so manoeuvred that Lee was between him and the enemy. Stuart had ridden around General Hooker while Robertson was riding around General Lee. If, in accordance with Stuart's instructions, Robertson had promptly followed on the right of the army when the enemy left, it would have been ready and concentrated for attack; a defensive battle would have been fought, and Gettysburg might have been to Southern hearts something more than a

• "Glorious field of grief."

WASHINGTON, Feb. 9, 1887.

John S. Mosby.

guarded the Monocacy Bridge, which was barricaded. You will, of course, take charge of Jenkins's brigade and give him necessary instructions. All supplies taken in Maryland must be by authorized staff-officers for their respective departments, by no one else. They will be paid for or receipts for the same given to the owners. I will send you a general order on this subject, which I wish you to see is strictly complied with. I am, very respectfully, your obedient servant, R. E. LEE, General."

On the following day General Lee wrote as follows: "HEADQUARTERS, ARMY OF NORTHERN VIRGINIA, June 23d, 1863, 5 P. M. MAJOR-GENERAL J. E. B. STUART, Commanding Cavalry. GENERAL: Your notes of 9 and 10:30 A. M. to-day have just been received. . . . If General Hooker's army remains inactive you can leave two brigades to watch him and withdraw with the three others, but should he not appear to be moving northward, I think you had better withdraw this side of the mountain to-morrow night, cross at Shepherdstown next day and move over to Fredericktown. You will, however, be able to judge whether you can pass around their army without hindrance, doing them all the damage you can, and cross the river east of the mountains. In either case, after crossing the river, you must move on and feel the right of Ewell's troops, collecting information, provisions, etc. Give instructions to the commander of the brigades left behind to watch the flank and rear of the army and (in event of the enemy leaving their front) retire from the mountains west of the Shenandoah, leaving sufficient pickets to guard the passes, and bringing everything clean along the valley, closing upon the rear of the army. As regards the movements of the two brigades of the enemy moving toward Warrenton, the commander of the brigades to be left in the mountains must do what he can to counteract them; but I think the sooner you cross into Maryland, after to-morrow, the better. The movements of Ewell's corps are as stated in my former letter. Hill's first division will reach the Potomac to-day, and Longstreet will follow to-morrow. Be watchful and circumspect in all your movements. I am very respectfully and truly yours, R. E. LEE, General."

TOPICS OF THE TIME.

Executive Responsibility.

IN this centennial year since the framing of the Federal Constitution—"the most wonderful work," as Gladstone has styled it, "ever struck off at a given time by the brain and purpose of man"—nothing could be more timely and fortunate than the occurrence of incidents in the administration of the government which pointedly demonstrate the wisdom of its distribution of powers. The closing weeks of the Forty-ninth Congress were fruitful of such illustrations. Throughout its existence this body seemed strangely devoid of any sense of responsibility to the people. The Democrats controlled the popular branch, and their leaders in the House should have been prompt in responding to the wise suggestions of their President, especially in the urgent matter of reforming the tariff, and thus reducing the surplus. Democrats in each branch should have welcomed the opportunity to signalize the restoration of their party to power by a revival of its traditional principles, particularly those which restrict within proper limits the prerogatives of the general government, the undue enlargement of which was becoming a source of danger. The Republicans, as the minority, were not expected to attempt the initiation of any policy, but they were none the less bound because they were out of power to treat upon their merits questions which might arise, and to throw their influence in favor of economy and efficiency.

Each party violated its obligations to its constituents. With only a very few exceptions, the Republicans in the House twice cast their votes against even the consideration of a measure aiming at tariff reform; and, despite the most binding pledge of their party platforms, enough Democrats joined the minority on this point to make it a majority, and thus prevent any legislation to reduce the surplus. This pledge broken, there were found Democrats ready to violate still another by championing extravagant measures as a proper way of getting rid of the surplus. A House committee, of whose fifteen members nine were Democrats, reported a bill which came to be known as "the Pauper Pension Bill," and which, had it become a law, must inevitably have added tens of millions of dollars to the annual expenses of the government for a generation to come. This committee even had the assurance, when its course was challenged, to attempt justification by the demagogic plea that, from the standpoint of "money expediency" alone, "the surplus will be best restored to the people in the manner proposed by this bill," inasmuch as "no bonded interest or huge monopolies can claim it as their own," and "it will go among the people in small amounts and will be spent in their midst." The bill received the support of every Republican in the House and of enough Democrats to give it more than a two-thirds vote, while it passed the Senate without a division.

Meanwhile Congress had committed another piece of folly. A bill appropriating ten thousand dollars of

the money raised by taxation for the support of the general government to buy seeds for some farmers in Texas, who were in want through a long-continued drought, slipped through the House, and was passed by the Senate with its eyes open, eleven out of eighteen Democrats supporting it, although its grossly unconstitutional nature was forcibly pointed out by Mr. Hawley, of Connecticut, a Union soldier and a Republican, who has stoutly defended State rights more than once of late. Both these bills, bad in themselves and even worse as precedents, went to the President. Senators and representatives had thus done their part toward committing the country to one measure which would in all probability add hundreds of thousands of names to the pension roll, and to another which would help to overthrow the constitutional restrictions upon the powers of the Federal government. They had done this, too, without the slightest sense of personal responsibility being manifested by the overwhelming majority of those who had voted for the bills.

In his admirable exposition of the Constitution, which so wonderfully vindicates his prevision, Story points out that "unity in the Executive is favorable to energy, promptitude, and responsibility." After alluding to the bad effect of dividing the power among several persons, Story enforces this feature of superior responsibility in the single Executive. "His responsibility," he says, "is more direct and efficient, as his measures cannot be disguised, or shifted upon others; and any abuse of authority can be more clearly seen, and carefully watched, than when it is shared by numbers." Elsewhere, in vindicating the bestowal upon the President of a qualified negative on legislation through the veto, Story remarks that "the power is important, as an additional security against the enactment of rash, immature, and improper laws."

Story's language could not have fitted the case better if he had foreseen, half a century before, what was to happen in the year 1887. They were "rash, immature, and improper laws" which Congress had tried to enact, passed with scarcely a pretense of discussion in either branch. The responsibility for their passage was so "disguised" that any senator or representative could "shift upon others" his share. But when they went to the single Executive, the situation was immediately revolutionized. Now there was one man whose responsibility was "direct and efficient." The Pauper Pension Bill would become the law of the land, and commit the government permanently to a radical and unjustifiable departure in legislation regarding Union soldiers, unless within ten days after he received it the President should return it to Congress with his objections. The public appreciated the exigency, and the press appealed to the President for a veto. Union soldiers of high character and standing, hostile to the bill, who would have despaired of affecting either the Senate or the House, where abuse of authority was "shared by numbers," wrote to the Executive with assurance that their words would be duly weighed. For days the

attention of the country was fixed upon the incumbent of the White House, and he was made to realize that, if the bill should become a law, the country would hold him alone more responsible than both branches of Congress together.

Primarily, of course, it is to the Constitution, which created a single Executive and invested him with a qualified negative upon legislation, that we owe our escape from the Pauper Pension Bill folly and from the vicious Texas Seed Bill precedent, for without these provisions the measures would inevitably have become laws. But the constitutional possibility of thus defeating the schemes would have been of no avail if the man who enjoyed this power had not employed it. The President of the United States as an official possessed the prerogative of vetoing the bills, but it was Grover Cleveland the man who exercised a veto power which the President of the United States need not have employed, and which many another man in the place would not have employed.

In concluding his discussion of the Executive department, Story declares his conviction that "it will be found impossible to withhold from this part of the Constitution a tribute of profound respect, if not of the liveliest admiration," but he adds that in order to realize public expectation it is essential that the man who occupies the office be "one who shall forget his own interests and remember that he represents, not a party, but the whole nation." If he had consulted his own interests in a narrow personal sense, Mr. Cleveland would have signed the pension bill. It is notorious that self-interest was a potent motive with the average senator and representative who supported it. "The soldier vote" was supposed to be behind the measure, and in all the States north of the Potomac only three congressmen out of both parties in both Houses were recorded against it. As the representative of a party solely, Mr. Cleveland would have signed the bill. Democratic congressmen insisted that a veto would hurt the prospects of the Democracy in Indiana and other close States where it wants to gain votes.

But Mr. Cleveland examined the bill with great care, and became convinced that it was a thoroughly bad measure. He perceived that "the race after the pensions offered by this bill would not only stimulate weakness and pretended incapacity for labor, but put a further premium on dishonesty and mendacity." He believed that "the probable increase of expense would be almost appalling." He held that the measure would "have the effect of disappointing the expectation of the people, and their desire and hope for relief from war taxation in time of peace." He concluded that the interests of the whole nation required him to withhold his approval.

The Texas Seed Bill called for no such display of moral courage as the pension issue, but it offered an opportunity, no less striking, for enforcing a similar lesson, which Mr. Cleveland is to be commended for improving. The pension bill proposed to assist, through the Federal government, those old soldiers in the North "who are willing to be objects of simple charity and to gain a place upon the pension roll through alleged dependence." The seed bill proposed to relieve, through the Federal government, some suffering farmers in a Southern State. It was more than a chance coincidence that the two bills were in the President's

hands at the same time. They represented a long-growing tendency, which was fast coming to pervade both sections of the country, and which needed to be reprobated in a way that would impress both sections. The twin vetoes served this purpose almost ideally. Their force was strengthened by Mr. Cleveland's use in the later message of a most telling phrase, one destined to a long and useful life: "The lesson should be constantly enforced that, *though the people support the government, the government should not support the people.*"

Mr. Cleveland has made some unpardonable errors and committed some grievous faults since he became President, but he has gone far to atone for them by the manly way in which he met the responsibility that a demagogic Congress devolved upon him in these measures of legislation. The great danger which threatened this nation when Congress met for its last session was the drift toward paternalism, the disposition to seek aid from the Federal treasury, the decay of the ancient American spirit of self-reliance. That this danger has already so largely vanished is due chiefly to Mr. Cleveland's wise and courageous use of the veto power in behalf of what he so well calls "the sturdiness of our national character."

The Nation's Recent Debt to the South.

THE North fought to save the Union because it believed that it would be better for all the States, South and North alike, that they should continue for all time one nation. The Union was preserved, and for years its members have again stood upon an equality in the government of the country. Southern men who vainly sought by force of arms to establish the right of secession have sat in Congress beside Northern men who shared in overthrowing that claim on the field of battle. They have voted together for generous pensions to soldiers of the Union army, and an ex-officer of the Confederate service now presides over the Executive Department which includes the Pension Bureau, while the present head of that Bureau was an officer on the Union side.

The vote in the House on passing the Pauper Pension Bill over the veto brought into strong relief the advantage which the North already reaps from having the South back in the Union. While the measure was in the President's hands, many old Union soldiers, Republicans as well as Democrats, besought him to disapprove it. "It originated with claim agents and professional pension-seekers," wrote a western Massachusetts veteran, "and is not the cry or plea of the great body of veterans." "I constantly meet with soldiers, privates as well as officers, who repel with deep feeling the assumption that they desire more money in return for the purely patriotic service they gave the country," wrote General J. D. Cox, of Ohio, a Republican ex-governor, in urging Mr. Cleveland not to approve the bill. "I think the President justified in vetoing such a bill as this," said General Joshua L. Chamberlain, of Maine, another Republican ex-governor, "and believe he will be supported by the sentiment of the country." No candid person who watched the expression of public opinion can doubt that the President's course in this matter was approved by the sober

second thought of the North, including the great mass of self-respecting and self-reliant veterans themselves.

The President was not only "supported by the sentiment of the country," as General Chamberlain predicted he would be, but his veto was sustained by Congress. It was, however, only through the votes of "the States lately in rebellion" that the action of Congress was made to conform with the sentiment of the country. This is rendered plain at a glance by the following summary of the vote on passing the bill over the veto:

	Yeas.	Nays
From the eleven seceding States	7	71
From the rest of the country	168	54
Total vote	175	125

In other words, if the question whether the President's veto should stand had been submitted to the representatives of those States only which adhered to the Union, Mr. Cleveland would have been overruled, more than three to one, and a bill would have become a law which, in the opinion of such a Union soldier as General Chamberlain, "offers an incentive to fraudulent claims, which degrade the deserving, and to too ready a resort to a plea of dependency, demoralizing to manliness." That there were cast on the right side twenty-four more votes than were necessary to sustain the veto was due to the fact that the States which sought to secede from the Union joined in deciding the issue. "The only cry they [the great body of veterans] have now," said the western Massachusetts soldier from whose letter to the President we have quoted, "is that you will spare them the honor of having served their country because they loved her, and not as mere bounty and pension seekers." That honor has been spared the Northern soldiers, but only through the help of Southern representatives, many of whom fought against them a quarter of a century ago.

In a broad and elevated view it may well be doubted whether history has ever recorded a sweeter triumph for the victors in a righteous cause than men like General Cox and General Chamberlain have thus lived to witness. They fought to keep the South in the Union, and they have survived to see the honor of the Northern soldier preserved from the taint which demagogues and claim-agents would have cast upon it through the votes of the Southern men in Congress.

Looking back over the history of the nation, we can now see that the civil war was inescapable. The view of the Constitution in which the South had been educated rendered an attempt at secession inevitable, and as Webster said in his famous 7th of March speech, "peaceable secession is an utter impossibility." Or, as Lincoln put it in his second inaugural: "Both parties deprecated war; but one of them would make war rather than let the nation survive; and the other would accept war rather than let it perish." That the time would come when the South would rejoice that the war ended as it did, and when the North would find itself indebted to the South for efficient help in securing the good government of the reunited nation, was also inevitable; but it might well have been expected that it would not come till after the generation which fought the war had passed from the stage. Less than a quarter of a century, however, has sufficed. The New South frankly confesses its satisfaction with the issue

of the struggle for secession; the New North has now been brought to realize its indebtedness to the South for indispensable help in maintaining good government. Such champions of the Union cause twenty-five years ago as General Bragg of Wisconsin, Colonel Morrison of Illinois, General Warner of Ohio, and Mr. Curtin, the "War Governor" of Pennsylvania, spoke in defense of the President's veto during the debate in the House, and at its conclusion the veto was sustained, in part through the votes given by men like them from the North, but chiefly through the votes of men who came from the States which once sought to disrupt the Union. Fair-minded Northern men thus see that they owe to the South this arrest of the pension craze and of the alarming drift toward paternalism which the Pauper Pension Bill typified. The confession of this indebtedness is the epitaph upon the grave of sectionalism in American politics.

The Problem of Government by Guilds.

AN "Open Letter," on another page, grapples with the problem of municipal reform in a courageous fashion. It is not to be wondered at that thoughtful men, confronting the extravagances and abuses that seem to have intrenched themselves in most of our city governments, and observing that the dispersion of one swarm of the vermin that infest our city-halls and court-houses only makes room for another and hungrier swarm, should be reaching out after some radical reforms in the methods of government. They are not at all mistaken in supposing that the case is becoming critical; they are justified in bestowing upon it patient and anxious thought. The typical citizen is too much inclined to exult over the material gains of a "triumphant democracy," and to ignore the chronic villainy of his city government.

It is a little curious that this New York merchant, pondering the question of municipal government, should have hit upon the same device as that which the great German philosopher, Hermann Lotze, has been proposing. Lotze deplores the haste and passion with which "the antiquated forms of companies, guilds, and corporations" were swept away in the rush of the revolutionary movements that ushered in "the modern era," and declares that they ought to have been transformed, not abolished. The most essential fault of modern society is, he declares, "its low estimation of the corporate element." "Of course," he argues, "we do not want to go back to corporations for the subsistence of which we can find no even plausible reason, in order to accumulate privileges for which there is still less any conceivable rightful claim; but on the one hand, a living bond between those who are really connected would maintain the discipline which we so greatly need, but which yet we cannot enforce by means of general laws; on the other hand, such combinations, representing partly the most important callings (agriculture, manufactures, commerce, art, and science), partly the special local interests of different districts,—would form the true unities, the representatives of which, by equilibration of the interests of each, would cover the wants of the whole."

Can it be true that the mediæval communities held, in these ancient craft-guilds and fraternities, a form of social organization which it was unwise to destroy, and to which we would do well to return? Wise or unwise,

their destruction was inevitable. Not merely for the economical reason that they obstructed the free movement of labor from one occupation to another, but still more for the political reason that they furnished no soil in which the sentiment of nationality could take root, they must have been abolished. The "notion of a citizen of the State," of which Lotze speaks rather slightly, but which is the one great conception of modern times, needed to be planted and nurtured in the minds of men. When the member of the guild found himself the citizen of the State, his horizon was widened, and his thoughts were enlarged. There was reason then, underneath the rashness and passion which Lotze deplures, and by which the guilds were destroyed. Reason there almost always is, even in the blind fury of the populace. Wickliffe denounced the guilds, and Bacon stigmatized them as "fraternities of evil." It was the *Zeit Geist* who said that they must go, and they went. But it is not at all certain that they may not return. Many customs, fashions, social forms have been pushed aside by one age and taken up by another. The organization of government by guilds was obstructive to liberty five hundred years ago, but it might be conservative of liberty to-day. At any rate the proposition is worth considering.

Two of the reasons urged by our correspondent for this reform seem to be cogent. That it would break the connection between municipal government and national politics, and that it would give all classes of the people a voice in the municipal government, seems probable. Both these results are greatly to be desired. The root of most of the evils of city government is in partisan politics and in the mischiefs which either accompany or flow therefrom. It is doubtful whether city politics will ever be permanently divorced from national politics unless some such radical reorganization as is here suggested can be effected; and it is pretty certain that until municipal government can be separated from national politics, the vilest elements of our cities will generally bear rule. Doubtless under the plan proposed, the machine politicians would make strenuous attempts to capture the several guilds; nevertheless the desire of each guild to be represented by its ablest men, and to secure by this means the protection of its own interests, would greatly interfere with the schemes of the office-seekers.

The other result promised — the fair representation of every class of citizens in the city government — is equally desirable, and under such a plan it would probably be secured. The enormous preponderance of some classes in our municipal councils is now notorious; and there are large classes, and these the most intelligent and capable of government, that are now rarely represented in these councils. Any scheme which would bring them into an active participation in the management of municipal affairs deserves to be patiently studied.

It is almost certain that a city council, chosen according to this plan, would be incomparably superior, intellectually and morally, to those which are usually found in our council chambers.

Several practical difficulties suggest themselves. The classification of the voters might not be easily accomplished. In the smaller cities, especially, it would not be possible to give to each separate trade its representatives, for the number of trades and professions is

great, and the number of those practicing some of these trades and professions is small. It would be necessary, therefore, to combine those of several different, though related, vocations into one guild — as, for example, the metal-workers might include blacksmiths, tinsmiths, boiler-makers, etc.; and the guild of instruction the clergy, the teachers, the authors, etc. The arrangement of these classes would be attended with some difficulty; nevertheless, the problem is not hopeless.

The serious question is whether the representatives of these guilds would act unitedly for the public welfare, or whether their devotion to the interests of their several classes would not lead them to sacrifice the interests of society. Would the feeling that Lotze curiously deprecates, the sentiment of loyalty to the state or the municipality, be strong enough to hold in check the class feeling to which the system makes direct appeal? Could these representatives of guilds and classes agree together to promote the general good of the community? The danger would be that those who now give up to party what was meant for mankind would then make the same debasing surrender to the interests of their guild. The misery of that state into which we are now fallen results from the fact that public spirit is overborne by private greed and party passion; would not the same causes continue to operate under every possible form of political organization? In a government by guilds the obvious method by which these evil tendencies could find expression would be the device that is known among the politicians as log-rolling. There might be combinations among guilds, by which some would help others and receive help in return, at the expense of the rest. It is scarcely necessary to say that this kind of abuse is prevalent under existing conditions. Everybody knows the way in which appropriations for internal improvements are secured in Congress and the way in which the tariff is adjusted. Something of the same nature often occurs in municipal governments. There is log-rolling in the interest of wards, as well as of States and sections. The only question is whether this organization of government by guilds would not foster these corrupt and selfish methods. Obviously, the guilds whose numbers would be largest and whose interests are most closely related — the various guilds of wage-laborers — might, by combination, control the government. It is possible that they could do as much now, if they knew their power, and there are signs of such an issue; but the adoption of the scheme which we are considering would offer new facilities for an enterprise of this nature.

Under any form of political organization selfish men will behave selfishly; but there are some political methods that offer larger opportunity and more encouragement than others for the exercise of the virtues of public spirit and patriotism; and the question to be determined is whether the organization by guilds would have this effect. Some of the more obvious objections have been suggested above, rather for the sake of eliciting discussion than with the design of pronouncing against the measure. In fact, the discussion of any branch of this subject cannot fail to do good, as it will call attention to the crying evils that exist. But there is a more immediate and practical reform now "in sight," which we shall discuss in a future number.

Food.

Few of those who toil for moderate returns will take exception to Mr. Edward Atkinson's conclusion, that half the cost of living is the price of materials for food; their grocers and butchers have long since convinced them of that. But the reader who prides himself upon sometimes being thoughtful must be able to recall certain discouraging moments in his early housekeeping days, when ignorance of the laws of nutrition and the economy of foods had led him into extravagance and waste; perhaps he is quite aware that ignorance and extravagance and waste followed his purchases home to his kitchen and his table, and there became not only a drain upon his modest purse but a sapper of his health and vitality. Very probably, too, he in time ceased to grow thoughtful over the subject, and continued to walk the path his ignorance trod out. There seemed no other path. Now make our supposed buyer not a reader, and not thoughtful, and only a common laborer, his purse not merely modest, but well nigh empty, and you have come face to face with the portentous problem of the hour.

Some one has, in effect, said that certain forms of religious doctrine bore thorns and bitter fruit, and not rose leaves and sweetness, for the simple reason that their founders' digestive organs were impaired. We

may neither agree nor disagree with this, but if we were to become prophetic, and were to call it a truth of coming generations, that our civilization came to its downfall through the neglect of its wise men to teach its poor how to *live*, we would not be treading entirely upon air. For what can we expect in the future from the sons and daughters of men and women who starve while we in ignorance lay waste the fruits of the earth? We are glad to know of the site of ancient Troy and the presence of sodium in the stars, but to make plenty where want now cries for bread, to teach the poor to live well on the half of what they now starve upon, to shame anarchy with universal sweet bread and strength-giving foods,—we might with advantage barter many of our boasted wonders for this.

No one has gone so far upon this road as Professor Atwater, of the Wesleyan University, Middletown, whose series on "The Chemistry of Foods and Nutrition" is begun in this number. He has studied food and nutrition as no other student in this country has studied it. He has had one of the rewards of patient endeavor, inasmuch as his success is beyond all question. What he has found no one can afford to ignore. His discoveries are like the discovery of a new food-producing earth, since he can teach us to double the value of this.

OPEN LETTERS.

City Government by Guilds.

WHAT is the cause of the failure of municipal government in our larger cities? It is useless to disguise the fact that it has failed. In most of the cities government is becoming corrupt, inefficient, burdensome to an intolerable degree. It cannot be that the majority of the people wish to have it so. Doubtless the root of the evil is the indifference and neglect of the honest citizens; yet the question arises whether the present forms of municipal organization do not discourage and prevent the active participation of the best citizens, and whether other methods might not secure this desirable result.

Our present methods of nomination for office were devised when we were a rural people, and they still answer very well for that portion of our population. But we are rapidly changing the character of our social life, and concentrating our population in commercial and industrial centers; and these social changes make a change in our political methods indispensable.

If the political unit of a democratic government must always be a geographical one, and if we must always vote by wards or districts for municipal officers, then the voters are almost certain to range themselves according to party lines, and national politics will complicate and disturb municipal elections.

Is there not a better way? Would it not be possible to group the people of New York by occupations, and allow them then, by guilds, to elect their representatives to the city council? Some of our citizens have now their trades-unions. Might not the whole city be organized into trades-unions, to each of which representation

in the city government should be allowed in proportion to its membership?

The census enumerates the males of lawful age according to their vocation. These might be grouped into one hundred guilds, more or less, and each allowed one or two or three representatives in a city council, which council should elect a mayor with full power to appoint and remove heads of departments. This council should also make appropriations and frame city ordinances. There should be a guild hall, where all elections should be held. Each guild should have allotted to it one or two days in the year for its meetings and one day for its election. If the membership were so large as to cause delay at a single ballot-box, the list of members might be divided alphabetically,—A to G; — H to N, etc.,—and thus several ballot-boxes might be brought into use. The records of each guild could be kept at the guild hall. Each guild should control its own membership and canvass its own elections.

It seems to me that such a method of electing a city government would shut out partisanship, and give to the very lowest classes an opportunity not now enjoyed to exercise their right of suffrage intelligently. Can we expect a man who cannot read to judge wisely of the qualifications of the candidates nominated for the office of mayor? He does know his fellows, and of his companions he can select the best. Have we not expected too much of our humble voters? Could not a man see one step ahead of him who could not see from the bottom to the top of the political ladder?

This method of voting would emancipate the lower classes from the domination of professional politicians.

The 'longshoremen would no longer be mere retainers of some shyster lawyer or rum-seller, but would have the privilege and the duty of selecting one or more of their own class to represent their craft and its interests. The entire guild would watch the official course and conduct of its representatives and hold them to account. But what, in the meantime, has become of their quondam leader, the lawyer? He has retired to his own guild and dropped to the bottom, helpless and harmless. The rum-seller, too, in his own guild would have a voice in the selection of one of its members to represent its interests; but never more could that fraternity alone have the whole city council under its control.

A man's associates, whether he is professional man, merchant, or artisan, are more likely to know what his qualifications are than are his neighbors, residing in the same ward. The voter in the city knows very few of his neighbors. Geographical divisions are, therefore, purely artificial; it would be better to sweep them away, and substitute for them the existing lines of social organization. In a word, let us take men as we find them, already harnessed in business or occupation, and require them thus grouped to perform their political duties, instead of calling on them once a year on election day to break ranks, scatter, and vote as a mob.

John D. Cutler.

NEW YORK, Feb. 5th, 1887.

Toynbee Hall, London.

AN INTERESTING SOCIAL EXPERIMENT.

ONE of the most interesting features of London of to-day is the work of the "West End" among the poor of the "East End," and chiefly in this the University settlement housed at Toynbee Hall, Commercial Road, Whitechapel, next to that center of working religion, St. Jude's Church. The Rev. Samuel A. Barnett, rector of St. Jude's, whose name is known to all students of charity organization, is also senior warden of Toynbee Hall, and his assistant, the Rev. T. C. Gardiner, is sub-warden. With them are fifteen or twenty men, most of them graduates of Oxford or Cambridge, some of them busy in the city, others men of leisure and wealth,—all of them giving more or less of their time to the work of making the lives of the East End poor more wholesome and beautiful than they could be without such help.

The hall is named after Arnold Toynbee, one of the scholars of Balliol College, Oxford, who had interested himself deeply in social questions, and through whose efforts in great part the Coöperative Congress was invited to Oxford in 1881. He was a reader in political economy in his college and its bursar or business man, so that he had both a theoretical and practical knowledge of economics, and his interest in the subject was therefore two-sided. When Henry George's lectures attracted so much attention in England, Toynbee thought that some features or results of them should be counteracted, and he therefore arranged to give two lectures at St. Andrew's Hall, London, in which he discussed the betterment of the condition of the working classes from his point of view. The audience, I was told, was a curiously mixed one, containing a good many from the social stratum to which Toynbee belonged, as well as the

workingmen hearers whom he particularly invited; and among the latter there was a decided undercurrent of criticism and not a little interpellation of the speaker. In the course of the lectures he had confessed that his own class was largely responsible for the discontent among the working classes, and he said frankly that the evil would not come to an end until "we" were willing to live for and if necessary to die for "you." He was frail; the lectures had excited him greatly; and at the close of the last he fell back in his chair fainting. He was taken to the house of friends in the country, and there died. His sudden end threw a halo of pathos upon his lectures and his work, and when the University men decided to start this colony in London the buildings became a memorial to him. His family is well known in London for its devotion to philanthropic work, and several of his brothers and sisters are still active in the work to which he gave his life.

Toynbee Hall had its actual origin in Oxford. In the spring of 1884, a few months after Toynbee's death, Mr. Barnett read a paper at a small meeting in St. John's College, in which he shadowed forth his idea of what a colony of University men might do for industrial centers such as East London. The paper, though read to a small knot of men, was published and soon won its way, and a small group of University men made an experiment in associated life at a disused public-house, under Mr. Barnett's guidance and help, when the success of the experiment justified a permanent home. The friends of Arnold Toynbee, who had been anxious to erect some memorial of his work and enthusiastic self-devotion, provided most of the funds for a lecture-hall, and the cost of the rest of the buildings was defrayed by a company formed for this purpose, which raised about £10,000 on the security of the freehold land, bearing interest at 4½ per cent. Toynbee Hall, while a memorial to Arnold Toynbee, is also a monument to Samuel A. Barnett, whose ideas it embodies.

One enters from the Commercial Road through the ordinary English gateway into a sort of quadrangle, on one side of which is the residence part of Toynbee Hall, and on the other a lecture-hall which is filled nearly every evening for some purpose or other with East End people. This latter building is also used as a general headquarters for organized charity in the district, including, for instance, the office of the Beaumont Trust, from which the People's Palace, prophesied in Kingsley's "Alton Locke," and made almost real in Walter Besant's "All Sorts and Conditions of Men," is now rising into solid fact. The East London Antiquarian Society, the Adam Smith Club, the Toynbee Natural History Society, the Education Reform League, the Pupil Teachers' Debating Society, the Toynbee Shakespeare Club, the Students' Union, and still other organizations, hold their meetings in Toynbee Hall or in St. Jude's school next door. The hall is as beautiful a club-house as one would wish at the West End itself, and certainly no more charming host could be found through Belgravia and Mayfair than the junior warden. Each man has his room or suite of rooms, as he would have at college, and the charming drawing-room, with comfortable and cozy furniture and beautiful adornments, forms a general gathering-place for the club-men and their guests. We had "afternoon tea" there, in strange contrast with the surroundings of poverty and squalor in the

streets about, and here Mr. Gardiner told us something of the practical work of the colony and its difficulties.

Four evenings of the week are devoted, in the lecture-room opposite, to courses of lectures respectively on history, physiology, astronomy, and English Literature, the fee being one shilling for each complete course. Another evening there is a concert, and always on Saturday evening a "popular" lecture. The sixth evening of the week is given to a social reception in the drawing-room of the club-house, where the men of Toynbee Hall are assisted by friends from the West End in receiving and entertaining the poor people of the neighborhood. The difficulties of mingling classes are, after all, much the same in England as at home. There is a good deal of human nature everywhere. I asked Mr. Gardiner what kind of people proved the best entertainers. He replied that those who were popular at the West End were popular at the East, and there was, indeed, great difficulty in getting the right sort of people, because they were so much in demand in their own class of "society." Some practiced "entertainers," as they call them, could interest easily eight or ten of the poorer people, whereas others could take care of only one or two. The chief difficulty to overcome was the narrow sphere in which the poorer people did their thinking and their talking, and the whole purpose of these receptions, and of much of the other work, was to broaden the mental horizon of these people, and give them more and pleasanter things to think and talk about outside of the narrow circle of their tenement-house or neighborhood gossip. These men were hoping to accomplish much through the "national teachers,"—young men and women selected from the ranks of trades-people and the like, without much culture themselves, but who could be made the means of spreading the wider life among their pupils when they came to teach. To this end they organized reading-parties, as was the fashion at the universities, for those who showed special interest in the weekly lectures, and one or two of their best outdoor men were charged with forming cricket and tennis clubs and other outdoor circles, to broaden the life of their *protégés* in those directions.

The classes and reading-parties are organized into groups, each under the management of an Honorary (unpaid) Secretary. One group comprises one class studying the Old Testament, another studying moral philosophy, a course of Sunday afternoon lectures on the Ethics of the Ancient and Modern World, three classes in Victorian literature (one entirely of women), one in English history, two in political economy. A second group includes reading-parties on Mazzini, Ruskin, and literature, to each of which admission is by election, and classes in French, German, and Latin. Another group covers the physical sciences and includes an ambulance class. A fourth comprises singing-classes, instruction and entertainment for deaf and dumb, drawing-classes, elementary evening classes for boys, lantern illustrations in geography for boys, musical drill for boys, and several classes in short-hand. A fifth provides instruction and practice in carpentering, in wood-carving and in modeling, both for boys and men.

The work of Toynbee Hall is in the right direction, and, moreover, it is justified not only by its results but

by the enjoyment which men have in the doing of it. "I could not give up this East End work," said one of them to me; "I could not live my life in content away from the people I have learned to know and love here."

Notes.

LINCOLN AND EMERSON.

BEFORE our editorial in the April CENTURY on "Lincoln and Lowell" was published, Mr. Lowell had added another to his sayings concerning the martyr President, in his speech at Chicago on the evening of Washington's Birthday, in which he referred to Lincoln as, "on the whole, the most remarkable statesman of all times."

In this connection it should be noted that while Emerson did not write in verse of Lincoln, yet in prose he divides with Lowell the honor of early appreciation and fortunate characterization. In "Miscellanies" will be found an essay entitled "American Civilization," which, according to a note by Mr. Cabot, is "part of a lecture delivered at Washington, January 31st, 1862, it is said, in the presence of President Lincoln and some of his Cabinet, some months before the issuing of the Emancipation Proclamation." Mr. Lincoln may have been present, but his secretaries have no memorandum showing the fact, and the Washington papers of the next day throw no light on the subject: in fact, Mr. Emerson's son now believes that Lincoln was probably not present. The lecturer praised the "angelic virtue" of the Administration, but urged emancipation; and at the close of this essay, as printed, is a supplement commending the President for his proposal "to Congress that the Government shall coöperate with any State that shall enact a gradual abolishment of slavery." Next comes his address on the Emancipation Proclamation, in which the President is greatly praised for his moderation, fairness of mind, reticence, and firmness. "All these," Emerson says, "have bespoken such favor to the act, that, great as the popularity of the President has been, we are beginning to think that we have underestimated the capacity and virtue which the Divine Providence has made an instrument of benefit so vast. He has been permitted to do more for America than any other American man," etc. After this, in the same volume, comes Emerson's brief but memorable essay on the death of Lincoln, in which he says: "He is the true history of the American people in his time. Step by step he walked before them; slow with their slowness, quickening his march by theirs, the true representative of this continent; an entirely public man; father of his country, the pulse of twenty millions throbbing in his heart, the thought of their minds articulated by his tongue."

Again, in the essay on "Eloquence" ("Essays and Social Aims"), Emerson praises the Gettysburg speech, and in the essay on "Greatness" in the same volume he gives Lincoln as an example of the "great style of hero" who "draws equally all classes": "His heart was as great as the world, but there was no room in it to hold the memory of a wrong."

SINCE the publication of the reference to the death of Black Hawk given in the "Life of Lincoln," in the December CENTURY, the authors have learned that Black Hawk was not buried on the bank of the Mississippi, as certain authorities have stated, but on the Des Moines river, and without unusual honors.

BRIC-À-BRAC.

The Agile Sonneteer.

HOW facile 'tis to frame the sonnet! See:
An "apt alliteration" at the start;
Phrase fanciful, turned t'other-end-to with art;
And then a rhyme makes 1st and 4th agree.

Ec words enough,—so this next quatrain we
Will therefore rhyme to match. Here sometimes
"heart"

Comes in, as "hot" or "throbbing," to impart
A tang of sentiment to our idee.

Then the sextette, wherein there strictly ought
To be a kind of winding up of things;
Only two rhymes (to have it nicely wrought),

On which it settles, lark-like, as it sings.
And so 'tis perfect, head and tail and wings.
"Lacks something?" Oh, as usual, but a thought.

Anthony Morehead.

Wait a Bit.

WHEN Johnny came a-courting,
I thought him overbold,
For I was but a young thing,
And he no' very old.
And though I liked him well enough,
I sent him on his way,
With, "Wait a bit, bide a bit,
Wait a week and a day!"

When Johnny passed me in the lane,
And pleaded for a kiss,
And vowed he'd love me evermore
For granting of the bliss;
Although I'd liked it ower well,
I ran from him away,
With, "Wait a bit, bide a bit,
Wait a week and a day!"

When Johnny fell a-ranting,
With, "Jenny, be my wife?"
And vowed I never should regret,
However long my life;
Although I liked it best o' all,
I turned from him away,
With, "Wait a bit, bide a bit,
Wait a week and a day!"

Oh, Johnny was a ninny,
He took me at my word!
And he was courting another,
The next thing that I heard.
Oh, what a ninny was Johnny,
To mind me when I'd say,
"Wait a bit, bide a bit,
Wait a week and a day!"

Heigh-ho, I've met my Johnny,
I gin him a blink o' my eye,
And then he fell a-raving,
For want o' my love he'd die!
I ne'er could be so cruel,
So I set the wedding-day,
With, "Haste a bit, nor waste a bit,
There's danger in delay!"

Jennie E. T. Dowe.

The April-Face; or, The Stub-tailed Mule.

(AN IDYL OF A RICHMOND STREET-CAR.)

ALL up the street at a stately pace
The maiden came with her April-face,
And the roses I'd paid for,—upon her breast,
Were white as the eggs in a partridge-nest,
While behind her—the driver upon his stool—
Tinkled the bell of the street-car mule.

"Going to walk up the street?" I said;
She graciously bowed her beautiful head.
"Then I'll walk too; 't's a lovely day"—
Thus I opened the ball in my usual way.
"Do you see the car behind?" inquired
The April-face, "I'm a trifle tired."

I urged a walk; 'twas a useless suit!
She gently waved her parachute;
The stub-tailed mule stopped quick enow;
I handed her in with a stately bow.
And the bell rang out with a jangled quirk,
As the stub-tailed mule went off with a jerk.

Three men as she entered solemnly rose,
And quietly trampled their neighbors' toes;
A dudish masher left his place,
And edged near the girl with the April-face,
Who sat on the side you'd call "the lee"
(With the same sweet smile she'd sat on me).

The day was lovely; mild the air;
The sky like the maiden's face was fair;
The car was full, and a trifle stale
(Attached to the mule with the stubby tail);
Yet the maiden preferred the seat she hired
To the stroll with me; for I made her tired.

And now when the maiden walks the street
With another's flowers, and a smile so sweet,
I wave to the driver upon his stool,
And stop the stub-tailed street-car mule,
While I purchase a seat with half my pelf;
For it makes me a trifle tired myself.

No. 2.

PETER BORO.

IN the eastern part of England the Normans built three great sister churches, similar in dimensions and design. All three are now cathedral churches,—Norwich near the coast, Ely in the center of the fenlands, and Peterborough on their western skirts. It has been hard to choose two of them for comment and pass by the third; and it may seem strange to pass by the one which more entirely than the others—indeed, more entirely than any cathedral in the country—keeps its pristine form.

Norwich keeps unaltered that Norman ground-plan which everywhere else has been conspicuously changed; keeps all the lower parts of its interior as originally built, and keeps its splendid central tower. But this very freedom from mutations has made it in one way less interesting than its rivals, and in one way less characteristic too. The variety which comes from the touch of successive generations, from the contrasting beauty of successive styles, seems more interesting than unity to all eyes save the serious student's. And it was so often wrought in the cathedrals of England that it is one of the chief characteristics which oppose them to their fellows elsewhere. Peterborough and Ely have diverser charms, a richer historic voice, and a more

typical interest than Norwich, because their features are much more variously dated.

And then, while almost every important part of Norwich will be found in prototype along our path, Peterborough has, and Ely has, a splendid feature which is all its own. Did we not see the octagon at Ely, or did we not see Peterborough's western front, we should miss one of the loveliest, most daring, most original creations of the English builder, and one which he never even tried to match elsewhere.

I.

HISTORICAL claims imposed Canterbury upon us as our first cathedral; and were they consistently respected we should go next to York, or Winchester perhaps, or Durham. But the guiding-threads of interest are many and at times conflicting; and now the architectural strand may well be followed for a while.

Peterborough's history is devoid of wide significance. It was not a cathedral till long after its many-dated fabric was finished as we see it to-day; it stood apart from the main currents of national life; its influence, albeit great, was almost wholly local; and its annals are marked by few famous names or conspicuous happenings. But its fabric, though built as a mere abbey-church—a mere private place of worship for Benedictine monks—bears comparison with the very greatest. Its scheme gives proof of the enormous extent of monastic wealth and pride and power; and the very many dates which mark its execution prove

how long such influences were potently at work.

The Abbey, at first called Medeshamstede, was founded by Peada, the first Christian king of Mercia, less than sixty years after the landing of St. Augustine. Its church was finished by his successor and dedicated to St. Peter. The pope granted the brotherhood extraordinary privileges; the king endowed it with some four hundred square miles of land; and for two hundred and fifty years it lived and prospered greatly. But then its buildings were utterly swept away by Danish rovers, and their eighty-four indwellers were slaughtered to a man.

A full century passed ere, in 972, the monastery was refounded, reëndowed, and rechristened Peter's-borough. Edgar was then king, and Dunstan primate; and the Benedictines, whom they so greatly favored, were naturally placed in the new establishment.

This, the second church, was also troubled and laid under tribute by the Danes, though not destroyed. But the most interesting chapter in its history connects it with those later days when Danes and Englishmen joined in a last resistance to the Norman interloper and when Hereward ruled the "Camp of Refuge" in the neighboring Isle of Ely. Hereward's story, made so familiar by the touch of modern romance-writers, rests but upon long subsequent and dubious traditions. Yet their very survival and their richness of detail prove at least that he must have been a valiant leader and one whom the popular imagination held very dear. And our own mood grows so sympathetic when we read that we hardly care to ask for history's exact decisions. We like to believe in his midnight vigil at Peterborough's altar; and we are probably right in believing that a little later he came with his band of outlaws — monks, peasants, and soldiers, Englishmen and Danes — and despoiled that altar and the whole church of St. Peter, carrying off its treasures to prevent their falling into the grasp of the advancing Norman. Their guardians were inclined to favor Englishmen, not Normans; yet so high-handed an act could not fail to seem sacrilegious in their eyes, and they resisted it as best they might. Hereward burned their homes and drove them forth, but, it seems, without needless cruelty; for when William's fighting abbot came in his turn, he found the hospital still standing over the head of a single invalid old brother.

This Norman abbot, Thorold, chastised Peterborough as vigorously as William had expected. He ruled for twenty-eight years, "a master of the goods of the abbey and a scandal to the church." And, "being a soldier by choice and a monk for convenience and emolument," and knowing himself well hated within his own walls, he brought thither a troop of men-at-arms and built them a castle close by the church's side. When this castle was destroyed is not exactly known; but its site is traced in a mound called the Tout-hill, which rises, overshadowed by great trees, to the south of the cathedral and to the eastward of the bishop's — once the abbot's — palace.

In 1107 Ernulph, the prior of Canterbury, was promoted to be abbot at Peterborough. Later he was made bishop of Rochester, and in all times and places was a mighty and persistent builder. We have already seen the remnants of his work at Canterbury, and at

PLAN OF PETERBOROUGH CATHEDRAL. (SCALE 100 FEET TO 1 INCH.)

A. Portico. B. Western transept. C. Nave. D. D. Transept. E. Choir. F. Retro-choir or "New Building." 10. Place of Mary Stuart's tomb. 11. Tomb of Catherine of Aragon.

Rochester such still stand to day. But here he speaks only through tradition: the dormitory, the refectory, and the chapter-house he built have utterly disappeared.

II.

The second church stood unchanged by any Norman hand until 1116, when, like its predecessor, it was wholly swept away by fire. In 1117 the present structure was begun. John of Sals was abbot, but whom he had for architect we know not; nor are the later chronicles of Peterborough anywhere illumined by those citations of an artist's name which give Canterbury's such a vivid charm.

Under John of Sals the choir was built in part, and it seems to have been finished under Martin of Be : for he brought his monks into the new structure "with much pomp" in 1145, and a consecration implies at least the choir's completeness. The central tower was erected soon after 1155; and this in its turn implies that the transepts and a portion of the nave must have been standing to support it. And thereafter the work seems to have gone on slowly westward. Slight differences in construction and design mark its successive stages; but the same general scheme persists till we come almost to the western wall.

It is easy to see that more than once the original plan was altered for the increase of size and splendor. The nave had already been given two bays more than were at first intended before a second change of scheme added still another space, which, as it has a lateral projection beyond the main line of the aisle-walls, is called a western transept. In this the pure simple Norman style is no longer used, but a later, lighter, richer version of round-arched design,—that "transitional" style which served to prepare the way for

"pointed" fashions. And when we cross the threshold and look at the outside of the western wall, we see still another step in development. I do not mean when we look at that huge arched portico which our illustration shows, but at the veritable wall of the church behind it as seen on page 168. This shows only pointed arches, though its inner face is built with round. Evidently the great change of style had come about while it was being

WESTERN TOWERS OF THE CATHEDRAL FROM THE CLOISTERS.

raised; and its constructors, true to the spirit of their age, had abandoned the old manner as quickly as they could. For the "unity" of their work as a whole they did not care,—only for the harmony of such portions as a single glance might cover.

Their idea was evidently to build some such façade as we shall see at Wells and Salisbury, with tall towers on either hand and projecting buttresses in front. But ere the task was accomplished a new hand took control. Again the design was changed, and again for the sake of greater grandeur. One of the planned-for towers was finished no further than necessity compelled for the safety of the front; and the other, though now conspicuous with four corner pinnacles, is still much lower than it should have been. And the buttresses re-

mained unbuilt while another entire façade was thrown out, with the three majestic arches, the small flanking towers, and the windowed gables that we see to-day.

Many sins did its builder perpetrate in the working of his purpose. On the ground they can be very clearly understood, and here I may at least refer to them. For they show that the mediæval architect, even in the "best of periods," was sometimes led by purely æsthetic aims to sacrifice the stability, the rationality, and the "truth" of his constructions. And the lesson is interesting in view of Mr. Ruskin's dogma, that such sacrifice was first committed by Renaissance artists, and learned from them by modern men to our architectural undoing.

III.

To begin with, this "majestick front of columel work" does not sustain the outward thrust of the nave arcade as buttresses would have done, and as to the eye it purports to do. Its vaulted roof impinges upon the west wall, of course; but its tall clustered piers stand free, and unassisted could not even bear their own weight and the weight of their arches. Vast arches such as these may seem well able to support themselves, even though they rise eighty-one feet above the ground; may look like mammoth branching trees and seem to stand as a tree stands, by natural elasticity. But in truth their stones bear downward with as great a weight as though differently arranged,—or, more exactly, bear *outward* with enormous lateral pressure. Even assisted as they are by the towers on either hand, they have not really stood, in the true meaning of the word. Only a hundred and fifty years after they were built the western wall seems to have thrown too much weight upon them, its own towers suffering from the lack of buttresses. To counteract this danger there was raised within the central arch, up to half its height, that closed porch or parvise which, though charming in itself and very scientifically used, mars the harmony of the façade and spoils its grand

VIEW EASTWARD THROUGH THE GATE FROM THE MAIN DOOR OF THE CATHEDRAL.

simplicity. And to-day all the arches are conspicuously out of the perpendicular, though the whole fabric has been braced and tied together in ingenious ways; and some say that there is even a need that the entire work should be taken down for reconstruction.

And had it been solidity itself, it would still not have been a rational piece of work. It not only lacks structural affinity with the church, but deliberately misrepresents it to the eye. Professing with its three arches to express the three longitudinal divisions of the nave, it leads us to believe that the aisles lie some 65 feet apart, while in fact they are separated by a space of but 46. Nor, again, are the arches, like those of Rheims or Amiens, a true development and glorification of the doors that lie within them. They are independent in station as in structure, and have absorbed all the dignity they should have shared with the portals proper. It is a screen, this front, and not a true front or even a true portico; and a screen which bears false witness to the work behind it. Moreover, its general design, considered simply for itself, has been sacrificed to the preëminence of the arches. The gables

are too small and delicate to match with them, and the flanking towers too insignificant. In truth, no doors, no gables, and no towers could have been built to keep them fitting company. Given arches of this size, the rest of the composition could not but be made to suffer. Yet even thus, as writes our excellent local guide,* "it raises ideas which no building even of extraordinary size could adequately satisfy." Any possible interior would seem too small and low for its magnificent predictions. And do not these facts prove that it is not *rational*, as every architectural work should be, according to those theories and principles which it is always well to bear in mind? But he must be a pedant thrice over, who, when he stands face to face with Peterborough, *can* bear them in mind for its condemning. Gothic art would have been a thing far inferior to the thing it was had this been the normal way in which its great church-fronts were built, did this architect's practice translate its fundamental rules of composition and canons of construction. We are quite content that there should have been but one such architect, and that he should have built but one such façade—yet how glad that he did build this, abnormal, eccentric, even irrational though its beauty be! There is absolutely nothing like it elsewhere; and there are few things in any place, however superior in all that goes to make architecture *good* as well as entrancing and imposing, which can dare to rival it for majestic grace and almost supernatural effectiveness.

Strangely enough, not only the name of its constructor but even the name of the abbot who employed him is unknown. Nothing identifies or dates the fabric save the voice of its own Early-English style which points to the first half of the thirteenth century. Some believe that French genius must have been at work upon it; and it certainly bears more likeness to current French than to current English products. But I cannot quite think that any Frenchman, even away from home, would ever have designed in so unscholastic, so overfree a fashion. And the sculptured details are hardly rich enough to have been born of Gallic inspiration. It seems to me rather the work of some exceptionally brilliant Englishman, who had seen the great portals of France and had wished to surpass them, but who ended by producing something wholly new,—something superior to his models in audacity, in freshness of impulse, and in pictorial charm, but far inferior in good sense, in true architectural balance and harmony of design, and in decorative finish. A very great artist he must have been; but there were better architects alive in France. Had

Michael Angelo done his architectural work in the thirteenth century he might well have built some such a portico as this; and yet we do not even know the name or nationality of the ambitious, unfettered, reckless, but divinely gifted man who seems to have expressed himself once and for all at Peterborough.

IV.

STRANGE indeed is the contrast when we pass into the old Norman nave beneath this portico and through the "transitional" transept, with its slender pillars, its rich capitals, its arches—round, indeed, but light and graceful—its high vaulted roof, and its wealth of zigzag decoration. Strange, indeed, and well able to convince us that what we vaguely call "mediæval art" was not one art but many arts, of the most widely divergent details, features, and proportions, aiming at the most widely different ideals, and potent to suggest the most alien emotions.

Here is again beauty, truly, but neither the grace, the lightness, nor the aspiring lines which so splendidly show themselves outside; no elaboration of minor parts, as in the "transitional" work, and very little decoration. The plainly fluted capitals and the sparse zigzags of the arch-moldings give scarce a first faint prediction of that "cut work and crinkle-crinkle" which to old John Evelyn summed up the qualities of mediæval work.

This work is strong to massiveness, plain almost to baldness,—Titans' work, immense, austere, and awful. To the men of Evelyn's day, and also to the men of late mediæval days, it doubtless seemed barbaric. But it is not this, and it is not even primitive, archaic, though so tremendous, stern, and simple. It is too grand in its air for barbaric work which is never more than grandiose; too dignified; and too refined despite its lack of delicate detail. And it has the distinctly non-archaic quality of perfect self-possession,—that air of repose which always marks a complete and never a tentative stage of architectural development. It shows no trace that its builders were uncertain of just what they wished to do, or, if certain, were unable to achieve it. Primitive though it may look by contrast with richer, lighter structures, it is in truth the final perfected effort of a style which had known a growth of centuries' duration. It exactly and completely expresses the aims and ideals of its own race of builders.

It is true that we may think the nave far too narrow for its length. But this is a question for mere taste to settle. If the proportions of the ground-plan are out of keeping with our ideas of perfect beauty, the fact implies no

* Thomas Cradock: "A General, Architectural, and Monastic History of Peterborough Cathedral."

Wm. J. Stansell
Engraver

PETERBOROUGH CATHEDRAL — THE WEST FRONT.

such lack of skill in the management of the chosen forms and features as would a want of harmony and proportion in the construction proper. And though this construction might have been ornamented into richer charm, its *style*, I say, could not have been improved upon unless the designer's ideal had been altered too. Nor should we forget that the want of sculptured detail was once supplied by ornament in color, covering every part of the vast interior.

Mere theoretic judgment tells us this, and we see it clearly proved in the western transept. Here the fundamental forms are the same, but their proportions are all changed. Doubtless the result seems much more charming to most modern eyes; but it should be recognized as the result of *different aims*, and, moreover, of their incomplete attainment. Here lightness, grace, delicacy, and the expression of altitude were desired, and these were things which could not be perfectly attained until the pointed arch should come and bring the chance for dominant vertical lines. So *this* work may in one sense be considered primitive, archaic,—for it is tentative, not final. It is, in a word, anticipatory Gothic; but the earlier work is complete and perfect Norman.

Excepting only as regards the roof of the central alley. The aisles alone are vaulted; the broad middle space is covered with boards that now are slightly canted on either side, but once were flatly laid. Whether such a ceiling came by choice or by necessity, there can hardly be a modern eye to like it save for its historic interest. It still preserves its painted decoration from a very early though uncertain day,—small figure-designs enframed in lozenge-like patterns of black. When the walls were painted too, it wore, of course, a less painfully alien look than it does to-day, contrasted with the stony whiteness of everything below. But even then its woodenness must have been apparent, and must have seemed but a pauper finish to such gigantic strength of pier and arch and wall. And its flatness, giving too strong an emphasis to lateral dimensions, was out of harmony with all the rest. Only a huge and massive semicircular vault could have carried out the ideal the walls so perfectly express. Yet we cannot but believe that its own builders really found it satisfactory; for there is none of that preparation for a possible later vault which we almost invariably find when a great nave on the continent chances to be ceiled flat with wood. The great half-columns which rise between the arches are not vaulting-shafts, but run straight up to the ceiling without true capitals, and were evidently built to bear its rafters only.

The choir and transepts, as has been said, are earlier than the nave but essentially at one with it in their design. The transepts have a single aisle to the eastward and a painted wooden ceiling apparently even earlier than the nave's and still undisturbed in its first flatness.

The central alley of the choir was finished with a semicircular apse, but the aisles were stopped flat at the beginning of its curve. In Early-English days an independent chapel seems to have been thrown out at the end of each aisle; and in Perpendicular days the whole end was transformed, as our plan will show. Very boldly, yet beautifully, some nameless architect at the end of the fifteenth century met the need for more altar-accommodation at the east end of the church without destroying his Norman predecessor's work. Across the whole width of the church he built a single great undivided one-storied apartment, rising as high as the roof of the choir-aisles. The ends of these aisles were pulled down, giving free access and an open view from either side. But the central apse was left projecting into what, after a lapse of four centuries, is still called the "new building." It was partly remodeled in detail and overlaid with Perpendicular ornament; but the architect had too much confidence in the fundamental success of his scheme to care to obliterate all signs of his borrowings and piecings. A Norman string-course still remains amid the late details, and also many traces which the weather had made upon the wall while it was still an external wall, and even one or two of the iron fastenings which had held the shutters in the lower range of openings.

Seen from the interior of the choir, this lower range of openings is found to have had its arch-heads changed into pointed shapes and filled with a rich fringe of tracery, through which the eye passes to the elaborate "new building." But the two upper ranges rising above the roof of this still keep their round arches, though filled with tracery for the reception of glass. This remodeling is in the Decorated style, and was done some hundred years before the "new building" was itself constructed. And, indeed, there is no part of the church which does not show the trace of constant, persistent alterations of a similar kind. Art grew too vitally and vigorously in those ages for any generation to be quite content with what its forefathers had bequeathed. If nothing important remained to be built, there was always something which might be re-touched into harmony with current tastes. The development of glass was perhaps the most potent factor in

TWO BAYS OF THE NAVE.

the work of never-ceasing change; but the mere desire for what was thought a better beauty played, too, a considerable rôle.

The "new building" is an extremely beautiful example of Perpendicular art in its construction and in its details as well as in the boldness, yet good sense, of its arrangement; and its lovely, daring fan-vault shows in most interesting contrast with the work of those early builders who scarce ventured upon vaults at all. But we are not yet on the true birth-ground of the Perpendicular style, and once more may pass it briefly over.

The ceiling of the choir is a rich fifteenth-century vault; but, nevertheless, it is not built

of stone. And often again we shall find similar evidence of how the English love of wood persisted even in those days when vaults had most clearly proved their greater charm and fitness.

VI.

THE exterior of the east end is wonderfully picturesque, with its light, low, square Perpendicular building crowned with a rich parapet and statues, and its old Norman apse raising two ponderous round-arched tiers above. And as thence we pass along the north side through the beautifully planted church-yard, we find a succession of pictures which will hardly be surpassed elsewhere. The west front, too, rises in superb isolation above the broad green close before it; and, if we stand farther off, in the market-place of the town, above a beautiful gateway built by the Normans but largely changed by later hands.

But it is only such near views as these which are really fine at Peterborough. The town lies flat, and gives but a flat site to the church; and the church is itself so low, and crowned with so stunted a central tower and so insignificant a group of western turrets, that from a distance it makes no very effective picture.

Two years ago, when our illustrations were drawn, it had no central tower whatever. The great man who made the portico was not the only Peter-

borough architect who thought more, or knew more, of effectiveness than of stability in building. The Norman tower was raised on such inadequate supports that, at least as early as the year 1300, it cried aloud for reconstruction. So it was taken down, and the sub-structure strengthened. The great arches which opened from the nave and the choir into the crossing were rebuilt in pointed shapes; and though their mates on either side above the transepts were left intact, pointed "bearing arches" were built solid into the superincumbent walls. Then a low tower was placed above them, with a wooden lantern, which was removed in the last century.

But during many recent years it had been known that the tower was again insecure. Its pillars were bent and bulging, and the arches of transepts and choir were visibly strained. To prevent such a catastrophe as befell the tower of Chichester cathedral not long ago, the whole work was again pulled down, and more completely than before. When I saw it in 1885 the great angle-piers with their four arches were again in place, having been rebuilt from the very rock beneath the church; the old stones, carefully kept and numbered, having been replaced with as much fidelity as entire firmness could permit.

Doubtless a shrinkage of the soil, consequent upon the draining of the adjacent fens, has contributed somewhat to that dislocation of the fabric which, even in the very ends of choir and transepts, is apparent to the most careless eye. But a great deal, too, must be laid to the account of their builders' want of thought or lack of knowledge. It was singular to hear how superficial had been the foundations of so vast a work; and singular to see how poor the actual substance of its apparently Titanic piers. Portions of the casing of the choir-piers had been removed for needful patching; and could one call these great architects "good builders" when a pier eleven feet in diameter, and bearing such tremendous weight, was seen to have but a nine-inch-thick skin of cut and cemented stone and a loose core of what hardly deserved a better name than rubbish? One could well credit one of the architects in charge of the repairs when

he said that, but for the extraordinary toughness of the white Barnack stone, the whole fabric must long ago have twisted, torn, and wrenched itself asunder.

And not only poor, but overdaring methods of construction had contributed to the insecurity of the tower. At Norwich the great angle-piers are 10 feet in diameter and 45 feet in height, and the arches between them have a span of 23; but at Peterborough this span is 35 feet, while the piers are 52 feet high, and only 7 in diameter.

VII.

It would be hard to exaggerate the wealth or the renown of this monastery during all those ages when it was popularly called the "Golden Borough." The pope had decreed that any "islander" who might be prevented from visiting St. Peter's at Rome could gain the same indulgence by visiting St. Peter's here; and so great in consequence grew the sanctity of the spot that all pilgrims, even though of royal blood, put off their shoes beneath the western gateway of the close. Many precious relics, too, the monastery owned,—chief among them the famous "incorruptible" arm of St. Oswald, the Northumbrian king.

But the castigation of Reforming years was as signal as had been the reverence of Catholic generations. Henry left the church intact, divided up its revenues with the new cathedral chapter he established, and made its time-serving abbot the first bishop of the see. But the Cromwellites all but obliterated

THE CATHEDRAL FROM THE MARKET-PLACE.

THE CATHEDRAL IN 1885. (FROM THE SOUTH.)

the monastic buildings and all but ruined the church itself. Its splendid glass was entirely shattered, its great silver-mounted reredos was broken into fragments, and its monuments and carvings were mutilated or destroyed. The vast picture of Christ and the Apostles on the ceiling of the choir was used for target-practice, and the soldiers did their daily exercising in the nave. Even the actual fabric was attacked, and one arch of the portico pulled down.

Later this arch was rebuilt with the old stones, and the whole church was repaired. But repair meant partial ruin too. The church was patched and pieced with materials taken from the domestic structures; and even the beautiful Early-English lady-chapel which projected from the northern transept was destroyed to the same end.

Little remains within the church to give it an interest apart from its architectural interest proper. Yet one can still find two tombs that vividly bring back the past. Singularly enough they are the tombs of two famous women, both uncrowned queens—alike in their misfortunes, though most unlike in all besides. Mary Stuart was beheaded at Fotheringay, eleven miles west of Peterborough, and buried beneath the pavement of the south choir-aisle. As we stand over her empty grave she seems a more real figure than in the crowded mau-

soleum at Westminster whither her son removed her disparted bones. The other tomb, beneath the flagging of the north choir-aisle, still holds its tenant.—Catherine of Aragon. Thanks to the Puritan, nothing does her honor save the simplest name and date upon the stone—unless, indeed, we may credit the tale which says that Henry raised the church to cathedral dignity in answer to her death-bed prayer that she might be given a monument fitting for a queen.

The monastic buildings once covered a space four times as great as that which was covered by the church itself. But scanty enough are the fragments which report of them. A splendid Early-English gateway gives access to the bishop's palace on the right hand of the western close as we approach. The dwelling itself is largely modernized, yet it is picturesque and keeps some portions of the old abbots' home. Opposite, across the close, built into the modern grammar-school, is a charming apse—all that remains of the Norman chapel of St. Thomas of Canterbury. South of the church the cloisters are but fragmentary, many-dated ruins. The vast arches of the old infirmary stretch uselessly across a narrow path or are built, very usefully, into the walls of the canons' modern houses. And over a wide distance other fragments may be traced, with much interest when one is on the

PETERBOROUGH CATHEDRAL — NORTH SIDE IN 1885.

spot, though not with much significance in print. The ruin has been far completer than at Canterbury; and, though charming in its way, Peterborough's picture of united old and new is far less lovely than the mother-church's.

VIII.

THE town of Peterborough, offspring and creature of the monastery, has no independent civic history to tell. Nor has it any great interest for the eye, being but a commonplace little provincial center of some ten thousand inhabitants. On market-days, however, its streets are agreeably full of life and bustle;

and the market-place, opposite the close and the cathedral's western front, is prettily carpeted by a hundred white and blue umbrellas. To the eastward lies the fen-country, flat and treeless still, though reclaimed into fertility from its quondam estate of bog and mist and bisecting muddy stream. Near at hand its details are unlovely; but from the top of the cathedral, the vast level space has something of the sea's serene nobility. To the westward of the town lies a charming, rolling, wooded country, watered by a dainty river and set thick with great estates and tiny villages and very ancient rural churches.

The most interesting village is Castor,

RECONSTRUCTING THE TOWER. (FROM THE CHOIR.)

THE CATHEDRAL FROM THE BISHOP'S GARDEN.

which tells its Roman origin by its mere name as well as by the relics of its camp. It is not pretty and tree-grown like most of its neighbors; but on the top of its low, bleak, bare hill stands one of the finest small Norman churches in all England, cruciform in plan and still keeping its central tower. This seemed

to me more beautiful in design than the greater tower at Norwich; and it is of much historic value, if we are right in believing that it was built by the same hands which constructed Peterborough, and that it shows what may well have been the pattern of Peterborough's own tower in its earliest days.

M. G. van Rensselaer.

WHEN SHE COMES HOME.

WHEN she comes home again! A thousand ways
 I fashion, to myself, the tenderness
 Of my glad welcome: I shall tremble—yes;
 And touch her, as when first in the old days
 I touched her girlish hand, nor dared upraise
 Mine eyes, such was my faint heart's sweet distress.
 Then silence: And the perfume of her dress:
 The room will sway a little, and a haze
 Cloy eyesight—soulsight, even—for a space:
 And tears—yes; and the ache here in the throat,
 To know that I so ill deserve the place
 Her arms make for me; and the sobbing note
 I stay with kisses, ere the tearful face
 Again is hidden in the old embrace.

James Whitcomb Riley.

COLLEGE BOAT-RACING.

THE course at New London is four miles straight away; and except that there is a tide, which makes impossible any accurate comparison of the "times" made in different years, there is not a better course in the country, or probably in the world. The first rowing regatta that I ever witnessed was a single-scutt race, at Concord, Mass., about a quarter of a century ago. The distance was half a mile and return: and the start was from the old red bridge. It was a hot, bright day,—a Fourth of July, I think. The first to appear was Sam Hoar, in his skiff, *The Pickerel*. It was a flat-bottomed craft, about ten feet long, by two feet in greatest width: short outriggers, and straight ash oars. Sam was a slender, wiry boy of fifteen; as he came pulling up to the start, with a long, lithe stroke, he was greeted with applause from the crowd

assembled on the bridge,—the Grand Stand for the occasion,—which he acknowledged with a grin. He seemed quite at ease, both with his boat (which I believe he had built) and with himself: and everybody wished him well, though nobody expected him to win. There were three or four other contestants, but the only other that I can remember was Wilkie James. Wilkie was the favorite against the field; he was strong and robust, with superb chest and arms, and he had a new varnished keel boat, very light and graceful; he wore a crimson silk kerchief on his head, and, except for a perceptible nervousness, looked all over a winner. His stroke was different from Sam's,—it was short and vicious, and more rapid than the other, and I, for one, could entertain not the slightest doubt that it would easily bear him to victory. I was glad of this, for I was very fond of Wilkie; but I was also sorry, for I had a great regard for Sam, and added to that was the sympathy which one always feels for the smaller boy in a fight.

The next moment, the entire Grand Stand was delirious with excitement. Mr. Sanborn, in a stentorian voice, had given the word "Go!" and the boats were off. Grace Mitchell, her lovely face flushing with emotion, screamed aloud, and frantically waved both her parasol

HEADQUARTERS OF COLUMBIA FRESHMEN ON THE THAMES.

and her handkerchief at Sam, who had caught the water first, and was doing well; Maggie Plunkety, her glorious eyes fixed steadfastly upon Wilkie, uttered not a sound, but it seemed to me that her look, could Wilkie but have seen it, would have carried him to the front with the flight of a hawk. All the boys were shouting themselves hoarse. Meanwhile Wilkie, in his eagerness to settle the matter off-hand, had missed the water with his left oar, and his right had wrenched the boat out of her course. His efforts to straighten her jerked the left oar out of the rowlock; and before he could get it in place again, Sam was unmistakably ahead. Both of them were already some distance down the river; and the three or four other contestants, falling behind, obstructed our view of the leaders. Several of the spectators, including Willis, the champion runner of the school, had taken their places along the bank of the stream, and were running abreast with the boats, waving their arms and hats, and shouting madly, "Go it, Sam!" "Stick to him, Wilkie!" but which was in front, we of the Grand Stand could not tell. All was a wild, blind turmoil of enthusiasm, suspense, and outcry; in the midst of which I caught a glimpse of Sam pulling his long stroke with apparent ease, and of Wilkie digging his oars desperately into the water, and steering somewhat wildly. Of the other boats, two had fouled each other, and a third oarsman had caught a crab and upset himself, and was swimming ruefully ashore. The flag on the distant turning-stake hung downwards heavily in the still, sunny air. Who was that who was even now turning it? He wore a white kerchief, yes, it was Sam! and he was already stretching out for home when Wilkie came up and turned after him. Would the leader be overtaken? Most of us thought he would be: but Grace was clapping her hands and laughing wildly in triumph; and Maggie's cheeks were crimson, her delicate lips were pressed together, and her charming eyebrows were contracted in a frown of anxiety and disappointment. On came the competing boats; and now it was evident that the wearer of the crimson scarf was hopelessly behind. His great strength and his varnished boat and the fact that he was the most popular fellow in school, could not give Wilkie the race; for there was Sam, lithe and easy as ever, rowing in a dozen lengths ahead. When he passed the line, and backed round his boat so as to face the cheering crowd on the bridge, he was a boy to be envied, even leaving Grace out of the question entirely. Wilkie did not finish the course; he pulled aside, and landed on the bank in a state of great dejection, for he had shared the general anticipation as to the result. This race,

perhaps the most exciting to me of all that I have witnessed, proved that skill, and not superior strength, is the essential element in oarsmanship; and that the long, swinging body-stroke that Sam rowed was, easy as it looked, much more effective than the short, jerky arm-stroke adopted by Wilkie. Thinking over the matter by the light of the practical experience of later years, I have inclined to the suspicion that Sam, in addition to having some familiarity with the art of rowing, had been doing a little quiet "training" for the race. He certainly looked remarkably cool and comfortable at the finish, whereas Wilkie was deeply flushed. That was twenty-five years ago: it does not seem nearly so long. And yet Sam, maintaining his winning stroke through life, has reached the winning-post of the Bar, as formerly on the regatta. Wilkie, after having been wounded in the front of the gallant charge at Fort Wagner, has since gone to another world: while as for Grace and Maggie, I make no doubt that they have long been the objects of the adoration of loving husbands, as they were then of romantic school-boys, and have sons as tall and hardy as were the victor and the vanquished of that summer-day's boat-race. But, as I sit here and remember them all, I can almost fancy that we are all young again together.

Regatta-rowing is a modern luxury; it was unknown forty-five years ago, and less than a generation has passed since it attained any considerable vogue. It is the best substitute ever devised for the old Olympic and Isthmian games. Of late years, the mechanical appliances have been greatly and ingeniously improved, until one would almost think that the boats might row themselves. The crews, perhaps, have not improved quite in the same ratio; but the issues are still tried on their merits, and the boys make fast time. The simplicity, the primitive methods, and something of the Spartan zeal of the old times are gone; but other good things have taken their place. It may be said now, as before, the races are rowed by gentlemen, for gentlemen (and ladies); and we may be confident that—in spite of certain tendencies which will be noticed further on—this will always continue to be the case. It is a glorious sport, beneficial alike to the outer and to the inner man; and, notwithstanding the easy witticism which is every year lavished upon it, it is fully worth the time and importance given to it by its disciples.

At Harvard, in 1863, the newly entered Freshman Class heard much about the famous Caspar Crowninshield crew, which had defeated Yale at Lake Quinsigamond, making

under nineteen minutes for the three miles with a turn. And this was really good time, even compared with what is done nowadays. The "turn" occupied at least twenty seconds; there were only six oars in the boat; the oars were straight (instead of having spoon-shaped blades as at present), and the boats lacked much of the lightness and good modeling they have attained since. Moreover, there is no tide on Lake Quinsigamond, whereas the tide runs from two to three miles an hour on the Thames at New London. Finally, the art of rowing was then in its infancy in this country, and the science of training was not even born. At all events, Caspar Crowninshield and his men, if not giants in reality, were so in our eyes, and apparently their victory had discouraged Yale, for no race between the universities had taken place since that day.

In 1863, however, a challenge from Yale was received, based (as we afterwards found out to our cost) upon a very reasonable hope of winning. The challenge was accepted with enthusiasm, and with a confidence at least equal to that of the challengers; for the (then) Sophomore Class of '66 thought great things of itself, and really did contain an unusual number of muscular young men. There were Fred Crowninshield (brother of the heroic Caspar), Charley MacBurney, Ned Clarke, and (unless I am mistaken) Bob Peabody,—all from this same redoubtable '66. Then there was Horatio Curtis, the Hercules of the University. I suppose no man ever was or will be so strong as we thought Curtis was. We firmly believed that he could have thrashed Molineaux. Now Molineaux was the college professor of athletics of that date. He was a gentleman of color, and an ex-prize-fighter; at least, he had once fought in the prize-ring, and it was understood that he had been victorious; though I am not so clear as to that matter now as I was then. He was certainly a clever boxer, and a man of most agreeable and cheerful manners; his weight was about one hundred and ninety pounds, and his biceps, besides being as hard as a hickory log, measured eighteen inches in circumference. A blow from that arm might have made a hole in a steam boiler: but Molineaux was lazy, and he was fat; and one theory was, that Curtis would first "wind" him, by dint of superior activity, and then go in and finish him as opportunity might serve. It was a daring conception, and is mentioned here only in order to afford a measure of the popular reverence for Curtis.

The autumn term was spent in exercising in the gymnasium and in trying men for the crew. Besides Curtis, there were few or no rowing men in '65, and the Freshmen, though

containing some material that promised well for the future, was as yet immature; while as for the Senior Class, they had grown up during a period when athletics had fallen into disuse. So the choice was practically confined to Horatio Curtis and to the Class of '66. Blaikie was one of the best-known athletes of those days, but he had not yet received his diploma as a bachelor of oarsmanship; he could put up the ninety-six-pound dumb-bell—we used to go down to the gymnasium to see him do it—but he lacked the quickness and elasticity needed for the boat. He was a '66 man, and so was Tom Nelson, who, by natural constitution, was a rival of Curtis himself, if he were not even better than he; but he was as indolent as he was strong, and never could be induced to take regular exercise in the gymnasium or to row, if he could avoid it. Ned Fenno was strong enough, and was a zealous gymnast, but he was not handy with his oar; and Wilkinson, in addition to being one of the wittiest and most charming fellows in the college, was superbly developed, and as active as a cat; but he was not then thought to be superior to some others, though, a couple of years later, he proved himself equal to the best. The second-rate men were put together in the Class crew of '66; and the Freshmen formed a practice-crew of their own, making use of the old lapstreak which had conquered in 1860. I remember little of the constitution of this crew, except that Harry Parker pulled bow and Bill Ellis stroke, but I have not forgotten how we blistered our hands and barked our knuckles; or that we caught many crabs, and occasionally steered into the bridge, and carried off an outrigger or two. At that epoch, and for a good many years afterwards, it was the custom of American crews to dispense with coxswains, and for the bow-oar to steer by pressing his feet against a yoke attached to wires, which extended the length of the boat, and were made fast to the rudder. There was a Yankee ingenuity and economy in this device, and with practice, the steering was remarkably accurate; but after all, it is better that some person in the boat should keep a constant eye to the boat's course, and that that person should have nothing to do or to think of but steer. Of course, this is still more the case with an eight-oar than with a six-oar, and when (as generally happens) the coxswain weighs less than a hundred pounds, he is not worth considering.

Our boat-housing arrangements were primitive. The boat-house was a long shed, built on tiles over the water and destitute of a floor. A narrow platform ran around the walls inside, about half-way above the water, and the

boat was suspended at the same level by ropes running through pulleys attached to the roof. After we had assumed the proper boating-costume,—an old pair of trousers and a ragged undershirt,—we lowered the boat into the water, and then let ourselves down into her, hand under hand, by the rope. Our return was accomplished by an inversion of these proceedings. It was not always agreeable's scrambling up that rope, with blistered hands, after a long row; and occasionally a feeble brother would stick half-way, and have to be dragged up by the neck and shoulders.

A new boat—a "shell"—was bought for the University crew. This craft was the object of our respectful admiration. She was built of cedar, and polished, and was about fifty feet long, and she looked, with her shining spoon oars, as if she could win anything. She would have appeared very rude alongside of the ships they build nowadays, made of paper, with sliding seats, pivoted rowlocks, and stretchers to fit the soles of the feet. As regards the paper, we came to that ourselves in the course of two or three years; but the sliding seats were long after our time. They were first invented, I believe, by some ingenious single-scull oarsman, whose name I have forgotten. I should like to know precisely how much difference they make in the time of a boat. Not many seconds, probably. They lengthen the stroke, of course; but, on the other hand, they make it slower. The spurting stroke in those days used to go up as high as forty-eight to the minute, and be pulled through at that. At present, forty or forty-two is the maximum; and as the strength with which the oar is dragged through the water has not increased in the same ratio as the distance through which it is dragged, the gain must be limited. Perhaps it is greater in the case of the single-scull than of the eight-oar. But there can be no doubt that the comfort of the oarsman in his seat is much augmented. We used to suffer a great deal in that way, and nothing in the way of cushions or paddings was a relief.

Not much in the way of practice on the river was accomplished that first autumn: we set ourselves to building up our muscles in the gymnasium. This was a circular building with a conical glass roof at the eastern end of the Delta. The Delta (where the great football contest between the Sophomore and Freshman classes used to be held, and where base-ball was played) has vanished now in all but name, and, for aught I know, the old gymnasium has disappeared also. It was nothing to compare in point of luxury and completeness, with the elaborate structure which Mr. Augustus Hemenway has since erected; but some of us contrived to get pretty strong there. There

were rings, weights, bars, clubs and dumb-bells, and there was a bowling-alley in the rear. The dressing-rooms of the four classes were at different parts of the rotunda, those of the Freshman and the Sophomores being farthest removed from each other. Twice or thrice a week, in the evening, a lot of the Freshman would assemble to be instructed by Molineaux. We stood in a circle, and our burly instructor took his place in the midst, and drilled us in calisthenics. It did not amount to much, if the truth must be told, and it was continued only during the first month or two of each year. After that, the boys were allowed to do as they pleased. But Molineaux was always ready for a chat or a laugh, and he was very popular with us all. His great forte was taking the dimensions of our chests and arms, and writing them down in a book. This ceremony was performed at least once a week for every one in the gymnasium class, and we soon knew to a fraction the girth and biceps of all the athletes in college. What an arm Bill Poor had! but was not Farnham's about as large? If Jim Hoyt and John Greenough were to fight, which would come out ahead? If Tom Ward would only consent to row, what a bow-oar he would make! Will Ed. Perkins the Fresh-Sophomore go on the crew? He measures sixteen and a half, and they say he used to row at Exeter. Such were the speculations of our tender minds in that far-off time. I dare say similar conversations take place now. What a happy time it was! how pleasant to see our muscles grow, and to feel our powers increase, and to believe that, in time, we could become the equal of any gymnast that ever lived!

Rowing-weights were not invented until two years later. They were considered a grand discovery. I understand that a much more realistic contrivance has taken their place since, so that the chief difference between rowing with them and rowing in a boat is, that there is no chance in the former case of getting a ducking. Our arrangement consisted of a handle attached to a rope, which was passed over a pulley, and had a fifty-pound weight fastened at the other end. Then we sat down on a low stool, and tugged away. Perhaps we made up in diligence some part of what they lacked in mechanism. I remember that Richards, in his winter training for the crew, used to pull on his weight for two solid hours at a stretch; and his back and shoulders were a spectacle for the gods. After half an hour or so, a little puddle of sweat would begin to form on the floor between each man's knees. The parallel bars was another favorite exercise of the rowing-men. We used to go through the various dips one

after another, until our pectoral muscles came to resemble those of the statues in the Vatican at Rome; and the triceps, at the back of the arm, got so tough that we could "dip" fifty or sixty times in succession with ease. Altogether, by the time spring came round, we doubted whether any amount of boating would give us exertion enough to make us feel comfortable.

With the spring time the training began: the walking, the running, the rowing, and above all the dieting. Rare beef and mutton, potatoes, bread, spinach, and one pint of liquid a day. A canter of three or four miles before breakfast, a longer walk and run later in the day, and at least twelve miles of hard rowing. They say now that we overdid it; but I don't know. The diet, especially the sudden and almost total deprivation of liquids, may have been a mistake; it had a tendency to make the men feverish and irritable, and to impair their appetites. Young fellows, most of them under twenty, lose weight too rapidly under such circumstances. As regards the exercise, however, I greatly question whether we exceeded wise limits, or even reached them. With plenty of sleep, and plenty of food, a healthy man ought to be able to row hard six hours a day (two hours at a stretch thrice repeated), and be all the better for it. Something like that is the only sure recipe for winning crews. It will even counteract, so far as anything can, the evil effects of a bad stroke; because, in the first place, it will insure the men rowing "together," and secondly, because it will develop and toughen the requisite muscles. This latter point is too much neglected. Those large muscles below the shoulders should be as hard as oak. I remember examining Bill Simmons after the Harvard-Oxford four-oared race in 1869. He was well set-up all over, an admirably proportioned man, but these particular muscles were phenomenal. And yet he was not a man of strong vitality, and he had been ill during the greater part of his English training. But it is the tendency now, and to some extent it was so then, to put "form" before everything else. You are given endless lessons how to hold your hands, how to feather your oar, how to get forward and back in exactly the same style; and meanwhile the essential matter, that the boat should be made to go fast, and to keep going fast, for four miles, is lost sight of. But if you put six or eight solid and sensible men into a boat, and let them clearly understand that their object must be to throw the weight of their bodies as much as possible into that portion of the stroke where they have the best purchase upon the oar; and if you explain to them that they must not dip their oars into

the water one instant later than it can begin to do good, nor keep it in one instant after it has ceased to do good; and that the oars must remain in the air as short a time as possible; if you can get them thoroughly possessed of these three or four fundamental principles, and keep them up to it, then you need not bother to teach them anything else. They will learn the refinements themselves. Or if they don't it is no great matter. It is impossible for eight men to both pull and look exactly alike. Each man will have (within certain limits) his own peculiar way of getting the most work out of himself. If you force him to adopt any one else's way, that of the stroke-oar for instance, the appearance of the crew as a whole may be more harmonious, but the pace of the boat will suffer. One or two or three men perhaps will be doing their best; but the rest will be shirking in one way or another. This fellow with the long arms will not get forward far enough; he with the short arms will overreach himself; and so on. Let the crew take long and repeated pulls together, however, and sooner or later they will instinctively and inevitably so accommodate their various styles to one another as to produce the best general result, and they will acquire the endurance without which no style is of much avail.

This truth was impressed upon me many years ago, when I saw for the first time the famous Ward crew of professionals. This was undoubtedly the best six-oared crew that ever sat in a boat. They came down to Boston to take part in the Fourth of July regatta on the Charles River or Back Bay course; and our own University crew of that year were their only noticeable competitors. We extended the courtesies of our new boat-house to them, and they staid with us about a week. Our early impressions of them were not especially favorable. They were rather a rough-looking set; they were shabbily clad; they did their pulling in dirty old red and blue flannel shirts; they did not seem to take much stock in bathing, or even in rubbing down. The boat they brought with them was not a particularly wonderful affair. As they did not strip, we had no opportunity to critically examine their development; they appeared to be a lean and wiry lot; but their average weight was hardly equal to that of our University crew, though their average age was a good deal more. But what chiefly struck us was the circumstance that they did not seem to know how to row. Their appearance when in motion was ragged and inharmonious. "They're not together," was our general verdict; and our own crew was so beautifully together that we had little doubt as to the issue of the race. "They can't win

with that stroke," we said. Not but what, individually, they pulled well enough and hard enough; the trouble was that each man maintained his individuality. There was vigor, but not science. Instead of fearing them, we were rather amused at them, and a little sorry for them; for were they not poor men, to whom the loss of a race meant, not loss of glory merely, but of the means of livelihood as well? Possibly some of us may have gone so far as to think that our fellows would act gracefully in letting them get ahead just at the finish, after having shown to every one's satisfaction that they could beat them if they chose.

As it turned out, however, there was no necessity for putting these compassionate designs into execution. Perhaps the Ward brothers rowed in bad form; but it was abundantly clear, before the race was half over, that they could have pulled four miles while we were pulling three. And the worst of it was that they could not be induced to exert themselves; but, after an initial spurt, during which they appeared more like tigers than men, they paddled along at their ease, and passed the goal leaders by a few lengths only, instead of by two or three minutes; and it was evident, at the close, that they had not had half exercise enough to give them an appetite for supper; while our men had been tugging their hearts out all along. Nor must it be forgotten that the University crew of that year was one of the best, if not the best, that Harvard ever sent forth; and that it beat the Yales without difficulty at Lake Quinsigamond the same summer. What was the secret of the Ward brothers' victory? In the first place, they were stronger and tougher than our men,—a strength which they attained by constant hard work in the boat; and secondly, they neglected the æsthetic and graceful side of the matter, and devoted themselves exclusively to rowing each one with all his might. Of course their oars all entered and left the water simultaneously; of course they all applied the "lift" at the same moment; but apart from this, the bow-oar's style of getting his work in appeared quite different from that of the stroke oar; and number three was unlike both. Good rowing is like good acting; it can be attained only by constant rehearsals. Practice, practice, practice, together and continually; and then you will row like one man and yet retain your separate individualities at the same time.

This terrible experience with the Ward brothers was subsequent to a still more humiliating one with Wilbur Bacon's famous Yale crew. Rumors of this crew came to us betimes; marvelous tales of their strength, their methods of training, and the appalling rapidity of their

stroke. One of their men was reported as having complained that water was too easy for him to row on; he wanted some more solid and resisting medium to pull his oar through. As for training, they ran five miles straight up hill before breakfast every morning, ate raw meat exclusively, and drank nothing at all; and they rowed sixty strokes to a minute. Doubtless these were exaggerations; but after all deductions were made, Wilbur Bacon's crew had enough left not only to beat us easily, but to make remarkably good time over the course, far better than that of any other college crew, up to that date. And they did this with one of the ugliest and most wasteful strokes I have ever seen. So bad was it, indeed, that the reporter we sent up to New Haven to spy out the enemy, came back jubilant, and declared that there would be no race at all; such a stroke as Yale's was hardly worth while rowing against. And, as a matter of fact, that year's victory and the victory of the next year (with the same crew) probably did Yale more harm than the most overwhelming defeat would have done; because their stroke was really bad in principle, and being nevertheless subsequently adopted by Yale as the correct one, led to six consecutive defeats more or less severe. The men sat huddled up, with bowed backs, and pulled entirely with their arms. Wilbur Bacon's men, being of entirely exceptional strength and thoroughly trained, won in spite of this drawback; but if they had added the strength of their bodies to that of their arms, there is no telling what they might have done.

There was great talk in those days — and I believe there has been ever since — about the transcendent merits of the "Harvard Stroke." Where did the Harvard stroke come from, and what is it? Was it the stroke rowed by Caspar Crowninshield in the 'fifties? Was it the stroke of the English university? Was there any secret about it, unfathomable by any but Harvard men? Taking the record of all the university races rowed since 1852, I make out that Harvard has won 15 times, and Yale, or some other university, 13 times. This is very far from establishing the superiority of the Harvard stroke over all others. I greatly doubt whether the Harvard stroke has any distinct and real existence, and I think that the sooner that idea is adopted, the better for Harvard, and for the art of rowing in general, will it be. Back and arms straight — catch at the beginning — such are the traditions. But, beyond certain limits, no hard and fast rules can be given. Each man must be allowed to find out for himself how he can best put his whole strength into his stroke; and then the constant practice of the crew together must teach each member of it how to maintain his own best

form, and yet so accommodate it to the others, that each may help all, and all each. Let the aim be, not to row the Harvard stroke, or the Yale stroke, or the Oxford or Cambridge stroke, but to make fast time, and then, before long, we shall begin to have races that are races and not processions; and the winning crew will win because it contains the strongest and best trained men, not because its stroke has this or that or the other title. A little more common sense, a little less theorizing, a great deal less self-conceit, those are some of the things essential to good rowing in our colleges. The better time two crews make, the more nearly alike will their style be found to be, as may be seen every year in the Oxford-Cambridge race; and the moral of that fact is so patent that there is no need of further expatiation upon the matter. Between 1873 and 1881, I saw most of the English university races; and the difference between the crews, so far as stroke and style went, was too insignificant to be taken into account. The difference between them as regards time was never more than a few seconds, and once they pulled a dead heat. As a rule the heavier crew won. The course there is a little over four miles, and the currents and eddies and the windings of the river are against good results; nevertheless, the times made during the last ten years are better than the best at New London, where the conditions are the most favorable that can be conceived. The men themselves, on the other hand, appear for the most part inferior to our own in strength and muscular development. Stronger men than Wilbur Bacon, or Will Simmons, or even Penrose, are seldom or never seen in English university crews.

New London in June and July is a lovely town; and during the Regatta week it is full of jolly bustle and brilliance. The body of the town lies a mile or two within the mouth of the river, on the western bank; though there is a straggling line of villas along the road to the Pequot House which commands a view of the Sound and of the Long Island shore. On the eastern bank, stands Groton monument, a granite pillar that reminds Bostonians of their own Bunker Hill. In the broad harbor are anchored scores of yachts, as neat as a lady's dressing-case; others are tacking up and down, and tugs, steamboats, and numberless smaller crafts hasten to and fro. The huge clumsy ferry-boat that conveys the Shore Line railroad trains from one bank to another ever and anon makes its lumbering trips across the river; and sharp-nosed, dapper steam-yachts, with backward-sloping masts and funnels, slide up and down with heavy rollers diverging in their wake. Beyond the Shore Line railway,

the river pursues a nearly straight course northward, with an average breadth of rather less than half a mile. The finish of the race (when rowed down stream) is at Winthrop's Point, a promontory jutting out into the river just east and north of the city; the start is at Bartlett Point, four miles up. The course is marked by flags, whose positions at the mile points are determined by measurements taken on the ice during the winter: standing with a spy-glass, at either end of the course, you can see them all accurately aligned. Along the western margin of the stream runs the New London and Northern railroad, which seems to have been constructed for the especial purpose of affording a moving view of the race from start to finish. The only untoward place is at the two-mile flag, where the rocky promontory of Mamacoke lifts itself stupidly between the regatta train and the crews. As this is the point where the closest races are won and lost, we have an additional instance of the fact that nothing in this world is perfect.

As the time for the race draws near, New London puts on its gaudiest attire, and rouses into a bustling and uproarious life, which must seem strange to its older inhabitants. For it is one of the oldest New England towns, and had already preserved the placid tenor of its existence for several years before it became a prominent depot of the whaling interest, sixty or more years ago. Then was its ample harbor crowded—not with gay and graceful craft of the New York Yacht Club, as at present, but with dingy and oily whalers, dropping in with the tide from a four years' cruise around the Horn, and into the North Pacific, and with their holds overflowing with oil enough to fill all the lamps of the New World. They were passed by others, setting out on their long cruise, some never to return, but destined to leave their oaken ribs, and the bones of their crews, miles deep beneath the surface of the distant sea, lower even than the great leviathan himself durst venture. Then the streets were noisy with the bustle, not of pleasure but of business; and the sunburnt faces of the passers-by belonged not to athletic college youths, trained in slender racing-shells, but to hardy mariners, familiar with the whale-boat and the harpoon, who had confronted death and deadly peril a thousand times. And the female element of those days was represented, not by lovely girls, laughing in silk and muslin, and fluttering in the crimson and blue ribbons of the colleges of their choice; but by lean and sober matrons, accustomed to long months and years of loneliness; and some in black garments, whose loneliness would never know relief. Little thought they of railways or regattas; life for

them was anxious and severe : and it was joy enough if, at the end, when old age came, they could see their weather-beaten husbands beside them, and their children round about, and know that there was money enough in the strong-box to eke out the remainder of their days.

People are still alive in the old town who have seen those times : but they must often feel as if they were walking in a dream. Here are the same streets, the same harbor, the same hilly shores, many of the same houses ; yet all is changed ; hardly can they recognize the home of their youth. Where did these ferry boats and huge beam-engine steamers come from ? Who built those new piers and wharves ? What means this rumble and shriek of trains ? And during what night did these fine hotels sprout up like mushrooms, their gables waving with flags, and their lobbies thronged with clamorous guests ? The noisy thoroughfare of the town is broad and brilliant ; the shops which line it on either side are rainbow-hued with every sort of badge and decoration that the enthusiasm of college youth can be supposed to covet. Here are crimson and blue hats, jerseys, and sack-coats ; dresses for Harvard girls and dresses for Yale girls ; sashes, ribbons, bonnets, banners, and rosettes ; Harvard cigars and Yale cigars ; nothing, in short, that is not either Yale, or Harvard, or Columbia. And the sidewalks are crowded with old graduates and young graduates, with freshmen, sophomores, juniors, and seniors, and even with boys who are still looking forward with hope and fear to their entrance examinations. If there be any one there who is not either a past, present, or prospective college man, he must wish he were, or be inclined to pretend that he is. It is a singular spectacle,—enlivening, comical, pathetic ; a sort of Vanity Fair of youth and fun, with the dim past on one side and the mysterious future on the other. Some of these young fellows will make longer voyages than to the antipodes, and bring home larger game than whales. Some of these pretty girls will experience sadder tragedies than the drowning of a husband, a father, or a son. But now it is all " Hurrah for Harvard ! Hurrah for Yale ! and the deuce take the hindmost ! "

Farther up the street stand handsome villas and country residences, with stretches of green lawn in front of them, and flag-staffs on their cupolas, with flags afloat. From within comes the sound of music, singing, and laughter, and perhaps, if one listen closely, of the popping of champagne corks and the click of billiard balls. The porches and verandas are brightened by the fresh dresses of girls and the summer suits of fashionable young gentlemen ;

and here, there, and everywhere, the one topic of conversation is the race. But if you venture into the side streets, you will find comparative solitude and silence. The few people whom you meet seem scarcely alive to the importance of what is going on elsewhere. It reminds the traveled spectator of the Carnival time at Rome, when only the Corso goes mad, and all other thoroughfares are silent and sober even beyond their usual wont. Many pretty walks lie outside the town ; but the prettiest, perhaps, is along the southern bank of the river, toward Mamacoke ; and the visitor to New London, with leisure on his hands, can hardly do better than to make a journey thither.

Starting from the railway-station you pass out by way of Main street. Though everything is neat and well-preserved, many of the houses are evidently old ; their broad hip-roofs and thick bulging eaves do not belong to the architecture of this century. Alternating with these are brand-new villas of the modern Queen Anne type, and other houses which can only be described as American, and are destitute of any describable features whatever. For the first half-mile of the way, the road passes along the side of a creek, above the sloping bank of which the rears of the houses are uplifted on stout piles, as if they had pulled their skirts up out of the mud, and revealed an array of dirty legs,—of which, however, their decorous fronts betray no suspicion. The creek itself is picturesque with old rotten boats, lying stranded and half-submerged ; an occasional tug lounges in to rest and smoke its pipe after its day's work ; and even a dainty steam-yacht will condescend to pick its way between the groups of plebeian shipping, like a fine lady poking her aristocratic nose into a tenement court. Beyond the head of the creek, and so overshadowed with the heavy foliage of trees as to be scarcely visible from the road, appears a substantial elderly mansion. It stands on a slight eminence above the road, and thick grass grows tall and untrimmed all around it. It ought to be haunted, and probably it is ; but fearing a rebuff, the present writer abstained from seeking information on the matter. The answers to such questions are as well left to the imagination. Farther along, the road passes into open country, beautifully diversified with hills, wooded regions, and cultivated fields. A gradual ascent reveals a wide prospect, including the town behind, the river, and the high banks of the opposite shore. Nearly parallel with the road, but much nearer the water, lies the railway ; and beyond it, jutting out into the stream, is Mamacoke. Striking over the fields and crossing the track, we come in front of the rocks, clothed with trees and

bushes, and scampered over by flocks of sheep. It is almost an island, being joined to the main land only by a narrow strip of low-lying ground. From its summit one can see up and down the whole length of the course; and a mile or so higher up stream, on the opposite bank, is the crimson-roofed cottage used as the Harvard quarters; and further still is the cluster of whitewashed buildings occupied by Yale. If it be late in the afternoon, you may see one or both of the crews out for practice, accompanied each by an active little steam-launch containing the "coach" and four or five immortals who have won glory in previous boat-ing contests. In attendance, likewise, though at a more respectful distance, is the steamer *Manhanset*, which, with stalwart Captain Jim Smith at the helm, occupies its leisure time in affording interested persons opportunity to study the styles of the contestants. The crews, however, are none too anxious to be seen; they are as shy as a new boy in his first day at school. And if they are reluctant to reveal themselves prematurely to the general public, it is impossible to overstate the anxiety with which each shuns any risk of being spied upon by the other. They will even forego a pull rather than be seen pulling by a rival eye.

What is the reason of this excessive coyness? Suppose Harvard did see Yale taking a practice pull, or vice versa, what harm would it do? Would it paralyze the powers of the observed persons? Would it, when the day of the race came, prevent the better men from winning? Why are the "times" made in practice so carefully concealed, as if they were murder secrets? Nay, why does each crew cause it to be believed that its time is ten or twenty seconds slower than it really is? Why do they intimate that one or other of their men is suffering from severe indisposition? Why do they give it out that they are dissatisfied with their boat? Why are these and a score of similar misleading statements circulated, until, by the time the two crews are side by side at the starting-point, waiting for the word, a credulous person might suppose that both were certain to break down before they could reach the first mile flag? What, in short, and to use plain language, is the object and are the benefits of all this lying and jockeying?

Surely it cannot be possible that these young gentlemen, representatives of the best blood and culture of their country, not to mention athleticism,—surely we are not to believe that they can allow themselves to be influenced by pecuniary, by mercenary, considerations? Surely they do not put forth their strength and pledge the honor of their universities, for money? Professional oarsmen, as we know,

row for money: to win a race means, for them, to put so many thousand dollars into the pockets of themselves and of their friends. We find no fault with them for that (though we are sorry that so noble a sport should be prostituted to such uses) because it is their livelihood. We may even shrug our shoulders if it turns out to have been settled beforehand that the better crew should not win. But that our own sons, the inheritors of our names, should approach even within measurable distance of such transactions would be very unwelcome news indeed.

What are the facts? The facts are that the betting on these races, among the undergraduates themselves, and leaving outside persons out of the account, has grown to such proportions, and is increasing year by year at such a rate, that every man in the crews has a responsibility imposed upon him which he has no right to accept, and which tends to distort his views as to what the race is really being rowed for. Theoretically, he rows for the glory of Harvard or of Yale; but practically, he rows because his friends (and possibly he himself, likewise, though I trust the rule still prevails that forbids any member of a crew to lay a wager of any sort) have put up all their spare cash, and a good deal of cash that is not to spare, on the result. It is for the sake of this money that they misrepresent the truth, prevaricate, invent fables, and resort to all manner of underhand and shrewd devices. If they win, no doubt it is their university and not the dollar bills that are nominally cheered; but if they lose, they have to bemoan not only the dimmed luster of Harvard or of Yale, but the empty pocket-books of those who pinned their faith to them. And money means so much to college boys on an allowance, and with their vacation in front of them, that although they may be very sorry in the abstract for Yale or for Harvard, their most pressing and palpable grief is not unconnected with a much more sordid and less honorable cause. Harvard or Yale may win next year; but what is poor Jones or Smith to do, who has lost all his quarter's allowance, and has not settled his hotel bill? And let it not be forgotten, furthermore, that either Harvard or Yale is bound to win every year (unless Columbia does), and that the losers will then have prevaricated and fabled to no purpose. And finally, very little is really gained by all this elaborate deception. The boy who cries wolf so often is at length not believed on any terms; and we have learned to discount these stories about the condition of the crews just as we discount them in the case of professionals. A gentleman who cheats another out of his money, or attempts to do so, by leading that

other to believe what is not true, continues to bear his title only by courtesy; and he will have to give unmistakable evidences of amendment before gentlemen will again receive him on equal terms. I am far indeed from saying or thinking that any university race ever has been or will be rowed otherwise than on its merits; but anything that savors however remotely of professionalism cannot be given too wide a berth. Honest men will never suspect dishonor in these young fellows; but there are rascals enough who will agree that a man who has staked all he possesses upon an event will employ any available means to protect himself against loss; and it is the duty of honorable men to avoid the appearance of evil.

rowed. And even if the prophets prove correct, defeat will be no worse, nor victory any less sweet, if it has been expected beforehand. It is a rare privilege, too,—the opportunity to do one's utmost for no other reward than the parsley crown. It is a privilege which comes seldom in after life, as these young gentlemen will discover in due time.

There is another word to say about professional trainers. They are very honest and worthy persons, no doubt, but they have no business with a university crew; and the result last year, when Yale won under the administration of Mr. Robert Cook, shows that they are by no means indispensable. But even if they were indispensable, they ought not to be employed. We are not going to become

HARVARD HEADQUARTERS.

But can betting on the university races be stopped? That is not to be expected; but it can be enormously diminished, and that by no one else than by the crews themselves. If they will dispense with all disguises and subterfuges, and let themselves be known for just what they are, neither more nor less, then betting will lose nine-tenths of its impetus. Nor will the pleasurable elements of legitimate uncertainty as to the result ever be absent; for, however apparent it may seem that one of the crews is superior to the other, there are a dozen possibilities that this anticipation may be defeated when the race actually comes to be rowed. One man may overtrain; another may catch a crab; the stroke may turn out more effective than it looked; or the crew that had never done itself justice in practice may awaken under the spur of actual competition, and surprise its friends and strike aghast its enemies. No race is ever won until it has been

professional oarsmen ourselves, and we do not need to learn what they can teach us. Moreover, they can teach us very little. The chief advantage that a professional oarsman possesses over an amateur is, that he does nothing but row, and therefore (other things being equal) he becomes more skillful and enduring. But this endurance and skillfulness cannot be taught; it must be acquired in the same way that the professional acquired it, by doing and thinking of nothing else. He can no more impart it than he can impart the color of his hair, or the tone of his voice. And as it is always true that it is not necessary for a good critic to be a good artist in that which he criticises, it follows that though an amateur coach may not be able to row as well as a professional, he may nevertheless be able to give just assound instruction, and indeed much better. For the amateur will probably be more intelligent and cultivated than the professional,

THE RACE, FROM

and cultivation and intelligence are exemplified in nothing more than in the power they give to conceive an ideal and to explain it. But this is not all. Association with professionals, even with the best of them, tends to lower the social and moral tone. He is in the position of a guide, philosopher, and friend, and the young men who submit themselves to his tutelage will be liable to adopt his views on other matters besides mere oarsmanship and diet. They are at an age when susceptibility to impressions is at its maximum, and experience is at its minimum, and they will easily take color from an older companion; they will not so easily rid themselves of it afterwards. It needs no seer to tell us where a great deal of the shyness and smartness which has of late characterized the policy of the crews before a race comes from. There is a decidedly professional flavor about it. Again, as regards diet, professional advice is not to be trusted. Their knowledge of physiology and hygiene is purely empirical, and

is derived, moreover, mainly from experiments on themselves. But no two men can with advantage train exactly alike; especially no men under twenty, who are much more readily depressed and stimulated than are older persons. An amateur will have broader and more liberal views in this direction, and is also likely to be better informed as to the latest conclusions of science upon the points in question.

But the main thing, after all, is the abstract, not the utilitarian, aspect of the matter. It is not good, it is not respectable, to stoop to conquer. Use with all your might the means and weapons proper to your station; but do not, even with the certainty of gaining an advantage, condescend to receive help from any lower level. If you cannot row the race in twenty minutes without professional assistance, then be content to row it in twenty-six or even in thirty. All that is necessary is that you should do your very best. I was as patriotic, in my time, as any other Harvard man of my acquaintance, and I do not know that I have

THE OBSERVATION TRAIN.

lost any of my old interest in the welfare and reputation of my university; and yet, so long as Harvard employs a professional coach, I shall never regret to see her lose the race. Indeed, if professional guides and methods continue to be used, the college races will soon lose all their interest for that portion of the public whose good opinion is worth having.

During all this disagreeable fault-finding, we have been sitting on the summit of Mam-a-oke; and now there is barely time left to see the race. How shall we see it? We may either remain here, or hereabouts, or we may get aboard the *Manhasset*; or we may go to the Grand Stand, or on the Observation Train. If we are wise, we will adopt the latter course. The view from the bank or from the Grand Stand is partial only, and the more exciting the part that we see, the greater is our desire to see that part which is invisible to us. The *Manhasset* suffers under the serious drawback of being forbidden to approach within

two hundred yards of the last boat in the race; and it is impossible, from that distance, to know which crew is leading, unless the lead be a very commanding one. But the train shows us the relative position of the boats at nearly every half-mile of the course: we can see what each man is doing at each moment, and enjoy a conspicuous view of the river and everything on it. The cars are platform cars, and tiers of seats are built up on them, rising one above another, so that every one has an unobstructed outlook: only, if we can get a place on the central car, we shall be more likely than in any other to remain just opposite the boats during the race.

The depot is overflowing with a hurrying, excited, laughing, shouting, brilliant crowd. The boys and girls are decked out in blue and crimson finery; they carry flags of silk or cotton, as the case may be; and the peddlers of screeching tin horns drive a roaring trade. As the cars fill up, row after row, the clamor of talk and outcry increases, and becomes a

ceaseless refrain; and belated persons run anxiously to and fro, and make hurried and vehement appeals to the ticket collectors to be allowed to get where they do not belong. As we sit on the front row of the central car, two young undergraduates, standing on the platform in front of us, converse eagerly over our heads with three young ladies on the row behind us: we hear all they say, but, though they evidently enjoy saying it, it amounts to just nothing at all. They wager their fellows will win; they are afraid the other fellows may win; the Yale coxswain is going to steer without his shoes; the Harvard stroke has parted his hair in the middle; if the wind doesn't change, the course will be as smooth as glass; if the tide is high enough, the eel-grass won't matter; the race is certain not to begin on time—it never does; they hope our car will stop just opposite the finish; they wonder whether the winning crew will break the record. In the midst of this conversation, the first whistle blows, and there is a general stampede of the people remaining on the platform. The trumpet merchant blows a horrid blast on his last tin horn, and a moment after sells it at a sacrifice to the last enthusiast who is unprovided with one; the car moves, and a group of people in the next car give the first cheer. As the train moves out of the depot, we catch a glimpse of the long array of gay dresses and waving flags; and beyond, through a gap between two sheds, we see a brief panorama of the river, with a thousand vessels decked with streamers and crowded with spectators; and other crowds are massed along the banks, and every upright object carries a banner,—except only Groton monument, which stands tall and gray and undecorated above the scene, and takes no part in the excitement and suspense. As we slowly pass the long dingy façade of the factory, clusters of workmen gather in the windows and doorways, and stare stolidly at our rainbow array. Still onward we go, until at length we leave the railway buildings and the ugly coal-dump behind us, and the broad sweep of the river breaks upon our view. There is the Grand Stand, a mass of shifting color: there is the course, defined by the throng of yachts and small boats and big steamers crowding up to its straight limits, and dispersing thence to either shore. The start is to be from this end, so here we pause. Where are the crews? They have not got into their boats yet. Yes, there comes the Harvard launch, with the men on board, and their boat towing behind. Now the launch stops, and the boat is brought alongside. We can see the crimson jerseys, as one by one their wearers step cautiously into their places,

and drop their oars into the rowlocks. There, the last man is in; and off they glide to the starting-point. And Yale, where is she? Oh, they are embarking from the raft; and they too pull up to the flag, dark blue every man. Two dories are moored on a line with the post; in each sits a man whose duty it is to hold the stem of the racer in position, waiting the word. They are in position, all is ready! No: wait a moment. Off come the blue and crimson jerseys, over the wearers' heads, and are tossed to their launches; and the bronzed backs and arms of all those stout young fellows are exposed for the last time to the sun. How the muscles swell and shift beneath the smooth skin, as the men handle their oars, and reach forward! How active and tireless they look! And how their hearts are beating, and their teeth set! Now, silence, and listen for the word. No, we could not hear it; and if we could, the boats would be off before it reached our ears. So there is nothing to do but to watch—ha! they are off!

Off, amidst a roar of voices, a deafening screech of steam whistles and tin horns, a thunder of guns, pistols, and cannon; off, amidst waving flags and fluttering handkerchiefs, and cheers, and laughter, and screams of hysteric girls, and cat-calls of frantic undergraduates. They are off; but they hear nothing and see nothing of the wild confusion and uproar that welters around them. Each man's eyes are in the boat; each man strives to combine iron self-control with frantic exertion. Keep

VICTORY.

time! pull! lift her! we are gaining! we are losing! Steady, boys! there are four miles in front of you; space enough to win and lose. The little coxswain keeps his eye on the approaching flag, and the tiller-ropes are taut. Together, row! pull! pull! And behind them stream along the surging steamers, crowded with men like flies; and our train, too, moves forward, keeping pace with them as they go. One of them has forged ahead,—which is it? Never mind, the others have quickened their stroke,—they draw up again. There are three miles yet, well rowed! a gallant race!

There is an old lady on the bench beside us, and the tears are streaming down her face, and then she laughs and waves her hand. She is the mother of one of those struggling young fellows; he is the darling of her heart, and there is no telling yet whether he will win or lose. And above, there is an elderly gentleman with a detective camera; he too has a

boy in one of the crews, and he has come with the intention of photographing him in the moment of victory. But he has forgotten all about that, and is waving his camera madly in the air, under the impression, probably, that it is a flag; and he is yelling himself hoarse. Well, both crews cannot win; one must suffer defeat. And see! one of them has a long lead now, and it is increasing with every stroke. They are holding themselves well in hand. The others are doing their utmost, but they cannot close up the gap. Two miles! Three miles! What a race! The end is near; they all gather themselves up for the final effort. Break the record! ye winners! Defeat, but not disgrace, ye losers! And so, with glistening bodies, and heaving lungs, and straining muscles, and bending oars, they fly past the judge's boat, first one, then the other; and another year's regatta is lost and won.

Julian Hawthorne.

BOAT-RACING BY AMATEURS.

HE evils of introducing the professional element into amateur athletics are so great—they are so obvious to those who have dipped into matters of the kind without losing their faculty of criticism in the enthusi-

asm natural to the pursuit—that the first, the healthful instinct is to cry, Away with it all; give young men their heads; let them go to work without professional guidance and solve the problem as they best can by themselves! This is, however, the dictum of persons like ourselves who are no longer in the actual fight and can afford to assume an impartial and most wise attitude toward the contest, swayed as we are by considerations entirely different from those which met us when, boys in red and blue, we were of the battle.

Could we, however, become young again by virtue of some witch-potion and enter college once more with all the ignorance, liveliness, and ambition to succeed at whatever cost which we find to our surprise in the undergraduates of the present day, would we act so very differently after all? Would we not be charmed as of old by big, useless muscles in the men of our college class who practice daily at the dumbbells, and prefer unwieldy giants to smaller men with muscles less startling but far greater will-power to punish themselves in a contest? And when it came to preparations for a boat-race against a college with which rivalry, if

not exactly deadly, was a tradition of long standing, would it be in us to refrain from securing what advice was possible from professionals who make oarsmanship their means of livelihood? Probably not. Certainly while rowing had a precarious existence at American colleges, and there was no large body of graduate oarsmen on whom to lean for advice and from whom to beg the arduous and ungrateful services of a "coach," it was only human that professionals should be paid to look after the stroke and diet of the crews. Professionals were at least kept out of the boat. There is no record like that of the Brasenose Oxford four in 1824, which contained two college men, a professional, and an outsider of attainments unrecorded by the muse of history.

To the impetuosity of youth rather than the professional element we may ascribe whatever there is bad in the betting that goes on at college races in the United States. "Boys will be boys" is a remark which enjoys a perennial popularity in all ages and all lands. The same may be said of the spies that are sent out by two colleges to note the proficiency and faults of the rival crew: it springs from boyishness more than anything else; it is the act of half-men who a few years earlier were reading dime novels, daubing their cheeks with red clay, and lassoing their elders and betters in the semblance of buffalo, or shooting each other with arrows, in the semblance of red men. The precautions taken by each crew, not to allow the other side to see them at their best, may

be confidently set down to man's inborn love of outdoing his fellow by sly means as well as by the exercise of power. Every collegian is a Joey Bagstock, who hugs himself if he feels that he is "devilish sly."

Over here Yale College appears to have led off in 1833 with local races, and about New Haven there are legends of doughty crews who "astonished the natives" at fairs and Fourth of July festivities in rural communities of Connecticut, New York, and Massachusetts before the year 1843, when Yale formed a regular boat-club. Harvard followed next year, and in August of 1852 the two colleges met in New Hampshire on the lonely waters of Winnipiseogee. As these universities increased in size and other colleges began to take a hand in boat-racing, the professional element could not be kept out, for this reason: four years is a short period in which to form good athletes, and few men could afford to give themselves up to any kind of athletics each year of the college course. Hence it was not possible, even if it were in all respects the better method, to put four or six men in a boat and let them row and row until they settled down to a "telling" stroke without "good form," but effective in getting the boat through the water. The "Hillsdales" or "Sho-Wae-Cae-Mettes," or some crew of amateurs from fresh water or the backwoods, could and did employ this very natural fashion of perfecting themselves, and sometimes with astonishing success, particularly when they had to compete with college crews—trained, it is true, but not always wisely trained, and in any case compelled by their studious life to sacrifice many hours which otherwise could have been employed in practice. It has been found, however, that crews of this description cannot compete with college men who are well trained, if the latter can have a tithe of the practice in the boat secured to the former by long residence in one locality near good rowing-grounds. Science, intelligence, and especially "good form" do tell in all save peculiar circumstances when rowing men are considered, just as they do when soldiers are under consideration. It is a question of drill. The species of rowing crews of which the famous Ward four is the most conspicuous example of success depend for their triumphs on a life-time spent in following the water and rowing together. Such a preparation is almost out of the question among amateurs; without it and in default of rigid coaching they can be beaten by the oarsmen of the poorest clubs, who are physically the weakest of oars. In college communities it is practically out of the question.

The record of the Oxford and Cambridge contests is instructive on this point, for it shows

how much can be done on very inadequate water by a thorough system of drill, which commences at the preparatory schools long before college is reached and is continued with increasing care as regards "form" and diet. At Eton and Harrow the boat clubs struggle with each other; at Oxford and Cambridge the crews of the several colleges are in constant rivalry; finally, out of all these crews the flower of the rowing men is picked to form the 'Varsity eight. Everything in the record of university boating goes to prove that intelligence, science, "good form," are the watch-words of success among amateurs. From another point the English record explains well enough how it is that American crews in Great Britain have scored few victories. Where have we in the United States amateurs or even college oarsmen who can pass through so many years of steady drill in the boat as Oxford or Cambridge men? The latter may be rowing with comrades who were fellow-oars at Eton seven years or more before.

There remains nothing, then, but the best kind of drill to fashion the raw material of American college youth in the course of six months into tolerable similarity of stroke; for unless this is done, defeat is certain. The writer has more than once undergone the agony of trying to shape a crew composed of young men in various walks of life, of various stature and strength, and filled with very different kinds of conceit, into a harmonious whole which should get the boat through the water at the quickest rate possible. The conclusion he came to was that each man should be taken in hand separately and forced to learn exactly the stroke of the stroke-oar; say by exercising him along with the stroke in a pair-oar, but discarding him at once if he is found too stupid or too headstrong to conform. If the club is large enough to contain a choice of good material, this can be done. No combination rowing should be allowed until it has been attended to. Rowing does not differ from other exercises in which united effort is absolutely necessary. Very often, indeed, it is the most experienced oar in a crew who does most to lose the race. He is wedded to his own ideas, or perhaps only to his own habits. Often he cannot learn another stroke even if he be willing, and his powerful efforts along lines differing slightly from those of him who sets the stroke impede the gait, imperceptibly, but very effectually, and in obvious cases cause the boat to roll. This is particularly observable when it comes to race-day; for then the old Adam rises in him, evoked by the excitement of the occasion.

Even when the coach allows the crew to sit in the boat, it is questionable whether at first long, wearying pulls, during which the

minds of the oarsmen wander and their several faults become hardened in them, are of use. It is better to make them paddle a little way and stop them — no matter how the ardent spirits among them may chafe, no matter how much cursing and grumbling is heard in the dressing-room afterwards. The great point is to teach them how to apply their strength all in the same way — at the same moment is of course. And the reason is simple. The Ward brothers bobbed every which-way, it is true, but by long practice the vicious bobbing of one was counteracted by the vicious bobbing of the other. One yawed over the side this way, but another yawed over the other. It is true that drill deadens the enthusiasm and makes some men spiritless; but the coach who is worth his salt knows when to apply the stimulus of enthusiasm, and, having first made machines of his crew, to spur them into putting their heart along the absolute lines he has obviously, however slowly, chalked out.

If I am not mistaken, this is the way Mr. Robert Cook went to work. He did not neglect practice; but he first studied the question, went where the best stroke obtainable at that time was rowed, took of that stroke whatever he thought good, and on his return to Yale played the autocrat with the utmost success. The oarsman who would not row his stroke had to get out of the boat; and in New Haven, that nest of petty politics and secret society nonsense, great was the to-do he raised by his arbitrary proceedings. But he beat Harvard every time, and the cackling of the old ladies with boy's faces, and sometimes with masculine gray hair, who potter about the undergraduate politics in Yale, was all drowned in the hurrahs of victory. In a less perfect way the same was true of Mr. William Bacon, the Yale stroke who achieved a series of victories at an earlier period. For his time he rowed the best stroke there was — short, it is true; with the body, it is true; mostly arm-work, it is true. But then everybody used their arms too much at that period, when the slide, gradually evolving itself from a pair of well-greased breeches that rubbed up and down a long seat made so that the grain of the wood ran fore and aft, was turning into a thin board running on oiled runners — an American invention quickly taken up in England and never discarded since.

If the old idea that putting college men into a boat and making them row ten miles a day without sharp coaching is no longer tenable, still less is it possible to deny the merits of the sliding seat. Hanlan could never have

made the time he has without this Yankee notion. It is now frequently balanced on glass balls that permit it to move with the least possible friction as the oarsman stretches forward to grasp the water.

The sliding seat equalizes the men in the boat who differ one from the other in length of trunk and limbs, permitting a man with a short reach to slide a little further than another with long arms, so to catch the water at the same angle and pull through a stroke of the same length. Without the slide no amount of rowing together would equalize the stroke: the short man would have to catch later or finish later than the long man, the result of which is, of course, unsteadiness in the boat and diminution of speed; for racing craft are so narrow that the blow of the blade as it takes water and the jerk as it leaves the surface are enough to give a lurch which causes the oars on the other side to foul at some point on the recover.

The sliding seat is based on the common-sense reasoning that the legs are furnished with muscles far more powerful than any other portion of the body. Which would you prefer to be hit with — the fist of a pugilist, or the foot of a Frenchman skilled in the curious and extremely unfashionable science of the *savate*? The latter with his heels can kill a man with one blow far more certainly, far more easily, than the former with his knuckles. Those great thigh and calf muscles contain a power little suspected by the average man. Well, the sliding seat enables the sculler to apply a very large fraction of that immense power to the blades of his oars, and, using the nearly unyielding water as the points of resistance to the longer arms of his fulcrum, to shoot the narrow hull like a javelin propelled from a throwing stick. The gain in swiftness is not a gain in picturesqueness. Look at Hanlan "loafing doubled up" over his sculls, reaching far forward with his hands, and catching the water far back of his seat. Then the bow twangs. His knees were under his breastbone just now, and his thighs and calves (they are not particularly big) were almost touching each other. Down go these levers, and the boat jumps like a trout you have inadvertently jogged while trying to tickle him into your hand. Then Hanlan gathers together in the same lazy, unpicturesque way — what! he's done it again! You turn away and remark to yourself that if he can keep up that sort of thing for twenty minutes, nobody unprovided with these new-fangled rowing-tanks, slides, swivel oar-locks, and wind-boards can hope to stay near him in a race.

Henry Eckford.

THE HUNDREDTH MAN.*

BY FRANK R. STOCKTON,

Author of "Rudder Grange," "The Lady, or the Tiger?" "The Late Mrs. Null,"
"The Casting Away of Mrs. Lecks and Mrs. Aleshine," etc.

XX.

MISS Matilda Stull, who really was on her way to invite Miss Gay Armatt to drive with her, was very much surprised when that young lady, in company with Mr. Stratford, rapidly passed her on the road. She turned quickly, and looked back at them, saying to herself: "Is it possible that I have been mistaken, and that that is the man she is engaged to? I don't understand it, for they certainly told me that the one I saw in the carriage with Mrs. Justin is named Crisman, and that he comes up every Saturday, on account of the engagement. But that doesn't look like it, I must say! And this is Saturday afternoon too!"

In all matters which pertained to love, engagements, or marriage Miss Matilda took a deep and abiding interest, and in this affair, so immediately within her observation, her interest was greater than usual. The apparent complications of it which had suddenly arisen in her extremely active mind, which needed but very slight impulses to set it working in matters of this sort, puzzled her exceedingly. She could not bring herself to give up her visit to Mrs. Justin's house, where she might hope to lay hold of some clew to this mystery. It was plain that Gay could not drive with her, but she saw no reason why she should not return Mrs. Justin's call, although her mother was not with her. That lady was as likely to be indisposed one day as another, and she could not afford to let the acquaintanceship she desired depend upon Mrs. Stull's dispositions or indispositions. If that Mr. Crisman were coming to-day, she knew the hour when he should arrive, and determined to plan her own drive so as to reach the house when he should be there. Mr. Stratford and Gay Armatt would be back by that time, and when she saw them all together she could judge for herself how matters stood.

Miss Stull drove about the country for some time, and when the proper hour arrived, she directed her coachman to turn the horses to-

wards the Justin house. There she found the lady of the mansion and Mr. Crisman, seated upon the broad piazza. Mrs. Justin received the young lady very cordially, and was on the point of stating that Gay had gone for a walk, but would certainly be back in a very short time, when Miss Matilda remarked that she supposed she might not see Miss Armatt as she had met her driving with Mr. Stratford, but that she had come all the same, because this was a call not only from herself but from her mother, who was extremely grieved that she was not able to make it in person.

At the intelligence thus conveyed by Miss Matilda the soul of Mrs. Justin was smitten by a sudden chill, and the face of Mr. Crisman grew stern and dark. This gentleman had been annoyed when he reached the house and found that Gay was not there to meet him, and had been talking to Mrs. Justin about the propriety of that young lady keeping her watch properly set and regulated, and carrying it with her when she went out for a walk, so that she would know when she ought to return to the house. But now, when he learned that she had not gone for a walk at all but was out driving with Stratford, his mind was a good deal darker than his face. He said nothing, but his eyes flashed angrily on Mrs. Justin. That lady glanced at him, caught the flash, and knew instantly that he believed she had told him a falsehood.

"I did not know," she said, addressing Miss Stull, "that Miss Armatt had gone driving. Mr. Stratford must have called for her while I was away, and they will doubtless return presently. And, before I forget it, Miss Stull, did your mother engage that washerwoman I recommended to her? If she does not suit, there is another one who might answer, but she lives at a greater distance."

During the discussion upon washerwomen which followed, Mr. Crisman arose, went into the house, and began to stalk up and down the parlor. A good deal of conversation, mostly on domestic subjects, now took place between Mrs. Justin and her visitor, and, to the great regret of both, it was not interrupted by the arrival of Gay and Mr. Stratford.

Miss Matilda stayed just as long as it was

possible to extend her visit; and this extension was encouraged by her hostess, who did not at all wish to be left alone with Crisman. Gay had done a very foolish and wrong thing in going away on this Saturday afternoon with Mr. Stratford, and it was she who should make the explanations and bear the reproaches. At last Miss Stull felt bound to admit to herself that the evening was coming on rapidly, and that she could not with propriety stay any longer, and so departed, disappointed. She had seen very little of Mr. Crisman, she had not made the acquaintance of Mr. Stratford, and she had learned nothing definite in regard to the engagement. She had seen enough, however, to make her believe that everything was not right, and that that young man who was walking so heavily about the parlor was very angry. This convinced her that he was really the engaged man, but she was sorry, very sorry indeed, that the couple in the buggy had not arrived before she left.

The heavens were kind to Mrs. Justin. She had not returned to the house after seeing Miss Stull to her carriage—and it must be admitted that she did not hasten that return—when Stratford and Gay drove up over the grass, coming from the back of the house.

The horse had no sooner stopped than Gay inquired of Mrs. Justin if Mr. Crisman had arrived, and on being told that that gentleman had been there some time and was now in the parlor, she bade Mr. Stratford a hasty farewell, skipped out of the buggy, and hurried into the house. As she hastened past Mrs. Justin, that lady felt assured that although Gay might be very anxious to meet her lover, her conscience as well as her affection had a good deal to do with the exceeding alacrity with which she went into the house.

"I had no idea," said Mrs. Justin to Stratford, "that you and Gay were going off to drive this afternoon."

"Nor had I," he answered. "I picked her up on the road. We had a most delightful drive."

"It may prove anything but delightful to Gay," said Mrs. Justin.

Stratford smiled. "I am very sorry," he said, "that upon this subject you and I should so frequently differ, both in our desires and our expectations."

"And I am also very, very sorry," said the lady.

And then Mr. Stratford drove away at supper time without being invited to stay to supper. This unusual omission was not due to want of hospitality or to resentment on Mrs. Justin's part. That lady did not desire an awkward situation at her evening meal, and Stratford understood her feelings perfectly.

That supper was indeed an awkward meal, but not as Mrs. Justin had expected it to be. She had looked forward to sitting at table with a black-browed and scowling lover upon whom the sweetness and kind attention of two ladies would make but very faint impression. Instead of that, only she and Gay had supper together; that is to say, they sat at table together, but neither of them ate much.

When Mr. Stratford had driven away, and Mrs. Justin had gone into the house after a stroll among the shadows on the lawn sufficiently prolonged to give Mr. Crisman time to get over the brunt of his indignation, she met Gay on the piazza, and immediately asked where Mr. Crisman was.

"I don't know," said Gay, her voice a little shaken either by emotion or shortness of breath. "I haven't seen him at all. Jane says he went out of the house and down the steps of the back piazza just as Mr. Stratford and I drove round to the front, and that she thought he went into the garden. I ran out there, and have been looking for him everywhere. What do you suppose has become of him? Can it be that he is angry with me, and has gone away?"

Mrs. Justin turned pale, and her paleness was reflected in the face of Gay. "Come into the library," said the older lady. And they went into the darkening room and sat down together on a lounge.

Now Mrs. Justin spoke to her young friend more plainly than she had ever spoken before. She opened her anxious heart to her, and with earnest affection explained to the young girl the danger she was in. Gay listened with a tear or two but with no words.

When Mrs. Justin had finished, Gay asked: "Do you think he will come back to-night?"

"I have no doubt of it" said the other. "He has probably gone for a long walk, which will cool off his anger; and when he comes back, my dear, it will be your duty to see that he has occasion to take no more such walks."

Then the two went out to supper.

About half-past nine that evening a boy belonging to the tavern at Cherry Bridge came to the Justin house bringing two letters. One was for Miss Armatt, and one was for Mrs. Justin, and they were both written by Mr. Crisman, who, the boy said, had taken his supper at the tavern and would stay there that night.

Gay, who had been reading and waiting and listening all the evening, took her letter in her hand but did not open it. The pallor on her face when instead of her lover there came this missive was not at all of the reflected sort.

"I think I will go up into my room and read it," she said. And taking a lamp, she went upstairs.

Mrs. Justin sent word to the boy that

he need not wait for answers, and then she sat and looked at her letter a long time before she opened it. She was so much averse to a correspondence with Mr. Crisman that once she made up her mind to tear up his letter and refuse to take part in a very unpleasant quarrel which she had earnestly endeavored to avert. But she knew that this would not be just, and she could not but believe that if she read Mr. Crisman's letter and treated him with courtesy, she might thereby be of great service to Gay.

Having come to this determination, she tore open the letter and read it. At the opening words her face began to redden, and as she went on the crimson glow increased. When she finished, the color died out of her face, and she leaned back in her chair and looked out between the parted curtains of the window into the dark night with an expression of somber sternness which was very unusual upon Mrs. Justin's lovely countenance. For a long, long time she sat thus; and it was after twelve o'clock when Gay came quietly into the room.

Mrs. Justin started with surprise. "Why, Gay," she exclaimed, "I did not expect you downstairs again!"

Gay made no answer, but advanced to the table with two letters in her hand, one open, and the other folded and addressed. Her hair was somewhat tumbled, as if her fingers had been in it; but her dress was unchanged, and she evidently had had no thought of retiring.

"Here is a letter," said Gay, laying the one which was folded and addressed upon the table, "which I should like to have sent to Mr. Crisman as early as possible in the morning. I have ended our engagement."

Mrs. Justin rose to her feet, her amazed eyes fixed on Gay.

"My letter is not sealed," said Gay, "and you can read it if you like. But I think it would be better if you read his letter first."

Mrs. Justin put out her hand for the letter which Crisman had written, and took it as though it were something hot which she feared to touch. She looked at Gay, and then she looked at the letter. Then she read a line or two, and put it down.

"I cannot, Gay," she said; "I cannot read it."

It was Gay who had been hard-stricken, but her nature was young and strong. She bore her blow better than Mrs. Justin bore the one she had received. "You need not read it," she said. "It would only pain you. I can tell you in a few words what is in it. He upbraids me cruelly for what he calls my faithlessness, and after saying a great deal for which there is no cause whatever, he orders me to write him a letter asking his forgiveness

for what I have done, and promising never to do again the things with which he has charged me. If I do not write such a letter and send it to him immediately, he declares that everything shall be at an end between us. In my answer I told him that his charges had no foundation at all, and that I would never write the letter he demanded. Did I do right?"

Mrs. Justin's face was flushed, not only by the words which Gay had spoken to her but by a hot recollection of the letter which she herself had received, in which Mr. Crisman had indignantly charged her with treachery and falsehood, with having encouraged and assisted the attentions of Mr. Stratford during the absence of Gay's rightful lover, and with having made him believe that Gay was out walking by herself when of course she knew that she was driving with that other man.

Never was there a woman who attached more solemn importance to an engagement or promise than did Mrs. Justin. Never was there a woman who looked with more horror upon the breaking of a compact upon which two loving hearts had entered, and yet she stretched out her arms to Gay, and pressing the girl to her bosom, she said: "You did right, exactly right!"

XXI.

WHEN Mr. Crisman, before breakfast the next morning, received Miss Armatt's letter, its effect upon him was to renew the anger which a night's sleep had somewhat sobered down. When he had written to her he had formed no conjectures in regard to her reception of his letter. He meant all that he had written, and his only desire and intent was that Gay should thoroughly understand what he meant. He had not cared to anticipate what she would do when she read it; but when he found what she had done, a most stubborn indignation took possession of him. His nature was one which hardened quickly beneath the sun of angry passion, and when this happened, neither rain, nor kindly warmth, nor the dews of night, nor any blessed breeze, could penetrate its crust.

"Very well," he said, as he tore up Gay's letter, "she loses more than I do." And then he went to breakfast.

The only resolve which Mr. Crisman now made was to the effect that every one should be made to understand that his engagement with the Armatt girl was broken off, and that he was not in the least crushed by the event. He had come prepared to spend a week at Cherry Bridge, having made arrangements by which his vacation came earlier in the season than usual. He had sent his baggage to the

tavern without saying anything to Mrs. Justin about it, preferring first to inform Gay of his intended stay in the neighborhood, and thus give Mrs. Justin an opportunity of inviting him to spend a week at her house. If she did not do so, he would stay at the tavern. But, although he had told no one of his intentions, he determined to make no change in them. This was a good place to hunt and fish, and he would stay here and hunt and fish for a week. Then he would go and spend the other week of his vacation in sailing, as he had planned. He liked sailing better than anything else, but having decided to give up half his holidays to the country in which Gay was staying, he would not allow her conduct to influence his plans in any way. If, in the course of his sojourn here, Gay should come to feel that she ought to be ashamed of herself, he would then determine what he would do. But this was to be entirely her own affair. Not one step would he take to lift her out of the pit into which she had deliberately thrown herself. If she chose to climb out and come to him—but he stopped here; he would make no promises, and offer no hopes, even in his own mind. He was obstinately angry.

On that Sunday afternoon Mr. Stratford walked over to the Justin house. He would have preferred not to go, but there were reasons why he thought it would be better for him to do so. Mrs. Justin had not treated him with her customary cordiality on the evening before, and he did not wish to appear to resent this by omitting his usual Sunday call. He had reason to believe, if he judged from nothing but Mrs. Justin's words, that he would not find the family atmosphere altogether bright and agreeable, but he did not feel himself justified in staying away on that account. If he found a storm there, or the signs of one, he would know that he was the cause of it, and there was no reason why he should shrink from his share of the rains and winds.

He was rounding the foot of an abrupt hill which lay on the extreme boundary of the Bullripple farm when he suddenly came upon a man who was making a shallow excavation in the soil with a small pickaxe. It was such an uncommon thing to find any one in this part of the country working in the fields on Sunday, that Stratford was quite surprised at the sight. In a moment, however, he perceived that this was not an ordinary laborer, but an elderly man dressed in black, who was, apparently, interested in geology.

"Good afternoon," said Stratford.

The man turned suddenly, and his face showed plainly that, whatever he might be looking for, it was not company. Stratford

could not imagine why the man should object to being seen digging for specimens of rock, fish worms, or anything else, unless it was on account of doing so on Sunday. He took no notice of the forbidding expression, and inquired pleasantly what there was to be found on this hillside.

"Nothing," said the man, dropping his little pick. "There's nothing at all in land like this, either inside of it or on top of it. I live in this county, though not in this stony part, and I like to know what kind of soil we've got in one place and another. But this land ain't worth the trouble of scratching it."

"It does not appear to me in that light," said Stratford. "The pasturage is fair, and the crops in the valley lands are very good."

"Oh, yes," said the man. And as he spoke he kicked some stones and loose earth into the hole he had made. "Some of the land is good enough for crops, but there is nothing in it that is really worth anything."

"I suppose you are alluding to ores," said Stratford. "From what I have observed in sections of the country where iron is found, I should think there might be ore of that kind here."

"Humph!" said the man. "You might dig here for ten years, and you wouldn't find no iron except what was worn off your shovels and picks. Good-day to you." And taking up his pickaxe and a stout grape-vine cane which lay on the ground, the man walked away towards the village.

Stratford continued on his way, but in a few moments he stopped and looked back. The man was carrying the little pickaxe under his coat. Stratford smiled as he went on. "I cannot imagine," he said to himself, "why he should have been so disturbed at my seeing him. He could not have been stealing anything, for there is nothing here to steal. I am afraid that after going to church this morning he intended going fishing this afternoon. He chose a very poor place, however, in which to look for bait."

Stratford was met by Mrs. Justin before he reached the house. "I saw you coming over the hill," she said; "I want to have a little talk with you before you go in." And then, as the two walked down to the bank of the creek, she said: "Your work is accomplished. The engagement between Gay Armatt and Mr. Crisman is broken."

"What!" exclaimed Stratford. And for a moment he felt a pang of contrition. He had greatly desired to see this engagement broken off, but it was a shock to be suddenly told that there had been a rupture, and that he had made it. But Mrs. Justin's next words were positively astounding.

"I would not have told you this so abruptly," she said, "if I had not intended to also say that I am very glad that everything is at an end between these two."

"You doubly amaze me!" cried Stratford. "Is it possible I have converted you?"

"Not a bit of it," promptly answered Mrs. Justin. "You were wrong, wrong, absolutely wrong in what you did. You had no more right to come between those two than you had to try to come between any other man or woman, either engaged or married. It so happens that you have done a good thing, but you deserve no credit for it. You did not know Mr. Crisman; you merely had a prejudice against him, and for no reason but this you endeavored to make a girl forswear herself."

"A strong statement," remarked Stratford.

"None too much so," continued the lady. "I have come to believe that what you did has had a most excellent result, but, for all that, it was a very wrong thing to do; it was a crime. Now that Mr. Crisman is out of the way, everything is free and open to you, and in the course of time I suppose that you and Gay will be married. I have no doubt that you will both be very happy, and that neither of you could possibly have made a better match. But, for all that, you ought never to look back upon the part you have played without sorrow and repentance."

"I wish to heaven," exclaimed Stratford, "that the words I have spoken to you about Miss Armatt and myself could be believed! But I suppose this is too much to expect, and we need say no more about it. If you do not object, I should like to know how this thing happened, and what is the present state of affairs."

"As you are a party very much interested," said Mrs. Justin, "of course you ought to know all about it." And then she went on to tell him what had happened. She repeated the substance, as she had heard it, of Crisman's letter to Gay; told him what Gay had written in answer; and how she had heartily supported the girl in her resolution.

In regard to the letter which she herself had received from Crisman, and which had done more to show her the true character of the man than even what he had written to Gay, she said but little. If she had told what that letter contained she would have had good reason to fear that Stratford would have thrown the young man into Cherry Creek, or that he would have been thrown into that stream himself.

"I cannot be too glad," said Mrs. Justin, in conclusion, "that the man, before it was too late, showed us his true character, and that he himself made it impossible for the engage-

ment to continue. But I shall never cease to grieve that my friend chose to take the part that he has played in this affair."

"Knowing you as I do," said Stratford, "I am quite sure that I like you better for that opinion."

A meeting between the girl whose engagement of marriage had suddenly been broken off and the man who had been the cause of such fracture must naturally be an awkward one, and feeling this very strongly Stratford was not anxious for an immediate interview with Gay. If he had known what serious consequences had followed his mountain ride with Gay he would have postponed for a day or two his visit to this house. Thoughts of this awkwardness may have come into the mind of Mrs. Justin also, but if they did she allowed them no weight.

"Gay is in the house," she said, "and you may as well see her at once. You know how the matter stands, and it will not be pleasant or wise for any of us to put ourselves in stiff or constrained positions."

When Stratford took Gay by the hand and looked into her face he saw that she had had a hard blow, one that might have crushed her if, at the same time that it wounded her, it had not aroused the most emboldening sentiments of self-respect and just resentment. She was not a girl who would parade an affliction or misfortune by retiring on account of it from the society of her ordinary friends and associates. Nor was she one who would care to conceal a trouble from those who took an interest in her life and happiness. She was aware that Stratford knew what had happened, for she had asked Mrs. Justin to tell him, and as this was the most important event of her life, not even excepting her engagement, she could not bring herself to avoid the subject with Stratford, whom she believed to be her true friend, and whose mind she knew must be occupied with it. As he probably understood that their innocent drive had brought about the catastrophe, and as she believed that no blame should attach to him, she wished him to see that she intended to visit him with no punishment, negative or positive. She did not know much and had never thought much of the way in which the world is in the habit of forming its opinions, but her good sense and experience were quite sufficient to show her what kind of opinion might easily be formed in a case like this, where the former lover had torn himself away and where the engagement-breaker continued in favor; and she was very desirous that that part of the world represented by Stratford should not have a mistaken opinion.

"You know," she said, as soon as they had

taken their seats, "that Mr. Crisman and I are no longer engaged?"

"I have heard it," said Stratford.

"It was all very sudden and unexpected," she continued. "I have been greatly distressed, and Mrs. Justin also, and we are not ourselves at all. But we hope our friends will not find fault with us any more than we find fault with them."

As she said this Stratford looked steadfastly at her, but made no answer.

"I don't care to talk about this any more than I can help," she continued, "and all that we can do is to wait, and hope for the best."

"What is the best?" asked Stratford.

"The best thing that could possibly happen," said Gay, "is for us to find ourselves able to come together on our old ground, when everything can be so easily explained. Mr. Crisman knows, as every one knows, that I always have been, and am now, perfectly loyal to him."

This assertion greatly surprised Stratford, and in his heart he did not believe it.

"I do not understand you," he said. "How can you be loyal to him when you have seen fit to break your engagement to him?"

"I don't know that I can exactly explain myself," she said, "but I want to make it understood that while I am not willing to be engaged to Mr. Crisman so long as he holds the position he has taken, I have never turned aside from any of my promises; and when I find him as he was a week ago he will find me exactly what I was then. Is that plain?" And she looked with anxious inquiry at Stratford.

"Oh, yes, quite so," he said to her. But he said to himself that Crisman could never be to her the same man that he was a week ago. He saw her object: she wished to establish the fact that there had been no unfaithfulness on her part.

Here now was an opportunity to do a thing which Stratford considered righteous, honorable, and kind. Here was a chance to tell this girl that she had done all that the world and her conscience called upon her to do; that after what had happened, the loyalty of which she spoke could be but a thing of principle without feeling; that the reasons which prompted her to break off the engagement were just as strong reasons why she should never think of it again, and that, setting arguments and words aside, she should embrace, with all the force of her nature, this opportunity of escaping a ruined life. But he said nothing of all this. He was a brave man, and an able one, but he shrank from the task of doing what he thought to be his duty. He did not believe he could give her the counsel he wished to give, and at the same time maintain the position he wished to keep.

"It will be better," he thought, "that she

should find out these things for herself, and I am sure she will do it. And, besides, she has Mrs. Justin to back her."

Under the circumstances, the hours could not be expected to pass in a cheery way; and, soon after supper, Mrs. Justin and Stratford found themselves sitting alone in a very quiet house.

"I cannot quite understand Miss Armatt's demeanor," said he. "If she is deeply grieved at the dissolution of her engagement, I should expect more evident signs of distress; and, on the other hand, if she is glad of her great deliverance, I should think she would let that be seen. As it is, it would be very difficult to classify her apparent emotions."

"I believe," said Mrs. Justin, "that Gay does not thoroughly understand herself. As far as I am able to judge, her mind is now occupied in assuring her that she has always stood by her promises, and that her steadfast fidelity gave her a right to break with a man who insisted that she should admit that she was not true to her given word."

"So long as she reasons," said Stratford, "the state of the case is perfectly satisfactory. But what surprises me more than anything else is the readiness with which you accept the situation. I should have supposed that no matter how bitter the quarrel between these young people, you would have hoped to see them reconciled and the engagement renewed."

"I am quite willing to admit," said she, "that it is not at all like me to feel the satisfaction and thankfulness that I do feel in knowing that Gay is not to marry Mr. Crisman. But this is a very unusual case, and my conscience fully justifies me." And then, in her mind, she added: "If you could have read Mr. Crisman's letter to me you would not wonder at my feelings."

XXII.

THERE was not at this period a more ardent match-maker in the country than Mrs. People. For a long time she had been much dissatisfied with the condition and prospects of her son John. For one thing, he was growing up to be an old bachelor, and she was opposed, on principle, to old bachelors. To be sure, it was a very fortunate thing for her that her brother Enoch belonged to this class, for otherwise it is not at all probable that she would have been at that time the mistress and director of the household; but the principle remained unchanged. Mr. People was not much more than twenty-one when he married her; and here was John, who in four short years would be thirty, still single. It was plain enough she thought that he was beginning to be a man of

importance in his business, for otherwise old Vatoldi would never have allowed him to manage his affairs all by himself during the late disturbances. His having a vacation, too, showed that things were getting to be better with him; and what was next to be expected was an increase of salary. Taking all these matters together, it was as clear as the light of day in Mrs. People's mind that John should lose no time in getting married.

And here was Matilda Stull; and if anybody knew of a better match for John than she was, Mrs. People would like to see that girl, be she black haired or brown, a foreigner or a native-born American, produced at once. It was not only that Miss Stull was a very pretty girl, and very well dressed, and one with whom John was deeply in love, but there was an eminent propriety in marriage between the heir of her house and that of Stull, which loomed up in a gigantic form in the mind of Mrs. People. If John married Matilda, the farm on which he was born would, in the course of time, come into his possession; and this, from Mrs. People's point of view, was the most desirable thing that could possibly happen.

She would sit, in one hand a table-knife with its blade half-ground away by repeated sharpenings, and in the other a partly peeled potato, and muse upon the happiness, the absolute felicity, which would be hers when the old farm should belong to John. To buy back this estate appeared to her a simple impossibility; to get it for nothing by means of this marriage would be a grand stroke indeed.

Many were the plans she formed while the potato waited to be peeled. She would go and live with John, for it was not likely that that city girl knew anything about housekeeping or the management of a dairy. And yet as she, Mrs. People, could not expect to live forever, it would be necessary that her son's wife should learn how to manage his household affairs. Matilda, for thus the good woman already thought of her prospective daughter-in-law, should do some things, and thus gradually learn the duties of her position. She could begin by washing up the tea things and feeding the chickens. In course of time she might be able to take charge of the churning, although Mrs. People very much doubted if that girl could ever produce such butter as she now set before her son.

On the other hand, it would be very hard for her to leave her brother Enoch, who was getting somewhat oldish now, and must sometimes feel a little stiff in his joints, although he never mentioned anything of the sort. She had lived a long time with her brother, and in some respects he had become as necessary to her as she was to him. And yet, how would

it be possible for her to give up that desire of her life, to live once more in the house and on the farm to which Mr. People had taken her as a bride?

These conflicting feelings troubled her greatly, and she would sometimes sit and muse upon them much longer than was conducive to the regularity of the dinner hour. One day, however, a consoling thought came to her. It was possible, nay it was even more, it was very probable, that Matilda had in her composition a good deal of spice, and not only such spice as ginger, cinnamon, and cloves, but pepper, and good hot red pepper, too, if Mrs. People knew anything about the outward signs of a woman's disposition. Now, this peppery disposition might make the situation of a mother-in-law in John's home a very unpleasant one, and it might be well, therefore, that she should remain in her present very comfortable position in her brother's house. It was truly comforting to the mind of Mrs. People to settle this vexing question by reflecting that in all probability Matilda would be too peppery to live with; and the remainder of the potato was peeled.

It was not so easy, however, for John People himself to settle the question of Matilda Stull. He was now having opportunities for forwarding his suit which a short time before he would not have believed possible. He was living near fields through which Miss Stull walked and wandered, and where she had actually allowed him to walk and wander with her. He had nothing to do, and could walk and wander when he pleased. But the days of his vacation were rapidly passing, and he had done nothing decisive yet. At any moment he might expect to hear that the alterations at Vatoldi's had progressed so far that it was necessary for him to go to the city and take charge of affairs. If he could again be alone with Miss Stull, and could make up his mind to show her the state of his feelings, he believed he ought to do it. In the city he had worshiped her from afar, and had never believed that there was the slightest chance of possessing her; but here in the country, where people were ever so much more the equals of each other, he had worshiped her at a distance of a foot, or perhaps eighteen inches; and if a young lady was willing to walk with a young man through fields and gates so close as that, John thought that young man ought to be greatly encouraged, and might feel justified in speaking out his mind.

In regard to what old Stull might say, in case of a favorable reply from the daughter, John was not over-sanguine. It was true that now, being a partner in the concern, although with a very small share of the profits, it might

be possible that Mr. Stull would turn a favorable eye upon a connection which would, in a way, make the whole business a family affair. But, in spite of this encouraging thought, if John had been compelled at this time to make his proposals to the father instead of the daughter, he would have calmly resigned himself to perpetual bachelorhood. But, should he be accepted by Miss Stull, he would wait and bear to any extent.

John's mind was in this condition when, one fine morning, Miss Matilda paid a visit to the Bullripple household. To John and his mother she came like an angel with white wide-spreading wings; to old Enoch she appeared as an uppish young woman with a cattle-irritating parasol; and to Mr. Stratford, who regarded her from his window, she was an enigma. He knew who she was, but he could not imagine why she should come to that house and sit with John People under the great tree in the front yard. Miss Stull had really called upon Mrs. People, but that sagacious mother had sent John to say that she would be out in a very few minutes, and had told him that he must entertain the visitor until she came. Mrs. People was devoured by desire to know the object of Miss Stull's visit, but she restrained herself for the love of John. It was a heroic sacrifice, but she made it, and for ten minutes sifted sugar over a mass of bread dough without knowing what she did.

Miss Stull was very desirous that Mrs. People should come out; she wanted to ask her a lot of questions; but she did not betray any impatience towards John. The young man might be useful to her, particularly in the way of making her acquainted with Mr. Stratford, if the chance should occur. Miss Matilda wished very much to know the handsome gentleman she had seen driving with Gay Armatt. She had not supposed when she came to this part of the country that she should find such a man as that. She was therefore very gracious to John, and asked him so many questions about the present composition of the Bullripple household that the young man was obliged to say a good deal about Stratford, and could not have failed to present him had he made his appearance.

When she had waited just as long as she could, having, in the meantime, made her dough all cake, Mrs. People came out, and John was constrained to walk away reluctantly, to give the young lady an opportunity of stating her business to his mother. He did not go very far, however, but busied himself about the wood-yard, from which point, with his face ever turned towards the object of his devotion, no matter how he might move and re-

volve, he held himself ready, the instant the conference should be over, to accompany Miss Stull to the gate and to go with her as far over our continent as she would permit.

What Miss Stull came to find out was the true state of things in the Justin house. Was Miss Gay engaged to the young man who was walking about in the parlor without her, or to Mr. Stratford, whom she had seen driving with her? In what business was this Mr. Crisman, and was he related to Mrs. Justin? Was Mr. Stratford rich? Was Mrs. Justin entirely satisfied with Gay's match? All these things, and a number of other points, Miss Stull had hoped to learn from Gay; but having failed to see that young lady, and not being able to wait until her call was returned, she had made a swoop upon Mrs. People.

After some very thin talk about butter and eggs, Miss Stull found it easy to introduce the subject she had at heart. Mrs. People had also a subject at heart which she wished to introduce, and in order to get at it she rushed with haste and freedom into the subject presented by her visitor. She told Miss Stull so much, in fact, that that young lady turned pale with surprise, and then pink with delight, at being the recipient of such startling information. Mrs. People had been at Mrs. Justin's house, and as that lady was desirous that it should be generally known that Mr. Crisman was no longer engaged to Miss Armatt, she had informed Mrs. People of the fact, and that good woman had easily possessed herself of as much of the detail of the event as Mrs. Justin judged proper to give her. This information, rapidly and generously garnished from the resources of her own mind, Mrs. People laid before Miss Stull.

The interview was protracted so long that John's ingenuity was greatly taxed to keep himself busy in view of the couple under the tree. When Miss Matilda rose to go, thus interrupting an abruptly introduced maternal panegyric of the manager of Vatoldi's, her mind was filled with a pleasing consciousness that there was in this neighborhood a city gentleman, handsome and stylish, and not engaged to be married. What advantage to herself she expected to result from this Miss Stull might not have been able to state in clear and convincing terms. But it was a great satisfaction to a person of her temperament to know that the facts were as they were.

John was with her before she reached the gate, and opened it for her. Then she stopped.

"Isn't there some way, Mr. People," she said, "by which I can go home across the fields instead of walking by the side of this monotonous road?"

"Oh, yes," said John, "but there are fences

in the way, and draw-bars would have to be taken down."

"And isn't there anybody," she continued, "who can take down those bars?"

To hear this question, and to see at the same time the meaning little smile on the face of the young lady who asked it, suffused John's soul with more actual joy than it had ever before known. Yes, indeed, there was somebody who could not only take down bars, but who would tear away walls, fill up ditches, and slay bulls, if necessary. John did not say this, but his manner indicated it.

As they walked across the fields, Miss Matilda's spirits were very lively, and her manner was very cordial. She had no idea of alluring this happy fly into her web, but she desired to make of him a thread-carrier, so to speak, who would take out beyond her present sphere of action those finely spun inducements by which she hoped to draw to herself the larger and brighter flutterer upon whom her eyes were fixed. John now lived with Mr. Stratford, and through him her very limited circle of acquaintance here might be enlarged by the addition of this gentleman. She considered it her right to know every presentable man who might find himself within the limits of her social range.

Miss Stull also hoped to make Mr. Stratford comprehend through John what an exceedingly desirable thing it would be to become acquainted with her. But her methods towards this end had only the effect of causing John to feel that she was a more charming, desirable, and gracious superior being than even she herself had ever supposed it possible for her to become. On his side he was emboldened to a point of courage he had not imagined he could reach. Before they had gone three-quarters of the distance through a clover field, John determined to make his sentiments known. He would not ask her plumply if she would marry him, as if she were a mere country girl, but he would show her his glowing soul. Had she not with the sweet words and enrapturing smiles of angels deliberately set it on fire? And was it not due to her that she should see that it had kindled?

"Another set of bars!" exclaimed Miss Matilda, as they approached the fence. "Oh, dear, Mr. People, what a deal of trouble I am putting you to!"

"Trouble!" exclaimed the sturdy John. "I wish I could take down every bar that you might meet with through your whole —"

"Way home," quickly interpolated Miss Matilda. "That is just what I want you to do. You are so strong and seem to understand these fences so well."

"That is not the point," said John, as he

seized a rail and jerked it from its sockets. "Other people might be able to take down bars —"

"Yes," interrupted Matilda; "Mr. Stratford, for instance. He has lived so much in this country that I suppose he knows all about such things."

"It isn't the being able to do it," said John, looking intently into the face of the young lady, "it is the wanting to do it."

Miss Matilda smiled upon him. "It is very good of you," she said, "to be willing to do for other people what they cannot do for themselves. Now, if I were walking here alone I could never lift those heavy rails, and would have to crawl through the fence, or to climb over it as best I might."

"If I had my way," exclaimed John, forgetting in his excitement as he walked by Miss Matilda that it was necessary to put up the bars he had taken down, "there should never be in the way of your feet a stick, a stone, a clod, a lump, not so much as a piece of gravel."

"Those things must be expected," said the young lady with demure triteness.

"Oh, no, they needn't be!" cried John in quick and fervid tones. "They need never be known at all, if there is one ever ready to brush and hurl them away; to make your paths as smooth — as smooth as roses."

"Which are not smooth," said Miss Matilda, "at least not when they are used to make a path of. That reminds me that at our house there are a lot of rose bushes, and some of them have flowers on yet, but mother and I both think that they are a poor kind of rose bushes, and that if we are to come up here in the summer time we might as well have some good ones planted. Do you know the names of some good roses that would grow here? Perhaps, if you don't, Mr. Stratford could tell you. City men are so apt to know the names of good kinds of things."

"I am a city man myself," said John in a tone somewhat different from that in which he had just spoken, "and I'll get you all the roses you will ever want."

"I don't want you to get them," said she. "I only want the names of them. And there is another thing I would like to ask you about. How do you make grass grow? Mother and I think there ought to be a great deal more of it about the house, but the farmer who lives there don't seem to understand how to plant it."

With well-plied questions concerning the adornment of their country home Miss Matilda engaged the attention of her companion until they had reached the last fence. Then she turned and held out her hand.

"Good-bye, Mr. People," she said. "There are now no other obstructions between me and the house, and I will not make you go any farther."

"There is an obstruction, Miss Stull," said John very earnestly, "an obstruction to my every joy, which —"

"Oh, yes, I know," quickly interrupted Miss Matilda; "those dreadful waiters who boycotted your place. It must be an awful obstruction, but it is bound to disappear in time, if you stand up boldly. Father has talked about it, and he says so. He is very fond of Vatoldi's, and he says we must go there again as soon as things are all right. Good-bye, Mr. People." And, with one of her pretty smiles, she tripped away.

Regarding the state of affairs from John's point of view it was quite evident that angelic beings have their disadvantages, for their beautiful wings enable them to keep just out of one's reach without feeling at all compelled to flee the company of the one who wishes to reach them.

On the other hand, Miss Matilda, in her character of web-maker, discovered that a fly who may be sent out to inveigle other insects is apt to become entangled in a very troublesome and apparently hopeless manner in the subtle threads with which he has been intrusted.

This young lady, however, troubled herself very little about John's condition. She liked to see a young man in this sort of involvement, especially when she herself had produced it, and her only regret in the present case was that the young man probably could not prove as useful as she had expected him to be. The most important object of her life at the present moment was to become acquainted with Mr. Stratford. It made her positively angry to think that she did not know him, and that she saw no way open by which she could become acquainted with him. She had called twice at the house where he lived, and accident had not favored her. She made a visit at Mrs. Justin's at a time when he was expected there, but she had not met him. She had hoped to know him through Gay Armatt, but she was now in trouble and could not be expected to do much in the way of introducing gentlemen. Miss Matilda's acute mind had discovered what sort of person was Mrs. People, and she was afraid to allow that good-hearted but exceedingly open-natured woman to know that she positively wished for the acquaintance of Mr. Stratford. Had she done this Miss Stull might have expected to be placed in a very undesirable position by the irrepressible frankness of Mrs. People. John had been her chief dependence, but she was

now very much afraid that she would not be able to make use of him. He had become so addled that he could not understand any hints of her desires, and she was even afraid that if she should succeed in making him understand what she wanted the numskull would actually refuse to make her acquainted with a man who might prove to be a rival.

There was nothing to be done but to depend upon herself; and as Miss Stull was quite used to this sort of dependence, she was not long in forming a plan. She must meet the man by accident. In a country place like this, where people wandered about as they pleased, this ought not to be a difficult matter; and as Mr. Stratford had probably by this time heard of her, and as he knew of course that she had heard of him, they would not meet as positive strangers, and a chance encounter might be worked up to advantage.

Miss Matilda was rather fond of sketching, and although she had but small ability as an artist, she was extremely clever in a general way, and could so arrange her slight artistic gifts that they made a very good show. The weather being now quite suitable for outdoor sketching, Miss Stull arrayed herself in a most becoming and appropriate costume, and with a sketch-book and little camp-stool under one arm, and a large umbrella with a long, pointed handle over her right shoulder, repaired to a pleasant spot at the foot of the hills, where some very good views could be had, and close by which she had sometimes observed, from a distance, that a sportsman occasionally passed on his way to the trout streams on the higher grounds.

The sketcher did not immediately select a spot at which to begin her work. She rambled about a good deal, and looked about a good deal, in order to see what suitable thing there was in view which might be drawn. At last she decided upon a distant view which included a path that led through the Bullripple farm towards the village.

Miss Matilda was a lucky young woman, especially when she put her own shoulder to her wheel of fortune, and she had scarcely sketched in the outlines of some rocks and gentle eminences when she saw coming towards her, among these outlines, a gentleman with a fishing-rod upon his shoulder. For some minutes she kept her eyes fixed upon her paper, and then, giving a little shrug to her shoulders and looking up at the sunlit sky, she put down her book and picked up the umbrella, which lay, closed, on the ground by her side. The pointed end of the long handle she now endeavored to thrust into the ground, but she found this a difficult performance. In one place the soil seemed very hard, in another there was long, tangled grass,

and, after a jab or two, she decided that she would not like to sit there. After some deliberation, with her back to the object she intended to draw, she selected another spot, but here she found a large stone just under the surface of the ground. Having quarried on this for some moments, she stopped and began fanning herself with her handkerchief. Such exertion was certainly very unusual with her, and she stood, panting a little. The man must now be very near.

In less than a minute she heard a step, and a gentleman's voice said to her: "Allow me, miss, to plant your umbrella for you."

She turned quickly and saw, not Mr. Strat-

ford, but Mr. Crisman. She knew him the moment she saw him, and was now truly surprised, for she had supposed that when he had ended his engagement he had also ended his visit to these parts. But her soul did not shrink with disappointment. This was a very handsome young fellow, and she would be delighted to know the ex-lover of Gay Armatt, about whom she had had so much curiosity and so much doubt.

With an ingenuous smile she accepted his offer, and the strong arm of Mr. Crisman soon fixed the handle of the umbrella in the ground as firmly as if it had been the mast of a boat.

Frank R. Stockton.

THE NAME OF WASHINGTON.

[Read before the Sons of the Revolution, New York, February 22, 1887.]

SONS of the youth and the truth of the nation,—
 Ye that are met to remember the man
 Whose valor gave birth to a people's salvation,—
 Honor him now ; set his name in the van.
 A nobleness to try for,
 A name to live and die for—
 The name of Washington !

Calmly his face shall look down through the ages —
 Sweet yet severe with a spirit of warning ;
 Charged with the wisdom of saints and of sages ;
 Quick with the light of a life-giving morning.
 A majesty to try for,
 A name to live and die for —
 The name of Washington !

Though faction may rack us, or party divide us,
 And bitterness break the gold links of our story,
 Our father and leader is ever beside us.
 Live and forgive ! But forget not the glory
 Of him whose height we try for ;
 A name to live and die for —
 The name of Washington !

Still in his eyes shall be mirrored our fleeting
 Days, with the image of days long ended ;
 Still shall those eyes give, immortally, greeting
 Unto the souls from his spirit descended.
 His grandeur we will try for ;
 His name we'll live and die for —
 The name of Washington !

George Parsons Lathrop.

ABRAHAM LINCOLN: A HISTORY.*

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

THE ATTACK ON SUMNER, AND THE DRED SCOTT CASE.

CONGRESSIONAL RUFFIANISM.

HE official reports show that the proceedings of the American Congress, while in the main conducted with becoming propriety and decorum, have occasionally been dishonored by angry personal altercations

and scenes of ruffianly violence. These disorders increased as the great political struggle over the slavery question grew in intensity, and they reached their culmination in a series of startling incidents.

Charles Sumner, one of the Senators from the State of Massachusetts, had become conspicuous, in the prevailing political agitation, for his aggressive and radical antislavery speeches in the Senate and elsewhere. The slavery issue had brought him into politics; he had been elected to the United States Senate by the coalition of a small number of Free-soilers with the Democrats in the Massachusetts legislature. This question, therefore, became the dominant principle and the keynote of his public career. He was a man of profound culture, of considerable erudition in the law, of high literary ability, and he had attained an enviable social eminence. Though of large physical frame and strength, the combative quality was almost totally lacking in his organization, a lack, however, which was fully compensated by a moral fearlessness that led him to give free utterance to his convictions.

In this spirit he joined unreservedly in the exciting Senate debates, provoked by the rival applications from Kansas for her admission as a State. On the 19th and 20th of May, 1856, he delivered an elaborate speech in the Senate, occupying two days. It was one of his greatest efforts, and had been prepared with his usual industry. In character it was a philippic rather than an argument, strong, direct, and aggressive, in which classical illustration and acrimonious accusation were blended with great effect. It described what he called "the crime against Kansas"; and the excuses for the crime he denominated the

apology tyrannical, the apology imbecile, the apology absurd, and the apology infamous. "Tyranny, imbecility, absurdity, and infamy," he continued, "all unite to dance, like the weird sisters, about this crime." In the course of this speech he alluded, among others, to Senator Butler of South Carolina, and in reply to some severe strictures by that Senator during preceding debates indulged in caustic personal criticism upon his course and utterance, as well as upon the State of South Carolina, which he represented.

"With regret," said Sumner, "I come again upon the Senator from South Carolina [Mr. Butler], who, omnipresent in this debate, overflowed with rage at the simple suggestion that Kansas had applied for admission as a State; and with incoherent phrases discharged the loose expectoration of his speech, now upon her representative and then upon her people. There was no extravagance of the ancient parliamentary debate which he did not repeat; nor was there any possible deviation from truth which he did not make, with so much of passion, I am glad to add, as to save him from the suspicion of intentional aberration. But the Senator touches nothing which he does not disfigure—with error, sometimes of principle, sometimes of fact. He shows an incapacity of accuracy, whether in stating the Constitution or in stating the law, whether in details of statistics or the diversions of scholarship. He cannot open his mouth but out there flies a blunder."

Butler was not present in the Senate on either day: what he might have said or done, had he been there, can only be conjectured. The immediate replies from Douglas and others were very bitter. Among pro-slavery members of both Houses there was an under-current of revengeful murmurs. It is possible that this hostile manifestation may have decided a young member of the House, Preston S. Brooks, a nephew of Senator Butler, to undertake retaliation by violence. Acquainting Edmundson, another member, with his design, he waited on two different occasions at the western entrance to the Capitol grounds to encounter Mr. Sumner, but without meeting him.

On the 22d of May, two days after the speech, Brooks entered the Senate Chamber on the same errand. The session had been short, and after adjournment Sumner remained at his desk, engaged in writing. The sessions were at that time held in the old Senate Chamber,

PLAN OF SENATE CHAMBER, 1ST SESSION 34TH CONGRESS.
9. Sumner's desk. 15. Where Brooks sat. X. Where Sumner fell.

now occupied by the Supreme Court. The seats were arranged in semicircles, with a railing to separate them from a narrow lobby or open space next the wall; a broad aisle ran from the main door to the desk of the presiding officer. Mr. Sumner's seat was in the outside row next to the railing, at the second desk to the right from the entrance and the main aisle. Occupied with his work, Mr. Sumner did not notice Mr. Brooks sitting across the aisle to his left, and where in conversation with a friend he was manifesting his impatience that a lady seated near Mr. Sumner did not take her departure from the chamber. Almost at that moment she probably arose and went out, for quickly afterwards Brooks got up and advanced to the front of Sumner's desk. The fact attracted the attention of Brooks's friend; he was astonished, amid the bitterness of party feeling, to see a South Carolina Representative talk to a Massachusetts Senator. His astonishment was quickly corrected. Leaning upon the desk and addressing Sumner with a rapid sentence or two, to the effect that he had read his speech, that it was a libel upon his absent relative, and that he had come to punish him for it, Brooks began striking him on the head with a gutta-percha walking-cane, of the ordinary length and about an inch in diameter.

Surprised, blinded, and stunned by the blows, Sumner's first instinct was to grapple with his assailant. This effort, however, was futile; the desk was between them, and being by his sitting posture partially under it, Sumner was prevented from rising fully to his feet until he had by main strength, in his struggles, wrenched it from its fastenings on the floor. In his attempt to follow Brooks they became turned, and from between the desks moved out into the main aisle. By this time, through the repetition of the heavy blows, and loss of blood, Sumner became unconscious. Brooks, seizing him by the coat-collar, continued his murderous attack till Sumner, reel-

ing in utter helplessness, sank upon the floor beside the desk nearest the aisle; one row nearer the center of the chamber than his own. The witnesses variously estimated the number of blows given at from ten to thirty. Two principal wounds, two inches long and an inch deep, had been cut on the back of Sumner's head; and near the end of the attack, Brooks's cane was shattered to splinters.

There were perhaps ten or fifteen persons in the chamber, and after the first momentary pause of astonishment half a dozen started to interfere. Before they reached the spot, however, Mr. Keitt, another South Carolina member of Congress, came rushing down the main aisle, brandishing his cane, and with imprecations warning lookers-on to "let them alone." Among those hastening to the rescue, Mr. Morgan arrived first, just in time to catch and sustain the Senator as he fell. Another bystander, who had run around outside the railing, seized Brooks by the arm about the same instant; and the wounded man was borne to an adjoining room, where he was cared for by a hastily summoned physician.

Among Mr. Sumner's friends the event created a certain degree of consternation. The language which provoked the assault, whatever might be thought of its offensive character, was strictly parliamentary, uninterrupted either by the chair or by any member. The assault itself was so desperate and brutal that it implied a vindictiveness deeper than mere personal revenge. This spirit of bullying, this resort to violence, had recently become alarmingly frequent among members of Congress, especially as it all came from the pro-slavery party. Since the beginning of the current session, a pro-slavery member from Virginia had assaulted the editor of a Washington newspaper; another pro-slavery member, from Arkansas, had violently attacked Horace Greeley on the street; a third pro-slavery member, from California, had shot an unoffending waiter at Willard's Hotel. Was this fourth instance the prelude of an intention to curb or stifle free congressional debate? It is probable that this question was seriously considered at the little caucus of Republican Senators held that night at the house of Mr. Seward. The Republicans had only a slender minority in the Senate, and a plurality in the House; they could do nothing but resolve on a course of parliamentary inquiry, and agree on an attitude of defense.

Sumner's colleague, Mr. Wilson, made a very brief announcement of the occurrence to the Senate on the following day, and it at once became apparent that the transaction would assume an almost strictly party char-

acter. As no Democratic Senator proposed an inquiry, Mr. Seward moved for a committee of investigation; upon which Mason of Virginia proposed that the committee should be elected by ballot. The result was that no Republican was chosen upon it; and the committee reached the conclusion that it had no

tenancing the assault, and of the act of Keitt in his personal interference. But the necessary two-thirds vote for the expulsion of Brooks could not be obtained; a vote of censure was therefore passed by a large majority. The discussion of the report and resolutions occupied the House several days, and whatever effort

CHARLES SUMNER.

power in the premises, except to report the occurrence to the House. In the House the usual committee from the three parties was raised, resulting in two reports. The minority, sustained by the vote of sixty members, pleaded a want of jurisdiction. The majority recommended the expulsion of Brooks, and expressed disapprobation by the House of the course of his colleague Edmundson in coun-

members made to disguise their motives, their actions, either of condemnation or of excuse, arose in the main clearly enough from their party relations. Under the forms of parliamentary debate, the South and the North were breathing mutual recrimination and defiance.

The public of both sections took up the affair with equal party zeal. From the North

PRESTON S. BROOKS.

came resolutions of legislatures, outbursts of indignation in meetings and addresses, and the denunciation of Brooks and his deed in the newspapers. In the South the exactly opposite sentiment predominated. Brooks was defended and eulogized, and presented with canes and pitchers as testimonials to his valor. When the resolution of censure had been passed, he at once resigned his seat in the House, and, going home to his constituents, was immediately reelected. Within three weeks he reappeared at the bar of the House, with a new commission from his governor, and was sworn in and continued his service as before. The somewhat arrogant address which preceded his resignation contained the remarkable intimation that much more serious results might have grown out of the incident. "No act of mine," he said, "on my personal account shall inaugurate revolution; but when you, Mr. Speaker, return to your own home, and hear the people of the

of Massachusetts, which was stricken down by the blow. I denounce it in the name of humanity. I denounce it in the name of civilization, which it outraged. I denounce it in the name of that fair play which bullies and prize-fighters respect." For this, after some efforts had been made by mutual friends to patch up an amicable understanding, Brooks sent him also a challenge. Mr. Burlingame accepted the challenge, and his second designated Clifton House in Canada as the rendezvous and rifles as weapons. Burlingame at once started on the journey; but Brooks declined to go, on the excuse that his life would not be safe on such a trip through the North.

Broadened into national significance by all these attendant circumstances, the Sumner assault became a leading event in the great slavery contest which was being fought out between the South and the North. It might well rank as one of the episodes of the civil

great North — and they are a great people — speak of me as a bad man, you will do me the justice to say that a blow struck by me at this time would be followed by a revolution, and this I know."

Under the state of public sentiment then prevailing at the South, it would have been strange if the extraordinary event and the following debate had not provoked other similar affairs. Mr. Sumner's colleague, Senator Wilson of Massachusetts, in his speech characterized the assault as "brutal, murderous, and cowardly." For this language Brooks sent him a challenge. Wilson wrote a reply declining the encounter, but in the same letter announcing that "I religiously believe in the right of self-defense, in its broadest sense."

One of the sharpest denunciations of the assault was made by Burlingame, a Massachusetts Representative. "I denounce it," he said, "in the name of the Constitution it violates. I denounce it in the name of the sovereignty

war then raging in Kansas, out of which it had in reality grown, and with which it was intertwined in motive, act, and comment. In result the incident was extremely damaging to the South, for it tended, much more than any single Border Ruffian crime in Kansas, to unite hesitating and wavering opinion in the North against the alarming flood of lawlessness and violence, which as a rule found its origin and its defense in the ranks of the pro-slavery party. Certainly no phase of the transaction was received by the North with such popular favor as some of the bolder avowals by Northern Representatives of their readiness to fight, and especially by Burlingame's actual acceptance of the challenge of Brooks.

Readers of a later generation will naturally wish to know what further befell Senator Sumner. The shock of the attack, and the serious wounds he received, produced a spinal malady, from which he rallied with great difficulty, and only after severe medical treatment and years of enforced abstinence from work. As the constituents of Brooks sent him back to the House, so also the legislature of Massachusetts, in January, 1857, with but a few dissenting votes, reelected Sumner to a new sen-

ANSON BURLINGAME. (FROM A PHOTOGRAPH BY WILLIAM SHAW.)

atorial term, beginning the 4th of March. He came to Washington and was sworn in, but within a few days sailed for Europe, and during the greater part of the long interim between that time and the succeeding presidential campaign his seat in the Senate stood vacant.

It was on the 4th of June, 1860, that he again raised his voice in debate. Some changes had occurred; both Butler and Brooks were dead;* the Senate was assembled in its new hall in the north wing of the Capitol extension. But in the main the personnel and the spirit of the pro-slavery party still confronted him. "Time has passed," he said, "but the question remains." A little more than four years before, he had essayed to describe "The Crime against Kansas"; now, in an address free from offensive personalities but more unsparing in rhetoric and stronger in historical arraignment, he delineated what he named the "Barbarism of Slavery." Picturing to ourselves the orator, the circumstances, and the theme, we can comprehend the exaltation with which he exclaimed in his exordium:

"Slavery must be resisted not only on political grounds, but on all other grounds, whether social, economical, or moral. Ours is no holiday contest; nor is it any strife of rival factions — of White and Red Roses; of theatric Neri and Bianchi; but it is a solemn battle between Right and Wrong, between Good and Evil. . . . Grandeur debate has not occurred in our history, rarely in any history; nor can this debate close or subside except with the triumph of Freedom."

* P. S. Brooks died January 27th, 1857; A. P. Butler died May 25th, 1857.

HENRY WILSON (FROM A PHOTOGRAPH BY HOYT)

With this speech Sumner resumes his place as a conspicuous figure and an indefatigable energy in national politics and legislation, tireless in attacking and pursuing slavery until its final overthrow.

THE DRED SCOTT DECISION.

DEEP and widespread as hitherto had been the slavery agitation created by the repeal of the Missouri Compromise and by the consequent civil war in Kansas, an event entirely unexpected to the public at large now suddenly doubled its intensity. This was the an-

suit they now claimed freedom, because during the time of residence with their master at these military posts slavery was there prohibited by positive law; namely, at Rock Island by the ordinance of 1787, and later by the Constitution of Illinois; at Fort Snelling by the Missouri Compromise act of 1820, and sundry other acts of Congress relating to Wisconsin Territory.

The local court at St. Louis before which this action was brought appears to have made short work of the case. It had become settled legal doctrine by Lord Mansfield's decision in the *Somerset* case, rendered four years before

DRED SCOTT.

HARRIET, WIFE OF DRED SCOTT.

nouncement, two days after Buchanan's inauguration, of the decision of the Supreme Court of the United States in the *Dred Scott* case. This celebrated case had arisen as follows:

Two or three years before the Nebraska Bill was thought of, a suit was begun by a negro named Dred Scott, in a local court at St. Louis, Missouri, to recover his and his family's freedom from slavery. He alleged that his master, one Dr. Emerson, an army surgeon, living in Missouri, had taken him as his slave to the military post at Rock Island in the State of Illinois, and afterwards to Fort Snelling, situated in what was originally Upper Louisiana, but was at that time part of Wisconsin Territory, and now forms part of the State of Minnesota. While at this latter post Dred Scott, with his master's consent, married a colored woman, also brought as a slave from Missouri, and of this marriage two children were born. All this happened between the years 1834 and 1838. Afterwards Dr. Emerson brought Dred Scott and his family back to Missouri. In this

our Declaration of Independence, that "the state of slavery is of such a nature that it is incapable of being introduced on any reasons, moral or political, but only positive law. . . . It is so odious that nothing can be suffered to support it but positive law." The learned chief-justice therefore ordered that *Somerset*, being claimed as a Virginia slave brought by his master into England, and attempted to be carried away against his will, should be discharged from custody or restraint, because there was no positive law in England to support slavery. The doctrine was subsequently modified by another English chief-justice, Lord Stowell, in 1827, to the effect that absence of positive law to support slavery in England only operates to suspend the master's authority, which is revived if the slave voluntarily returns into an English colony where slavery does exist by positive law.

The States of the Union naturally inherited and retained the common law of England, and the principles and maxims of English jurispru-

ROGER B. TANEY, CHIEF-JUSTICE U. S. SUPREME COURT.

dence not necessarily abrogated by the change of government, and among others this doctrine of Lord Mansfield. Unlike England, however, where there was no slavery and no law for or against it, some of the American States had positive laws establishing slavery, others positive laws prohibiting it. Lord Mansfield's doctrine, therefore, enlarged and strengthened by American statutes and decisions, had come to be substantially this: Slavery, being contrary to natural right, exists only by virtue of local law; if the master takes his slave for permanent residence into a jurisdiction where slavery is prohibited, the slave thereby acquires a right to his freedom everywhere. On the other hand, Lord Stowell's doctrine was similarly enlarged and strengthened so as to allow the master right of transit and temporary sojourn in free States and territories without suspension or forfeiture of his authority over his slave. Under the somewhat complex American system of

government, in which the Federal Union and the several States each claim sovereignty and independent action within certain limitations, it became the theory and practice that toward each other the several States occupied the attitude of foreign nations, which relation was governed by international law, and that the principle of comity alone controlled the recognition and enforcement by any State of the law of any other State. Under this theory, the courts of slave States had generally accorded freedom to slaves, even when acquired by the laws of a free State, and reciprocally the courts of free States had enforced the master's right to his slave where that right depended on the laws of a slave State. In this spirit, and conforming to this established usage, the local court of Missouri declared Dred Scott and his family free.

The claimant, loath to lose these four human "chattels," carried the case to the Supreme Court of the State of Missouri, where at its

JOHN MCLEAN, ASSOCIATE JUSTICE U. S. SUPREME COURT.

March term, 1852, it was reversed, and a decree rendered that these negroes were not entitled to freedom. Three judges formed the court, and two of them joined in an opinion bearing internal evidence that it was prompted, not by considerations of law and justice, but by a spirit of retaliation growing out of the ineradicable antagonism of freedom and slavery.

"Every State," says the opinion, "has the right of determining how far, in a spirit of comity, it will respect the laws of other States. Those laws have no intrinsic right to be enforced beyond the limits of the State for which they were enacted. The respect allowed them will depend altogether on their conformity to the policy of our institutions. No State is bound to carry into effect enactments conceived in a spirit hostile to that which pervades her own laws. . . . It is a humiliating spectacle to see the courts of a State confiscating the property of her own citizens by the command of a foreign law. . . . Times now are not as they were when the former decisions on this subject were made. Since then not only individuals but States have been possessed with a dark and fell spirit in relation to slavery, whose gratification is sought in the pursuit of

measures whose inevitable consequence must be the overthrow and destruction of our Government. Under such circumstances it does not behoove the State of Missouri to show the least countenance to any measure which might gratify this spirit. She is willing to assume her full responsibility for the existence of slavery within her limits, nor does she seek to share or divide it with others."*

To this partisan bravado the third judge replied with a dignified rebuke:

"As citizens of a slave-holding State," said he in his dissenting opinion, "we have no right to complain of our neighbors of Illinois, because they introduce into their State Constitution a prohibition of slavery; nor has any citizen of Missouri who removes with his slave to Illinois a right to complain that the fundamental law of the State to which he removes, and in which he makes his residence, dissolves the relation between him and his slave. It is as much his own voluntary act as if he had executed a deed of emancipation. . . . There is with me nothing in the law relating to slavery which distinguishes it from the law on any other subject, or allows any more accommodation to the temporary public excitements which are gath-

* Scott, J., 15 Mo. R., pp. 582-6.

SAMUEL NELSON, ASSOCIATE JUSTICE U. S. SUPREME COURT.

ered around it. . . . In this State it has been recognized from the beginning of the government, as a correct position in law, that a master who takes his slave to reside in a State or territory where slavery is prohibited thereby emancipates his slave. [Citing cases.] . . .

"But the Supreme Court of Missouri, so far from standing alone on this question, is supported by the decisions of other slave States, including those in which it may be supposed there was the least disposition to favor emancipation. [Citing cases.] . . . Times may have changed, public feeling may have changed, but principles have not and do not change; and in my judgment there can be no safe basis for judicial decision but in those principles which are immutable." *

These utterances, it must be remembered, occurred in the year 1852, when all slavery agitation was supposed to have been forever settled. They show conclusively that the calm was superficial and delusive, and that this

deep-reaching contest was still, as before the adjustment of 1850, actually transforming the various institutions of society. Gradually, and as yet unnoticed by the public, the motives disclosed in these opinions were beginning to control courts of justice, and popular discussion and excitement were not only shaping legislation, but changing the tenor of legal decisions throughout the country.

Not long after the judgment by the Supreme Court of Missouri, Dred Scott and his family were sold to a man named Sandford, who was a citizen of New York. This circumstance afforded a ground for bringing a similar action in a Federal tribunal, and accordingly Dred Scott once more sued for freedom, in the United States Circuit Court at St. Louis.†

Missouri on the second day of November, 1853. The trespass complained of is alleged to have occurred on the first day of January, 1853. [Records Supreme Court United States.]

* Gamble, J. 15 Mo. R., pp. 589-92.

† The declaration in the case of Dred Scott vs. John F. A. Sandford was filed in the clerk's office of the Circuit Court of the United States for the district of

BENJAMIN R. CURTIS, ASSOCIATE JUSTICE U. S. SUPREME COURT.

The case was tried in May, 1854, and a decree rendered that they "were negro slaves, the lawful property" of Sandford. As a final effort to obtain justice, they appealed by writ of error to the Supreme Court of the United States, the highest judicial tribunal of the nation.

Before this court of last resort the case was argued a first time in the spring of 1856. The country had been for two years in a blaze of political excitement. Civil war was raging in Kansas; Congress was in a turmoil of partisan discussion; a presidential election was impending, and the whole people were anxiously noting the varying phases of party politics. But few persons knew there was such a thing as the Dred Scott case on the docket of the

* At the first hearing Mr. Montgomery Blair argued the case for Dred Scott, and Senator Geyer of Missouri and ex-Attorney-General Reverdy Johnson of Maryland for the claimant. At the second hearing Mr. Blair and Mr. George T. Curtis of Boston argued the case on behalf of Dred Scott, and Mr. Geyer and Mr. Johnson again made the argument for the claimant. All of them performed the service without compensation.

† "The court will not decide the question of the

Supreme Court; but those few appreciated the importance of the points it involved, and several distinguished lawyers volunteered to take part in the argument.* Two questions were presented to the court: First, Is Dred Scott a citizen entitled to sue? Secondly, did his residence at Rock Island and at Fort Snelling, under the various prohibitions of slavery existing there, work his freedom?

The Supreme Court was composed of nine justices, namely, Chief-Justice Taney and Associate Justices McLean, Wayne, Catron, Daniel, Nelson, Grier, Curtis, and Campbell. There was at once manifested among the judges not only a lively interest in the questions presented, but a wide difference of views as to the manner of treating them. Consultations of the Supreme Court are always shrouded in inviolable secrecy, but the opinions afterwards published indicate that the political aspects of slavery which were then convulsing the country from the very first found a certain sympathy and reflection in these grave judicial delibera-

tions. The discussions yet turned upon certain merely technical rules to be applied to the pleadings under review; and ostensibly to give time for further examination, the case was postponed and a re-argument ordered for the next term. It may, however, be suspected that the nearness of the presidential election had more to do with this postponement than did the exigencies of the law.†

The presidential election came, and Mr. Buchanan was chosen. Soon after, the court again met to begin its long winter term; and about the middle of December, 1856, the Dred Scott case was once more elaborately argued. Again occupying the attention of the court for four successive days, as had also been done in the first hearing, the eminent counsel, after

Missouri Compromise line,—a majority of the judges being of opinion that it is not necessary to do so. (This is confidential.) The one engrossing subject in both houses of Congress and with all the members is the presidency; and upon this everything done and omitted, except the most ordinary necessities of the country, depends." [Judge Curtis to Mr. Ticknor, April 8th, 1856. Curtis, "Life of B. R. Curtis," Vol. I., p. 180.]

passing lightly over mere technical subtleties, discussed very fully what was acknowledged to be the leading point in the controversy; namely, whether Congress had power under the Constitution to prohibit slavery in the Federal territories, as it had done by the Missouri Compromise act and various other laws. It was precisely the policy, or impolicy, of this and similar prohibitions which formed the bone of contention in party politics. The question of their constitutional validity was certain to take even a higher rank in public interest.

When after the second argument the judges took up the case in conference for decision the majority held that the judgment of the Missouri Federal tribunal should simply be affirmed on its merits. In conformity to this view, Mr. Justice Nelson was instructed to prepare an opinion to be read as the judgment of the Supreme Court of the United States. Such a paper was thereupon duly written by him, of the following import: It was a question, he thought, whether a temporary residence in a free State or territory could work the emancipation of a slave. It was the exclusive province of each State, by its legislature or courts of justice, to determine this question for itself. This determined, the Federal courts are bound to follow the State's decision. The Supreme Court of Missouri had decided Dred Scott to be a slave. In two cases tried since, the same judgment had been given. Though former decisions had been otherwise, this must now be admitted as "the settled law of the State," which, he said, "is conclusive of the case in this court."

This very narrow treatment of the points at issue, having to do with the mere lifeless machinery of the law, was strikingly criticised in the dissenting opinion afterwards read by Mr. Justice McLean, whose reply, by way of anticipation, may properly be quoted here. He denied that it was exclusively a Missouri question.

"It involves a right claimed under an act of Congress and the Constitution of Illinois, and which cannot be decided without the consideration and construction of those laws. . . .

"Rights sanctioned for twenty-eight years ought not and cannot be repudiated, with any semblance of justice, by one or two decisions, influenced, as declared, by a determination to counteract the excitement against slavery in the free States. . . . Having the same rights of sovereignty as the State of Missouri in adopting a constitution, I can perceive no reason why the institutions of Illinois should not receive the same consideration as those of Missouri. . . . The Missouri Court disregards the express provisions of an act of Congress and the Constitution of a sovereign State, both of which laws for twenty-eight years it had not only regarded, but carried into effect. If a State court may do this, on a question involving the liberty of a human being, what protection do the laws afford?"

Had the majority of the judges carried out their original intention, and announced their

decision in the form in which Mr. Justice Nelson under their instruction wrote it,* the case of Dred Scott would, after a passing notice, have gone to a quiet sleep under the dust of the law libraries. A far different fate was in store for it. The nation was then being stirred to its very foundation by the slavery agitation. The party of pro-slavery reaction was for the moment in the ascendant; and as by an irresistible impulse, the Supreme Court of the United States was now swept from its hitherto impartial judicial moorings into the dangerous seas of politics.

Before Judge Nelson's opinion was submitted to the judges in conference for final adoption as the judgment of the court, a movement seems to have taken place among the members, not only to change the ground of the decision, but also to greatly enlarge the field of inquiry. It is stated by one of the participants in that memorable transaction (Mr. Justice Campbell) that this occurred:

"Upon a motion of Mr. Justice Wayne, who stated that the case had created public interest and expectation, that it had been twice argued, and that an impression existed that the questions argued would be considered in the opinion of the court."†

He further says that

"The apprehension had been expressed by others of the court, that the court would not fulfill public expectation or discharge its duties by maintaining silence upon these questions; and my impression is, that several opinions had already been begun among the members of the court, in which a full discussion of the case was made, before Justice Wayne made this proposal."‡

The exact time when this movement was begun cannot now be ascertained. The motives which prompted it can be inferred by recalling contemporaneous political events. A great controversy divided public opinion whether slavery might be extended or should be restricted. The Missouri Compromise had been repealed to make such an extension possible. The terms of that repeal were purposely couched in ambiguous language. Kansas and Nebraska were left "perfectly free to form and regulate their domestic institutions in their own way, subject only to the Constitution of the United States." Whether under the Constitution slavery could be excluded from the Federal territories was affirmed by Northern and denied by Southern Democrats. Northern and Southern Democrats, acting together in the Cincinnati National Convention, had ingeniously avoided any solution of this difference.

A twofold interpretation had enabled that party to elect Mr. Buchanan, not by its own

* Campbell to Tyler, "Life of Taney," pp. 383-4.

† Ibid. p. 384.

‡ Ibid. p. 384.

popular strength, but by the division of its opponents. Notwithstanding its momentary success, unless it could develop new sources of strength the party had only a precarious hold upon power. Its majority in the Senate was waning. In Kansas free-State emigration was outstripping the South in numbers and checkmating her in border strife. According to present relative growth in sectional representation and sectional sentiment, the balance of power was slowly but steadily passing to the North.

Out of this doubt and difficulty there was one pathway that seemed easy and certain. All the individual utterances from the Democratic party agreed that the meaning of the words "subject to the Constitution" was a question for the courts. This was the original compact between Northern and Southern Democrats in caucus when Douglas consented to repeal. Douglas, shorn of his prestige by his defeat for presidential nomination, must accept conditions from his successful rival. The Dred Scott case afforded the occasion for a decision. Of the nine judges on the Supreme Bench seven were Democrats, and of these five were appointed from slave States. A better opportunity for the South to obtain a favorable dictum could never be expected to arise. A declaration by the Supreme Court of the United States that under the Constitution Congress possessed no power to prohibit slavery in the Federal territories would by a single breath end the old and begin a new political era. Congress was in session and the political leaders were assembled at Washington. Political topics excluded all other conversation or thought. Politics reddened the plains of Kansas; politics had recently desecrated the Senate chamber with a murderous personal assault; politics contended greedily for the spoils of a new administration; politics nursed a tacit conspiracy to nationalize slavery. The slavery sentiment ruled society, ruled the Senate, ruled the Executive Mansion. It is not surprising that this universal influence flowed in at the open door of the national hall of justice,—that it filtered through the very walls which surrounded the consulting-room of the Supreme Court.

The judges were, after all, but men. They dined, they talked, they exchanged daily per-

* A striking example may be found in the utterance of Attorney-General Cushing of the retiring Pierce administration, in a little parting address to the Supreme Court, March 4th, 1857:

"Yours is not the gauntleted hand of the soldier, nor yours the voice which commands armies, rules cabinets, or leads senates; but though you are none of these, yet you are backed by all of them. Theirs is the external power which sustains your moral authority; you are the incarnate mind of the political body of the nation. In the complex institutions of our country

sonal and social courtesies with the political world. Curiosity, friendship, patriotism, led them to the floors of Congress to listen to the great debates. Official ceremony called them into the presence of the President, of legislators, of diplomats. They were feasted, flattered, questioned, reminded of their great opportunity, tempted with the suggestion of their supreme authority.* They could render their names illustrious. They could honor their States. They could do justice to the South. They could perpetuate their party. They could settle the slavery question. They could end sectional hatred, extinguish civil war, preserve the Union, save their country. Advanced age, physical feebleness, party bias, the political ardor of the youngest and the political satiety of the eldest, all conspired to draw them under the insidious influence of such considerations. One of the judges in official language frankly avows the motive and object of the majority of the court. "The case," he wrote, "involves private rights of value, and constitutional principles of the highest importance, about which there had become such a difference of opinion that the peace and harmony of the country required the settlement of them by judicial decision."† This language betrays the confusion of ideas and misconception of authority which tempted the judges beyond their proper duty. Required only to decide a question of private rights, they thrust themselves forward to sit as umpires in a quarrel of parties and factions.

In an evil hour they yielded to the demands of "public interest," and resolved to "fulfill public expectation." Mr. Justice Wayne "proposed that the Chief-Justice should write an opinion on all of the questions as the opinion of the court. This was assented to, some reserving to themselves to qualify their assent as the opinion might require. Others of the court proposed to have no question, save one, discussed."‡ The extraordinary proceeding was calculated to touch the pride of Mr. Justice Nelson. He appears to have given it a kind of sullen acquiescence. "I was not present," he writes, "when the majority decided to change the ground of the decision, and assigned the preparation of the opinion to the Chief-Justice; and when advised of the change I simply gave notice that I should read the

you are the pivot point upon which the rights and liberties of all, government and people alike, turn; or, rather, you are the central light of constitutional wisdom around which they perpetually revolve. Long may this court retain the confidence of our country as the great conservators, not of the private peace only, but of the sanctity and integrity of the Constitution."—[Nat. Int., March 5th, 1857.]

opinion I had prepared as my own, and which is the one on file." * From this time the pens of the other judges were busy, and in the inner political circles of Washington the case of Dred Scott gradually became a shadowy and portentous *case à faire*.

The first intimation which the public at large had of the coming new dictum was given in Mr. Buchanan's inaugural. The fact that he did not contemplate such an announcement until after his arrival in Washington † leads to the inference that it was prompted from high quarters. In congressional and popular discussions the question of the moment was at what period in the growth of a territory its voters might exclude or establish slavery. Referring to this Mr. Buchanan said: "It is a judicial question, which legitimately belongs to the Supreme Court of the United States, before whom it is now pending, and will, it is understood, be speedily and finally settled. To their decision, in common with all good citizens, I shall cheerfully submit, whatever this may be."

The popular acquiescence being thus invoked by the presidential voice and example, the court announced its decision two days afterwards.—March 6th, 1857. The essential character of the transaction impressed itself upon the very form of the judgment, if indeed it may be called at all by that name. Chief-Justice Taney read the opinion of the court. Justices Nelson, Wayne, Daniel, Grier, Catron, and Campbell each read a separate and individual opinion, agreeing with the Chief-Justice on some points, and omitting or disagreeing on others, or arriving at the same result by different reasoning, and in the same manner differing from one another. The two remaining associate justices, McLean and Curtis, read emphatic dissenting opinions. Thus the collective utterance of the bench resembled the speeches of a town meeting rather than the decision of a court, and employed two hundred and forty printed pages of learned legal disquisition to order the simple dismissal of a suit. Compared with the prodigious effort the result is a ridiculous anti-climax, revealing the motive and animus of the whole affair. The opinion read by Chief-Justice Taney was long and elaborate, and the following were among its leading conclusions :

* Nelson to Tyler, "Life of Taney," p. 385.

† "Mr. Buchanan was also preparing his inaugural address with his usual care and painstaking, and I copied his drafts and recopied them until he had prepared it to his satisfaction. It underwent no alteration after he went to the National Hotel in Washington, except that he there inserted a clause in regard to the question then pending in the Supreme Court, as one that would dispose of a vexed and dangerous topic by the highest judicial authority of the land."—[Statement of James Buchanan Henry (President Buchanan's private

That the Declaration of Independence and the Constitution of the United States do not include or refer to negroes otherwise than as property; that they cannot become citizens of the United States nor sue in the Federal courts. That Dred Scott's claim to freedom by reason of his residence in Illinois was a Missouri question, which Missouri law had decided against him. That the Constitution of the United States recognizes slaves as property, and pledges the Federal government to protect it; and that the Missouri Compromise act and like prohibitory laws are unconstitutional. That the Circuit Court of the United States had no jurisdiction in the case and could give no judgment in it, and must be directed to dismiss the suit.

This remarkable decision challenged the attention of the whole people to a degree never before excited by any act of their courts of law. Multiplied editions were at once printed, ‡ scattered broadcast over the land, read with the greatest avidity, and earnestly criticised.

The public sentiment regarding it immediately divided, generally on existing party lines—the South and the Democrats accepting and commending, the North and the Republicans spurning and condemning it. The great anti-slavery public was not slow in making a practical application of its dogmas: that a sweeping and revolutionary exposition of the Constitution had been attempted when confessedly the case and question had no right to be in court; that an evident partisan dictum of national judges had been built on an avowed partisan decision of State judges; that both the legislative and judicial authority of the nation had been trifled with; that the settler's "sovereignty" in Kansas consisted only of a Southern planter's right to bring his slaves there; and that if under the "property" theory the Constitution carries slavery to the territories, it would by the same inevitable logic carry it into free States.

But much more offensive to the Northern mind than his conclusions of law were the language and historical assertions by which Chief-Justice Taney strove to justify them.

"In the opinion of the court," said he, "the legislation and histories of the times, and the language used in the Declaration of Independence, show, that neither

vate secretary) in Curtis's "Life of Buchanan," Vol. II., p. 187.]

‡ "It may not be improper for me here to add that so great an interest did I take in that decision, and in its principles being sustained and understood in the commonwealth of Kentucky, that I took the trouble at my own cost to print or have printed a large edition of that decision to scatter it over the State; and unless the mails have miscarried, there is scarcely a member elected to the Legislature who has not received a copy with my frank."—[Vice-President Breckinridge, Frankfort speech, December, 1859.]

the class of persons who had been imported as slaves, nor their descendants, whether they had become free or not, were then acknowledged as a part of the people, nor intended to be included in the general words used in that memorable instrument. It is difficult at this day to realize the state of public opinion in relation to that unfortunate race which prevailed in the civilized and enlightened portions of the world at the time of the Declaration of Independence and when the Constitution of the United States was framed and adopted. But the public history of every European nation displays it in a manner too plain to be mistaken. They had for more than a century before been regarded as beings of an inferior order, and altogether unfit to associate with the white race, either in social or political relations; and so far inferior, that they had no rights which the white man was bound to respect; and that the negro might justly and lawfully be reduced to slavery for his benefit. He was bought and sold, and treated as an ordinary article of merchandise and traffic, whenever a profit could be made by it."

Quoting the provisions of several early slave codes, he continues:

"They show that a perpetual and impassable barrier was intended to be erected between the white race and the one which they had reduced to slavery and governed as subjects with absolute and despotic power, and which they then looked upon as so far below them in the scale of created beings that intermarriages between white persons and negroes or mulattoes were regarded as unnatural and immoral, and punished as crimes, not only in the parties, but in the person who joined them in marriage. And no distinction in this respect was made between the free negro or mulatto and the slave, but this stigma, of the deepest degradation, was fixed upon the whole race."

Referring to the Declaration, which asserts that all men are created equal, he remarks:

"The general words above quoted would seem to embrace the whole human family, and if they were used in a similar instrument at this day would be so understood. But it is too clear for dispute, that the enslaved African race were not intended to be included, and formed no part of the people who framed and adopted this declaration; for if the language, as understood in that day, would embrace them, the conduct of the distinguished men who framed the Declaration of Independence would have been utterly and flagrantly inconsistent with the principles they asserted, and instead of the sympathy of mankind, to which they so confidently appealed, they would have deserved and received universal rebuke and reprobation."

He then applies the facts thus assumed, as follows:

"The only two provisions which point to them and include them treat them as property, and make it the duty of the Government to protect it; no other power in relation to this race is to be found in the Constitution. . . . No one, we presume, supposes that any change in public opinion or feeling in relation to this unfortunate race, in the civilized nations of Europe or in this country, should induce the court to give to the words of the Constitution a more liberal construction in their favor than they were intended to bear when the instrument was framed and adopted. . . . It is not only the same in words, but the same in meaning, and delegates the same powers to the Government, and reserves and secures the same rights and privileges to the citizen; and as long as it continues to exist in its present form, it speaks not only in the same words but with the same meaning and intent with which it

spoke when it came from the hands of its framers and was voted on and adopted by the people of the United States."

This cold and pitiless historical delineation of the bondage, ignorance, and degradation of the unfortunate kidnapped Africans and their descendants in a by-gone century, as an immutable basis of constitutional interpretation, was met by loud and indignant protest from the North. The people and press of that section seized upon the salient phrase of the statement, and applying it in the present tense, accused the Chief-Justice with saying that "a negro has no rights which a white man is bound to respect." This was certainly a distortion of his exact words and meaning; yet the exaggeration was more than half excusable, in view of the literal and unbending rigor with which he proclaimed the constitutional disability of the entire African race in the United States, and denied their birthright in the Declaration of Independence. His unmerciful logic made the black before the law less than a slave; it reduced him to the status of a horse or dog, a bale of dry-goods or a block of stone. Against such a debasement of any living image of the Divine Maker the resentment of the public conscience of the North was quick and unsparing.

Had Chief-Justice Taney's delineation been historically correct, it would have been nevertheless unwise and unchristian to embody it in the form of a disqualifying legal sentence and an indelible political brand. But its manifest untruth was clearly shown by Mr. Justice Curtis in his dissenting opinion. He reminded the Chief-Justice that at the adoption of the Constitution:

"In five of the thirteen original States colored persons then possessed the elective franchise, and were among those by whom the Constitution was ordained and established. If so, it is not true in point of fact that the Constitution was made exclusively by the white race, and that it was made exclusively for the white race is in my opinion not only an assumption not warranted by anything in the Constitution, but contradicted by its opening declaration that it was ordained and established by the people of the United States for themselves and their posterity; and as free colored persons were then citizens of at least five States, and so in every sense part of the people of the United States, they were among those for whom and whose posterity the Constitution was ordained and established."

Elsewhere in the same opinion he says:

"I shall not enter into an examination of the existing opinions of that period respecting the African race, nor into any discussion concerning the meaning of those who asserted in the Declaration of Independence that all men are created equal; that they are endowed by their Creator with certain inalienable rights; that among these are life, liberty, and the pursuit of happiness. My own opinion is, that a calm comparison of these assertions of universal abstract truths, and of their own individual opinions and acts, would

not leave these men under any reproach of inconsistency; that the great truths they asserted on that solemn occasion they were ready and anxious to make eternal, who ever a necessary regard to circumstances, which no statesman can disregard without producing more evil than good, would allow; and that it would not be just to them, nor true in itself, to allege that they intended to say that the Creator of all men had endowed the white race exclusively with the great natural rights which the Declaration of Independence asserts."

Mr. Justice McLean, in his dissenting opinion, completes the outline of the true historical picture in accurate language:

"I prefer the lights of Madison, Hamilton, and Jay, as a means of construing the Constitution in all its bearings, rather than to look behind that period into a truth which is now declared to be piracy, and punished with death by Christian nations. I do not mean to draw the sources of our domestic relations from so dark a ground. Our independence was a great epoch in the history of freedom; and while I admit the Government was not made especially for the colored race, yet many of them were citizens of the New England States, and exercised the rights of suffrage when the Constitution was adopted, and it was not doubted by any intelligent person that its tendencies would greatly ameliorate their condition."

"Many of the States on the adoption of the Constitution, or shortly afterward, took measures to abolish slavery within their respective jurisdictions; and it is a well-known fact that a belief was cherished by the leading men, South as well as North, that the institution of slavery would gradually decline until it would become extinct. The increased value of slave labor, in the culture of cotton and sugar, prevented the realization of this expectation. Like all other communities and States, the South were influenced by what they considered to be their own interests. But if we are to turn our attention to the dark ages of the world, why confine our view to colored slavery? On the same principles white men were made slaves. All slavery has its origin in power and is against right."

To the constitutional theory advanced by the Chief-Justice, that Congress cannot exercise sovereign powers over Federal territories, and hence cannot exclude slave property from them, Justices McLean and Curtis also opposed a vigorous and exhaustive argument, which the most eminent lawyers and statesmen of that day deemed conclusive. The historical precedents alone ought to have determined the issue.

"The judicial mind of this country, State and Federal," says McLean, "has agreed on no subject within its legitimate action with equal unanimity as on the power of Congress to establish territorial governments. No court, State or Federal, no judge or statesman, is known to have had any doubts on this question for nearly sixty years after the power was exercised."

And Curtis adds:

"Here are eight distinct instances, beginning with the first Congress, and coming down to the year 1848, in

* The ownership of Dred Scott and his family passed by inheritance to the family of a Massachusetts Republican member of Congress. The following telegram, copied from the "Providence Post" into the "Washington Union," shows the action of the new owner:

which Congress has excluded slavery from the territory of the United States; and six distinct instances in which Congress organized governments of territories by which slavery was recognized and continued, beginning also with the first Congress, and coming down to the year 1822. These acts were severally signed by seven Presidents of the United States, beginning with General Washington, and coming regularly down as far as Mr. John Quincy Adams, thus including all who were in public life when the Constitution was adopted. If the practical construction of the Constitution, contemporaneously with its going into effect, by men intimately acquainted with its history from their personal participation in framing and adopting it, and continued by them through a long series of acts of the gravest importance, be entitled to weight in the judicial mind on a question of construction, it would seem to be difficult to resist the force of the acts above adverted to."

DOUGLAS AND LINCOLN ON DRED SCOTT.

MANIFESTLY, when the trained and informed intellects of the learned judges differed so radically concerning the principles of law and the facts of history applicable to the Dred Scott question, the public at large could hardly be expected to receive the new dogmas without similar divergence of opinion. So far from exercising a healing influence, the decision widened immensely the already serious breach between the North and the South. The persons immediately involved in the litigation were quickly lost sight of;* but the constitutional principle affirmed by the court was defended by the South and denounced by the North with zeal and acrimony. The Republican party did not further question or propose to disturb the final judgment in the case; but it declared that the Dred Scott doctrines of the Supreme Court should not be made a rule of political action, and precisely this the South, together with the bulk of the Northern Democrats, insisted should be done.

A single phase of the controversy will serve to illustrate the general drift of the discussion throughout the Union. Some three months after the delivery of the opinion of the court, Senator Douglas found himself again among his constituents in Illinois, and although there was no political campaign in progress, current events and the roused state of public feeling seemed to require that he should define his views in a public speech. It marks his acuteness as a politician that he already realized what a fatal stab the Dred Scott decision had given his vaunted principle of "Popular Sovereignty," with which he justified his famous repeal of the Missouri Compromise. He had ever since argued that congressional prohibition of slavery was obsolete and useless, and

"ST. LOUIS, May 26 [1857]. Dred Scott with his wife and two daughters were emancipated to-day by Taylor Blow, Esq. They had been conveyed to him by Mr. Chaffee for that purpose."

that the choice of slavery or freedom ought to be confided to the local territorial laws, just as it was confided to local State constitutions. But the Dred Scott decision announced that slaves were property which Congress could not exclude from the territories, adding also the inevitable conclusion that what Congress could not do a territorial legislature could not.*

Difficult as this made his task of reconciling his pet hobby with the Dred Scott decision, such was his political boldness, and such had been his skill and success in sophistry, that he undertook even this hopeless effort. Douglas therefore made a speech at Springfield, Illinois, on the 12th of June, 1857, in which he broadly and fully indorsed and commended the opinion of Chief-Justice Taney and his concurring associates, declaring that

"Their judicial decisions will stand in all future time, a proud monument to their greatness, the admiration of the good and wise, and a rebuke to the partisans of faction and lawless violence. If unfortunately any considerable portion of the people of the United States shall so far forget their obligations to society as to allow the partisan leaders to array them in violent resistance to the final decision of the highest judicial tribunal on earth, it will become the duty of all the friends of order and constitutional government, without reference to past political differences, to organize themselves and marshal their forces under the glorious banner of the Union, in vindication of the Constitution and supremacy of the laws over the advocates of faction and the champions of violence."

Proceeding then with a statement of the case, he continued:

"The material and controlling points in the case, those which have been made the subject of unmeasured abuse and denunciation, may be thus stated: 1st. The court decided that under the Constitution of the United States, a negro descended from slave parents is not and can not be a citizen of the United States. 2d. That the act of March 6th, 1820, commonly called the Missouri Compromise act, was unconstitutional and void before it was repealed by the Nebraska act, and consequently did not and could not have the legal effect of extinguishing a master's right to his slave in that territory. While the right continues in full force under the guarantees of the Constitution, and cannot be divested or alienated by an act of Congress, it necessarily remains a barren and a worthless right, unless sustained, protected, and enforced by appropriate police regulations and local legislation, prescribing adequate remedies for its violation. These regulations and remedies must necessarily depend entirely upon the will and wishes of the people of the territory, as they can only be prescribed by the local legislatures. Hence the great principle of popular sovereignty and self-government is sustained and firmly established by the authority of this decision."

It is scarcely possible that Douglas convinced himself by such a glaring *non sequitur*; but he had no other alternative. It was a desperate expedient to shield himself as well as he might from the damaging recoil of his own

temporizing statesmanship. The declaration made thus early is worthy of historical notice as being the substance and groundwork of the speaker's somewhat famous "Freeport doctrine," or theory of "unfriendly legislation," to which Lincoln's searching interrogatories drove him in the great Lincoln-Douglas debates of the following year. Repeated and amplified at that time, it became in the eyes of the South the unpardonable political heresy which lost him the presidential nomination and caused the rupture of the Democratic National Convention at Charleston in the summer of 1860. For the moment, however, the sophism doubtless satisfied his many warm partisans. He did not dwell on the dangerous point, but trusted for oratorical effect rather to his renewed appeals to the popular prejudice against the blacks, so strong in central Illinois, indorsing and emphasizing Chief-Justice Taney's assertion that negroes were not included in the words of the Declaration of Independence, and arguing that if the principle of equality were admitted and carried out to its logical results, it would necessarily lead not only to the abolition of slavery in the slave States, but to the general amalgamation of the two races.

The Republican party of Illinois had been greatly encouraged and strengthened by its success in electing the State officers in the previous autumn; and as their recognized leader and champion, Lincoln made a reply to this speech some two weeks later, June 26th, 1857, also at Springfield. Though embracing other topics, the question of the hour, the Dred Scott decision, was nevertheless its chief subject. The extracts here presented from it will give the reader some idea of its power of statement and eloquence:

"And now," said Mr. Lincoln, "as to the Dred Scott decision. That decision declares two propositions—first, that a negro cannot sue in the United States courts; and secondly, that Congress cannot prohibit slavery in the territories. It was made by a divided court—dividing differently on the different points. Judge Douglas does not discuss the merits of the decision, and in that respect I shall follow his example, believing I could no more improve on McLean and Curtis, than he could on Taney. He denounces all who question the correctness of that decision, as offering violent resistance to it. But who resists it? Who has, in spite of the decision, declared Dred Scott free, and resisted the authority of his master over him? Judicial decisions have two uses—first, to absolutely determine the case decided, and, secondly, to indicate to the public how other similar cases will be decided when they arise. For the latter use they are called 'precedents' and 'authorities.' We believe as much as Judge Douglas (perhaps more) in obedience to and respect for the judicial department of government. We think its decisions on constitutional questions, when fully settled, should control, not only the particular cases decided, but the general policy of the country, subject to be disturbed only by amendments of the Constitution as provided in that instrument itself. More than this would be revolution. But we

* 19 Howard, pp. 450-1.

think the *Dred Scott* decision is erroneous. We know the Court that made it has often overruled its own decisions, and we shall do what we can to have it overrule this. We offer no resistance to it. Judicial decisions are of greater or less authority as precedents according to circumstances. That this should be so, accords both with common sense and the customary understanding of the legal profession. If this important precedent had been made by the unanimous concurrence of the judges, and without any apparent partisan bias, and in accordance with legal public expectation, and by the steady practice of the departments throughout our history, and had been in no part based on assumed historical facts which are not really true; or, if wanting in some of these, it had been before the Court more than once, and had there been affirmed and re-affirmed through a course of years, it then might be, perhaps, would be, to this, nay, even revolutionary, but to acquiesce in it as a precedent. But when, as is true, we find it wanting in all these claims to the public confidence, it is not resistance, it is not factious, it is not even disrespectful, to treat it as not having yet acquired a settled doctrine for the country."

Rising above all questions of technical construction to the broad and universal aspects of the issue, Mr. Lincoln continued:

"The Chief Justice does not directly assert, but plainly assumes as a fact, that the public estimate of the black man is more favorable now than it was in the days of the Revolution. This assumption is a mistake. In some trifling particulars the condition of that race has been ameliorated; but as a whole, in this country, the change between then and now is decidedly the other way; and their ultimate destiny has never appeared so hopeless as in the last three or four years. In two of the five States—New Jersey and North Carolina—that then gave the free negro the right of voting, the right has since been taken away; and in a third—New York—it has been greatly abridged; while it has not been extended, so far as I know, to a single additional State, though the number of the States has more than doubled. In those days, as I understand, masters could, at their own pleasure, emancipate their slaves; but since then such legal restrictions have been made upon emancipation as to amount almost to prohibition. In those days, legislatures held the unquestioned power to abolish slavery in their respective States; but now it is becoming quite fashionable for State constitutions to withhold that power from the legislatures. In those days, by common consent, the spread of the black man's bondage to the new countries was prohibited; but now Congress decides that it will not continue the prohibition, and the Supreme Court decides that it could not if it would. In those days, our Declaration of Independence was held sacred by all, and thought to include all; but now, to aid in making the bondage of the negro universal and eternal, it is assailed, and sneered at, and construed and hawked at, and torn, till if its framers could rise from their graves they could not at all recognize it. All the powers of earth are rapidly combining against him. Mannon is after him, ambition follows, philosophy follows, and the theology of the day is fast joining the cry. They have him in his prison house, they have searched his person and left no prying instrument with him. One after another they have closed the heavy iron doors upon him; and now they have him, as it were, bolted in with a lock of a hundred keys, which can never be unlocked without the concurrence of every key; the keys in the hands of a hundred different and distant places; and they stand musing as to what invention, in all the dominions of

mind and matter can be produced to make the impossibility of his escape more complete than it is. . . .

"There is a natural disgust in the minds of nearly all white people at the idea of an indiscriminate amalgamation of the white and black races; and Judge Douglas evidently is basing his chief hope upon the chances of his being able to appropriate the benefit of this disgust to himself. If he can by much drumming and repeating fasten the odium of that idea upon his adversaries, he thinks he can struggle through the storm. He therefore clings to this hope as a drowning man to the last plank. He makes an occasion for lugging it in, from the opposition to the *Dred Scott* decision. He finds the Republicans insisting that the Declaration of Independence includes *all* men, black as well as white, and forthwith he boldly denies that it includes negroes at all, and proceeds to argue gravely that all who contend it does, do so only because they want to vote, and eat, and sleep, and marry with negroes. He will have it that they cannot be consistent else. Now I protest against the counterfeit logic which concludes that because I do not want a black woman for a slave I must necessarily want her for a wife. I need not have her for either. I can just leave her alone. In some respects she certainly is not my equal; but in her natural right to eat the bread she earns with her own hands, without asking leave of any one else, she is my equal and the equal of all others.

"Chief-Justice Taney, in his opinion in the *Dred Scott* case, admits that the language of the Declaration is broad enough to include the whole human family; but he and Judge Douglas argue that the authors of that instrument did not intend to include negroes, by the fact that they did not at once actually place them on an equality with the whites. Now this grave argument comes to just nothing at all by the other fact that they did not at once or ever afterwards actually place all white people on an equality with one another. And this is the staple argument of both the Chief-Justice and the senator, for doing this obvious violence to the plain, unmistakable language of the Declaration.

"I think the authors of that notable instrument intended to include all men; but they did not intend to declare all men equal in all respects. They did not mean to say all were equal in color, size, intellect, moral development, or social capacity. They defined with tolerable distinctness in what respects they did consider all men created equal—equal with 'certain inalienable rights, among which are life, liberty, and the pursuit of happiness.' This they said, and this they meant. They did not mean to assert the obvious untruth that all were then actually enjoying that equality, nor yet that they were about to confer it immediately upon them. In fact they had no power to confer such a boon. They meant simply to declare the right, so that the enforcement of it might follow as fast as circumstances should permit. They meant to set up a standard maxim for free society, which should be familiar to all, and revered by all; constantly looked to, constantly labored for, and even though never perfectly attained, constantly approximated, and thereby constantly spreading and deepening its influence and augmenting the happiness and value of life to all people of all colors everywhere. The assertion that 'all men are created equal' was of no practical use in effecting our separation from Great Britain; and it was placed in the Declaration, not for that but for future use. Its authors meant it to be, as, thank God, it is now proving itself, a stumbling-block to all those who in after times might seek to turn a free people back into the hateful paths of despotism. They knew the proneness of prosperity to breed tyrants, and they meant when such should reappear in this fair land and commence their vocation, they should find left for them at least one hard nut to crack."

JACK.

By the author of "The Gates Ajar," "The Madonna of the Tubs," etc.

ACK was a Fairharbor boy. This might be to say any of several things; but it is at least sure to say one,— he was a fisherman, and the son of a fisherman.

When people of another sort than Jack's have told their earthly story through, the biography, the memorial, the obituary remains. Our poet, preacher, healer, politician, and the rest pass on to this polite sequel which society has ordained for human existence. When Jack dies, he stops. We find the fisherman squeezed into some corner of the accident column: "Washed overboard," or "Lost in the fog," and that is the whole of it. He ends just there. There is no more Jack. No fellow-members in the Society for Something-or-Nothing pass resolutions to his credit and the consolation of his family. No funeral discourse is preached over him and privately printed at the request of the parishioners. The columns of the religious weekly to which he did not subscribe contain no obituary sketches signed by the initials of friends not thought to be too afflicted to speak a good word for a dead man. From the press of the neighboring city no thin memorial volume sacred to his virtues and stone-blind to his defects shall ever issue. Jack needs a biographer. Such the writer of this sketch would fain aspire to be.

Jack was born at sea. His father was bringing his mother home from a visit at a half-sister's in Nova Scotia, for Jack's mother was one of those homesick, clannish people who pine without their relations as much as some of us pine with them; and even a half-sister was worth more to her in her fanciful and feeble condition than a whole one is apt to be to bolder souls.

She had made her visit at her half-sister's, and they had talked over receipts, and compared yeast, and cut out baby things, and turned dresses, and dyed flannel, and gone to prayer meetings together; and Jack's mother was coming home, partly because Jack's father came for her, and partly because he happened to come sober, which was a great point, and partly because the schooner had to sail, which was another,— she was coming home, at all events, when a gale struck them. It was an ugly blow. The little two-masted vessel swamped, in short, at midnight

of a moonlit night, off the coast, just the other side of seeing Cape Ann light. The crew were picked up by a three-master, and taken home. Aboard the three-master, in fright and chill and storm, the little boy was born. They always put it that he was born in Fairharbor. In fact, he was born rounding Eastern Point. "The toughest place to be borned in, this side o' Torment," Jack's father said. But Jack's mother said nothing at all.

Jack's father kept sober till he got the mother and the child safely into the little crumbling, gray cottage in half of whose meager dimensions the family kept up the illusion which they called home. Then, for truth compels me, I must state that Jack's father went straightway out upon what, in even less obscure circles than his, it is customary to call "a tear." There seems to be something in the savage, incisive fitness of this word which has overridden all mere distinctions of class or culture, and must ultimately make it a classic in the language. "I've stood it long as I ken stand, and I'm goin' on a tear,— I'm a-goin' on a *netarnal* tear," said Jack's father to his oldest dory-mate, a fellow he had a feeling for, much as you would for an oar you had handled a good many years; or perhaps a sail that you were used to, and had patched and watched, and knew the cracks in it, and the color of it, and when it was likely to give way, and whereabouts it would hold.

In fact, that proved to be, in deed and truth, an eternal tear for Jack's father. Drunk as a fisherman could be,—and that is saying a good deal,—he reshipped that night, knowing not whither nor why, nor indeed knowing that the deed was done; and when he came to himself he was twelve hours out, on his way to the Banks of Newfoundland; and the young mother, with the baby on her arms, looked out of the frosty window over the foot of her old bedstead, and watched for him to come, and did not like to tell the neighbors that she was short of fuel.

She was used to waiting—women are; Fairharbor women always are. But she had never waited so long before. And when, at the end of her waiting, the old dory-mate came in one night and told her that it happened falling from the mast because he was not sober enough to be up there, Jack's mother said she had always expected it. But

she had not expected it, all the same. We never expect trouble, we only fear it. And she had put the baby on the edge of the bed, and got upon her knees upon the floor, and laid her face on the baby, and tried to say her prayers,—for she was a pious little woman, not knowing any better,—but found she could not pray, she cried so. And the old dory-mate told her not to try, but to cry as hard as she could. And she told him he was very kind, and so she did. For she was fond of her husband although he got drunk; because he got drunk, one is tempted to say. Her heart had gone the way of the hearts of drunkards' wives; she loved in proportion to her misery, and gave on equation with what she lost. All the woman in her mothered her husband when she could no longer wifely worship him. When he died she felt as if she had lost her eldest child. So, as I say, she kneeled with her face on the baby, and cried as if she had been the blessedest of wives. Afterward she thought of this with self-reproach. She said one day to the old dory-mate:

"When my trouble came, I did not pray to God. I'd ought to have. But I only cried at Him."

Jack had come into the world in a storm, and he began it stormily. He was a big, roaring baby, and he became a restless boy. His mother's gentle and unmodified femininity was helpless before the problem of this wholly masculine little being. She said Jack needed a man to manage him. He smoked at six; he lived in the stables and on the wharves at eight; he came when he got ready, and went when he pleased; he obeyed when he felt like it, and when he was punished, he kicked. Once, in an imaginative moment, he bit her.

She sent him to pack mackerel, for they were put to it to keep soul and body together, and he brought home such habits of speech as even the Fairharbor woman had never heard. From her little boy, her baby,—not yet old enough to be out of short trousers, and scarcely out of little sacks, had he been *yours*, my Lady; at the pretty age when one still fastens lace collars round their necks, and has them under shelter by dark, and hears their prayers, and challenges the breath of heaven lest it blow too rudely on some delicate forming fiber of soul or body—from her little boy, at eight years old, the mother first learned the abysses of vulgarity in a seaport town.

It must be admitted that her education in this respect had been defective. She had always been one of the women in whose presence her neighbor did not speak too carelessly.

But Jack's mother had the kind of eyes which do not see mire,—the meek, religious, deep-blue eye which even growing sons re-

spect while they strike the tears from it. At his worst Jack regarded her as a species of sacred fact, much like heaven or a hymn. Sometimes on Sunday nights he staid at home with her; he liked to hear her sing. She sang Rock of Ages, in her best black alpaca with her work-worn hands crossed upon the gingham apron which she put on to save the dress.

But ah, she said, Jack needed a man to manage him. And one day when she said this, in spite of her gentle unconsciousness, or because of it, the old dory-mate to whom she said it said he thought so too, and said if she had no objection he would like to be that man.

And the Fairharbor widow, who had never thought of such a thing, said she didn't know as she had; for nobody knew, she said, how near to starving they had come; and it was something to have a sober man. So, on this reasonable basis, Jack acquired a step-father, and his step-father sent him straightway to the Grand Banks.

He meant it well enough, and perhaps it made no difference in the end. But Jack was a little fellow to go fishing,—only ten. His first voyage was hard; it was a March voyage; he got badly frostbitten, and the skipper was rough. He was knocked about a good deal, and had the measles by himself in his berth; and the men said they didn't know they had brought a baby to the Banks, for they were very busy; and Jack lay and cried a little, and thought about his mother, and wished he hadn't kicked her, but forgot it when he got well. So he swaggered about among the men, as a boy does when he is the only one in a crew, and aped their talk, and shared their grog, and did their hard work, and learned their songs, and came home with the early stages of moral ossification as well set in upon his little heart as a ten-year-old heart allows.

The next voyage did not mend the matter; nor the next. And though the old dory-mate was an honest fellow, he had been more successful as a dory-mate than he was as a step-father. He and Jack did not "get on." Sometimes Jack's mother wondered if he *had* needed a man to manage him; but she never said so. She was a good wife, and she had fuel enough, now; she only kissed Jack and said she meant it for the best, and then she went away and sang Rock of Ages to the tune of Martyn, very slow, and quite on the wrong key. It seemed to make her feel better, poor thing. Jack sometimes wondered why.

When he was twelve years old he came home from a winter voyage one night, and got his pay for his share,—boy's pay, yet, for a boy's share; but bigger than it used to be,—and did not go home first, but went rollicking off with a crowd of Portuguese. It was a Sun-

day night, and his mother was expecting him, for she knew the boat was in. His step-father expected him too,—and his money; and Jack knew that. His mother had been sick, but Jack did not know that; she had been very sick, and had asked for him a great deal. There had been a baby,—born dead while its father was off-shore after cod,—and it had been very cold weather; and something had gone wrong.

At midnight of that night some one knocked at the door of the crumbling cottage. The step-father opened it; he looked pale and agitated. Some boys were there in a confused group; they bore what seemed to be a lifeless body on a drag, or bob-sled; it was Jack, dead drunk.

It was the first time,—he was only twelve,—and one of the Fairharbor boys took the pipe from his mouth to explain:

"He was trapped by a Portygee, and they've stole every cent of him, 'n kicked him out 'n lef' him, stranded like a monk-fish, so me and the other fellers we borried a sled and brung him home, for we thought his mother'd rather. He ain't dead, but he's jest as drunk as if he was sixty!"

The Fairharbor boy mentioned this circumstance with a kind of abnormal pride, as if such superior maturity were a point for a comrade to make note of. But Jack's step-father went out softly and shut the door, and said:

"Look here, boys,—help me in with him, will you? Not *that* way. His mother's in there. She died an hour ago."

AND so the curse of his heredity came upon him. She never knew, thank Heaven. Her knowledge would have been a kind of terrible fore-omniscience, if she had. She would have had no hope of him from that hour. Her experience would have left her no illusions. The drunkard's wife would have educated the drunkard's mother too "liberally" for that. She would have taken in the whole scope and detail of the future in one midnight moment's breadth, as a problem in the higher mathematics may rest upon the width of a geometrical point. But she did not know. We say—I mean, it was our fashion of saying—that she did not know. God was merciful. She had asked for Jack, it seemed, over and over, but did not complain of him for not coming; she never complained of Jack. She said the poor boy must have staid somewhere to have a pleasant time; and she said they were to give her love to him, if he came in while she was asleep. And then she asked her husband to sing Rock of Ages for her, because she did not feel very strong. He couldn't sing,—more than a halibut, poor fellow; but he did not like to disappoint her, for he thought she looked what he

called "miser'ble"; so he sat down by the bed and raised his hoarse, weather-beaten voice to the tune of Martyn, as best he could, and mixed up two verses inextricably with a line from "Billy's on the Bright Blue Sea," which he added because he saw he must have something to fill out, and it was all he could think of,—but she thanked him very gently, and said he sang quite well; and said once more that he was to give her love to Jack; and went to sleep afterward; and, by and by, they could not wake her to see her boy of twelve brought to her drunk.

The curse of his heredity was upon him. We may blame, we may loathe, we may wonder, we may despair; but we must not forget. There were enough to blame without remembering. Jack, like all drunkards, soon learned this. In fact, he did not remember it very well himself,—not having been acquainted with his father; and never sentimentalized over himself nor whined for his bad luck,—but owned up to his sins, with the bluntness of an honest, bad fellow. He was rather an honest fellow, in spite of it all. He never lied when he was sober.

If the curse of his ancestry had come upon him, its compensatory temperament came too. Jack had the merry heart of the easy drinker.

Born with his father's alcoholized brain-cells, poor baby, endowed with the narcotined conscience which this species of parentage bequeaths, he fell heir to the kind of attractiveness that goes with the legacy.

He was a happy-go-lucky fellow. Life sat airily on him. He had his mother's handsome eyes dashed with his father's fun (for she couldn't take a joke, to save her); he told a good story; he did a kind deed; he was generous with his money when he had any, and never in the least disturbed when he hadn't. He was popular to the dangerous extent that makes one's vices seem a kind of social introduction, and not in Jack's circle alone, be it said. Every crew wanted him. Drunk or sober, as a shipmate he was at par. It was usually easy for him to borrow. The fellows made up his fines for him, there was always somebody to go bail for him when he got before the police court. Arrested perhaps a half dozen times a year in his maddest years, he never was sent to the House in his life. There were always people enough who thought it a pity to let such a good fellow go to prison. He had—I was going to say as a matter of course he had—curly hair. One should not omit to notice that he was splendidly tattooed. He was proud, as seamen are, of his brawny arms, dashed from wrist to shoulder with the decorative ingenuity of his class. Jack had æsthetic views of his own, indeed, about his personal allowance of indigo. He

had objected to the customary medley of anchors, stars, and crescents, and exhibited a certain reserve of taste, which was rather interesting. On his left arm he bore a very crooked lighthouse rising from a heavy sea; he was, in fact, quite flooded along the bicipital muscle with waves and billows, but nothing else interfered with the massive proportions of the effect. This was considered a masterly design, and Jack was often called upon to push up his sleeve and explain how he came by the inspiration.

Upon the other arm he wore a crucifix, ten inches long; this was touched with blood-red ink; the dead Christ hung upon it, lean and pitiful. Jack said he took the crucifix against his drowning. It was an uncommonly large and ornate crucifix.

Jack was a steady drinker at nineteen. At twenty-five he was what either an inexperienced or a deeply experienced temperance missionary would have called incurable. The intermediate grades had been confidently expected to save him.

Of course he reformed. He would not have been interesting if he had not. The unmitigated sot has few attractions even for seafaring society. It is the foil and flash, the by-play and side-light of character that "lead us on." Jack was always reforming. After that night when he was brought home on the bob-sled, the little boy was as steady and as miserable as he knew how to be for a long time; he drew the unfortunate inference that the one involved the other. By the time his mother's grave was green with the scanty Fairharbor church-yard grass,—for even the sea-wind seems to have a grudge against the very dead for choosing dry graves in Fairharbor, and scants them in their natural covering,—by that time rank weeds had overgrown the sorrow of the homeless boy. He and his step-father "got on" less than ever now, as was to be expected; and when one day Jack announced with characteristic candor that he was going to get drunk, if he went to Torment for it, the two parted company; and the crumbling cottage knew Jack no more. By and by, when his step-father was drowned at Georges', Jack borrowed the money for some black gloves and a hat-band. He had the reputation of being a polite fellow; the fisherman spelled it t-o-n-y. Truth to tell, the old dory-mate had wondered sometimes on Sunday afternoons if he *had* been the man to manage Jack; and felt that the main object of his second marriage had been defeated.

Jack, as I say, was always reforming. Every temperance society in the city had a hand at him. They were of the old-fashioned, easy type which took their responsibilities comfort-

ably. They held him out on a pair of moral tongs and tried to toast his misdemeanors out of him, before a quick fire of pledges and badges; and when he tumbled out of the tongs, and asked the president and treasurer why they didn't bow to him in the street when he was drunk, or why, if he was good enough for them at the lodge-room, he wasn't good enough to shake hands with before folks on the post-office steps, or propounded any of those ingenious posers with which his kind are in the habit of disturbing the benevolent spirit, they snapped the tongs to, and turned him over to the churches.

These touched him gingerly. They invited him into the free pews,—a dismal little row in the gallery,—sent him a tract or two, and asked him a few well-meant and very confusing religious questions to which Jack's replies were far from satisfactory. One ardent person, a recent convert, coaxed him into a weekly prayer-meeting. It was a very good, honest, uninteresting prayer-meeting, and there were people sitting there beside him with clean lives and clear faces whose motives Jack was not worthy to understand, and he knew enough to know it. But it happened to be a foreign mission prayer-meeting, devoted to the Burmese field; which was, therefore, be it said, not so much an argument against foreign missions, as a deficient means of grace to the fisherman. Jack was terribly bored. He ran his hands through his curls, and felt for his tobacco, and whispered to the young convert to know if there weren't any waits in the play so a man could get out without hurting anybody's feelings. But just then the young convert struck up a hymn, and Jack staid.

He liked the singing. His restless, handsome face took on a change such as a windy day takes on toward dusk, when the breeze dies down. When he found they were singing Rock of Ages, he tried to sing it too,—for he was a famous tenor on deck. But when he had sung a line or two,—flash! down in one of the empty pews in front, he saw a thin old lady with blue eyes, sitting in a black alpaca dress with her hands clasped on her gingham apron.

"That's my mother. Have I got the jim-jams?" asked this unaccustomed worshiper of himself. But then he remembered that he was sober. He could sing no longer after this, but bowed his head and looked into his old felt hat, and wondered if he were going to cry, or get religion. In point of fact, he did neither of these things, because a very old church-member arose just then, and said he saw a poor castaway in our midst to night, and he besought the prayers of the meeting for his soul. Jack stopped crying. He looked hard at the old church-member. He knew him; had

always known him. The fisherman waited till that prayer was through,—it was rather a long prayer,—and then he too sprang to his feet. He looked all around the decorous place; his face was white with the swift passion of the drinking man.

"I never spoke in meetin' in my life," said Jack in an unsteady voice. "I ain't religious. I drink. But I'm sober to-night, and I've got something to say to you. I heard what that man said. I know him. He's old Jim Crownoby. I've always know'd Jim Crownoby. He owns a sight of property in this town. He's a rich man. He owns that block on Black street. You know he does. You can't deny it. Nor he can't neither. All I want to say is, I've got drunk in one of them places of his, time again; and if there ain't anybody but *him* to pray for my soul, I'd rather go to the devil."

Jack stopped short, jammed on his hat, and left the meeting. In the shocked rustle that followed, some one had the tact to start "Rescue the Perishing," as the fisherman strode down the broad aisle. He did not go again. The poor young convert followed him up for a week or two, and gave him an expensive Testament, bought out of an almost invisible personal income, in vain.

"I've no objections to you," said Jack candidly; "I'm much obliged to ye for yer politeness, sir. But them churches that sub-leases to a rum-seller, I don't think they onderstand a drinkin' man. Hey? Well, ain't he their biggest rooster, now? Don't he do the heft of the prayin', and the tallest of their crowin', consequent? Thought so. Better leave me go, sir. I ain't a pious man; I'm a fisherman."

"FISHES," said Jack, "is no fools."

He gave voice to this remark one day in Boston, when he was twenty-five years old. He was trying to entertain a Boston girl; she was not familiar with Fairharbor or with the scenery of his calling; he wanted to interest her; he liked the girl. He had liked a good many girls, it goes without saying; but this one had laid upon the fisherman—she knew not how, he knew not why, and what man or woman of us could have told him?—the power that comes not of reason, or of time, or of trying, or of wisdom, or of rightness, but of the mystery to which, when we are not speaking of Jack, we give the name of love. It seems a sacrilege, admit, to write it here, and of these two. But then, again, it would be easy to be wrong. The study of the relativity of human feeling is a delicate science; it calls for a fine moral equipment. If this were the high-water mark of nature for Jack—and who shall say?—the tide shall have its sacred due, even down among those weeds and in that mud.

He liked that girl, among them all, and her he thought of gently. He had known her a long time; as much as three months. When the vessel came into Boston to sell halibut, he had a few days there, drifting about as fishermen do, homeless and reckless; dashing out the wages just paid off, in ways that sometimes he remembered and sometimes he forgot, and that usually left him without a dollar toward his next fine when he should be welcomed by the police court of his native city on returning home.

Jack thought, I say, gravely of this girl. He never once took her name in vain among the fellows, and she had not been a very good girl either. But Jack reflected that he was not very good himself, if you came to that. His downright, honest nature stood him in stead in this moral distinction; there was always a broad streak of generosity in him at his worst; it goes with the temperament, we say, and perhaps we say it too often to give him half the credit of it.

She was a pretty girl, and she was very young. She had told Jack her story, as they strolled about the bright Boston streets on comfortable winter evenings; when he took her to the variety show, or to the oyster-shop, and they talked together. Jack pitied her. Perhaps she deserved it; it was a sad little story—and she was so very young! She had a gentle way, with Jack; for some reason, God knows why, she had trusted him from the first, and he had never once been known to disturb her trust. That was the pleasant part of it.

On this evening that we speak of, Jack was sober. He was often sober when he had an evening to spend with the Boston girl; not always—no; truth must be told. She looked as pretty as was in her that night; she had black eyes and a kind of yellow hair that Jack had never seen crinkled low on the forehead above black eyes before; he thought her as fine to look at as any actress he ever saw; for the stage was Jack's standard of the magnificent, as it is to so many of his sort. The girl's name was Teen. Probably she had been called Christine once, in her country home; she even told Jack that she had been baptized.

"I wasn't myself," said Jack; "I roared so, they darsen't do it. My mother got me to church, for she was a pious woman, and I pummeled the parson in the face with both fists, and she said she come away, for she was ashamed of me. She always said that christenin' wasn't never legal. It disappointed her, too. I was an awful baby."

"I should think likely," said Teen with candor. "Do you set much by your mother?"

"She's dead," said Jack in a subdued voice.

"I AIN'T RELIGIOUS. I DRINK."

Teen looked at him; she had never heard him speak like that.

"I most wished mine was," said the girl; "she'd 'a' b'en better off—along of me."

"That's so," said Jack.

The two took a turn in silence, up and down the brightly lighted street; their thoughts looked out strangely from their marred young faces; they felt as if they were in a foreign country. Jack had meant to ask her to take a drink, but he gave it up; he couldn't, somehow.

"Was you always a fisherman?" asked Teen, feeling, with a woman's tact, that somebody must change the current of the subject.

"I was a fisherman three generations back," Jack answered her; "borned a fisherman, you bet! I couldn't 'a' b'en nothin' else if I'd drowned for it. It's a smart business. You hev to keep your wits about you. Fishes is no fools."

"Ain't they?" asked the girl listlessly. She was conscious of failing in conversational brilliancy; but the truth was, she couldn't get over what they had been saying: it was always unfortunate when she remembered her mother. Jack began to talk to her about his business again, but Teen did not reply; and when he looked down at her to see what ailed her, there were real tears rolling over her pretty cheeks.

"Way, Teen!" said Jack.

"Leave go of me, Jack," said Teen, "and let me get off; I ain't good company to-night. I've got the dumps. I can't entertain ye, Jack."

And Jack—don't let's talk about mothers next time, will we? It spoils the evenin'. Leave go of me, and I'll go home by my own self. I'd rather."

"I won't leave go of you!" cried Jack with a sudden blazing purpose lighting up all the corners of his soul. It was a white light, not unholy; it seemed to shine through and through him with a soft glow like a candle on an altar. "I'll never leave go of you, Teen, if you'll say so. I'd rather marry you."

"Marry *me*?" said Teen.

"Yes, marry you. I'd a sight rather. There, now! It's out with it. What do you say to that, Teen?"

Teen wiped away the tears that fell for her mother with one slow finger-tip. A ring on her finger glistened in the light as she did this. She saw the sparkle, tore off the ring and dashed it away; it fell into the mud, and was trodden out of sight instantly. Jack sprang gallantly to pick it up.

"Don't you touch it!" cried the girl. She put her bared hand back upon his arm; the ring had left a little mark upon her finger; she glanced at this, and up into Jack's handsome face; he looked very kind!

"Jack, dear," said Teen softly, "I ain't fit to marry ye."

"You're fitter'n I be," answered Jack manfully. Teen sighed; she did not speak at once: other tears came now, but these were

"ROCK OF AGES!"

tears for herself and for Jack. Jack felt this, after his fashion; they gave him singular confusion of mind.

"I wouldn't cry about it, Teen. You needn't have me if you don't want to."

"But I *do* want to, Jack."

"Honest?"

"Honest it is, Jack."

"Will ye make a good wife, Teen?" asked Jack, after some unprecedented thought.

"I'll try, Jack."
 "You'll never go back on me, nohow?"
 "I don't that sort!" cried the girl, drawing herself up a little. A new dignity sat upon her with a certain grace which was beautiful to see.
 "Will you swear it, Teen?"
 "If you'd rather, Jack."
 "What'll you swear by, now?" asked Jack.
 "You must swear by all you hold holy."
 "What do I hold holy?" mused Teen.
 "Will you swear," continued Jack seriously, "will you swear to me by the Rock of Ages?"
 "Who's that?" asked the girl.
 "It's a hymn-tune. I want you to swear me by the Rock of Ages that you'll be that you say you will, to me. Will you do it, Teen?"
 "Oh, yes," said Teen. "I'll do it. Where shall we come across one?"
 "I guess I can find it," Jack replied. "I can find most anything I set out to."

So they started out at random, in their reckless fashion, in the great city, to find the Rock of Ages for the asking.

Jack led his companion hither and yon, peering into churches, and vestries, and missions, and wherever he saw signs of sacred things. Singing they heard abundantly in the gay town; songs merry, mad, and sad; but not the song for a girl to swear by, that she would be true wife to a man who trusted her.

Wandering thus, on the strange errand whose pathos was so far above their own dream or knowledge, they chanced at last upon the place, and the little group of people known in that part of Boston as Mother Mary's meeting.

The girl said she had been there once, but that Mother Mary was too good for her; she was one of the real kind. Everybody knew Mother Mary, and her husband: he was a parson. They were poor folks themselves, Teen said, and understood poor folks, and did for

them all the year round, not clearing out like rich ones when it came hot weather, but stood by 'em, Teen said. They kept the little room open, and if you wanted a prayer you went in and got it, just as you'd call for a drink or a supper; it was always on hand for you, and a kind word sure to come with it, and you always knew where to go for 'em; and Mother Mary treated you like folks. She liked her, Teen said. If she'd been a different girl, she'd have gone there of a cold night all winter. But Teen said she felt ashamed.

"I guess she'll have what I'm after," said Jack. "She sounds like she would. Let's go in and see."

So they went into the quiet place, among the praying people, and stood staring, for they felt embarrassed. Mother Mary looked very white and peaceful; she was a tall, fair woman; she wore a black dress with white about the bosom; it was a plain, old dress, much mended. Mother Mary did not look rich, as Teen had said. The room was filled with poor creatures gathered about her, like her children, while she talked with them and taught them as she could. She crossed the room immediately to where the young man stood, with the girl beside him.

"We've come," said Jack, "to find the Rock of Ages." He drew Teen's hand through his arm, and held it for a minute; then, moved by some fine instinct mysterious to himself, he lifted and laid it in Mother Mary's own.

"Explain it to her, ma'am," he said; "tell her, won't you? I'm going to marry her if she'll have me. I want her to swear by something holy she'll be a true wife to me. She hadn't anything particularly holy herself, and the holiest thing I know of is the Rock of Ages. I've heard my mother sing it. She's dead. We've been huntin' Boston over to-night after the Rock of Ages."

THE CRUMBLING COTTAGE.

TEEN AND HER BABY

Mother Mary was used to the pathos of her sober work, but the tears sprang now to her large and gentle eyes. She did not speak to Jack,—could not possibly, just then; but, delaying only for the moment till she could command herself, she flung her rich, maternal voice out upon the words of the old hymn. Her husband joined her, and all the people present swelled the chorus.

“Rock of Ages, cleft for me!
Let me hide myself in thee;
Be of sin the double cure;
Cleanse me from its guilt and power.”

They sang it all through,—the three verses that everybody knows,—and Jack and Teen stood listening. Jack tried to sing himself; but Teen hid her face, and cried upon his arm.

“Thou must save,” sang the praying people; “Thou must save, and thou alone!”

The strain died solemnly; the room was quiet; the minister yonder began to pray, and all the people bowed their heads. But Mother Mary stood quite still with the girl’s hand trembling in her own.

“Swear it, Teen?” Jack bent down his curly head and whispered; he would not

shame his promised wife before these people. “Swear by *that*, you’ll be true wife to me?”

“I swear it, Jack,” sobbed Teen. “If *that’s* the Rock of Ages, I swear by it, though I was to die for it, I’ll be an honest wife to you.”

“COME back when you’ve got your license,” said Mother Mary, smiling through her tears, “and my husband will marry you if you want him to.”

“We’ll come to-morrow,” Jack answered gravely.

“Jack,” said Teen in her pretty way,—for she had a very pretty way,—“if I’m an honest wife to you, will you be *kind* to me?” She did not ask him to swear it by the Rock of Ages. She took his word for it, poor thing. Women do.

MOTHER MARY’S husband married them next

day at the Mission meeting; and Mother Mary sat down at the melodeon in the corner of the pleasant place, and played and sang Toplady’s great hymn for them, as Jack had asked her. It was his wedding march. He was very sober and gentle,—almost like a better man. Teen thought him the handsomest man she had ever seen.

“Oh, I say, Teen,” he nodded to her as they walked away, “one thing I forgot to tell you,—I’m reformed.”

“Are you, Jack?”

“If I ever drink a drop again, so help me —” But he stopped.

“So help you, Rock of Ages?” asked the new-made wife. But Jack winced; he was honest enough to hesitate at this.

“I don’t know’s I’d darst — *that*,” he added ruefully. “But I’m reformed. I have lost all hanker for liquor. I shall never drink again. You’ll see, Teen.”

Teen did see, as was to be expected. She saw a great deal, poor thing. Jack did not drink,—for a long time; it was nearly five months, for they kept close count. He took her to Fairharbor, and rented the old half of the crumbling cottage where his mother used

to sit and watch for him on long, late evenings. The young wife did the watching now. They planted some cinnamon rose-bushes by the doorsteps of the cottage, and fostered them affectionately. Jack was as happy and sober as possible to begin with. He packed the cinnamon roses and brought them in for his wife to wear. He was proud to have a home of his own; he had not expected to; in fact he had never had one since that night when his mother said they were to give her love to him, if he came home while she was asleep. He had beaten about so, sleeping for the most part in his berth, and sailing again directly; he had never had any place, he said, to hang his winter clothes in; closets and bureaus seemed treasure-houses to him, and the kitchen-fire a luxury greater than a less good-looking man would have deserved. When he came home, drenched and chilly, from a winter voyage, and Teen took the covers off, and the fiery heat of the coals leaped out to greet him, and she stood in the rich color, with her yellow hair, young and fair and sweet as any man's wife could look, and said she had missed him, and called him her dear husband, Jack even went so far as to feel that Teen was the luxury. He treated her accordingly; that was at first. He came straight home to her; he kept her in flour and fuel; she had the little things and the gentle words that women need. Teen was very fond of him. This was the first of it,—I was going to say this was the worst of it. All there was of Teen seemed to have gone into her love for Jack. A part of Jack had gone into his love for Teen. Teen was very happy, to begin with. The respectable neighbors came to see her, and said, "We're happy to make your acquaintance." Nobody knew that it had not always been so that Teen's acquaintance would have been a source of social happiness. And she wrote to her mother that she was married; and her mother came on to make her a little visit; and Teen cried her soul out for joy. She was very modest and home-keeping and loving; no wife in the land was truer than this girl he had chosen was to the fisherman who chose her. Jack knew that. He believed in her. She made him happy; and therefore she kept him right.

All this was at first. It did not last. Why should we expect that, when we see how little there is in the relation of man and woman which lasts? If happy birth and gentle rearing, and the forces of what we call education, and the silken webs of spun refinements, are so strained in the tie which requires two who cannot get away from each other to make each other happy, how should we ask, of the law of chances, the miracle for Teen and Jack?

There was no miracle. No transubstantiation of the common bread to holy flesh was wrought upon that poor altar. Their lot went the way of other lots, with the facts of their history dead against them. Trouble came, and poverty, and children, and care, and distaste. Jack took to his old ways and his wife to the tears that they bring. The children died; they were poor sickly babies who wailed a little while in her arms, and slipped out because there wasn't enough to them to stay. And the gray house was damp. Some said it was diphtheria; but their mother said it was the will of God. She added, Might his will be done! On the whole she was not sorry. Their father struck her when he was in liquor. She thought if the babies lived they might get hurt. A month before the last one was born she showed to Jack's biographer a bruise across her shoulder, long and livid. She buttoned her dress over it with hasty repentance:

"Maybe I'd oughtn't to have told," she said. "But he said he'd be *kind* to me."

Jack was very sorry about this when he was sober. He kissed his wife, and bought a pair of pink kid shoes for the baby; which it never grew large enough to wear.

I am not writing a temperance story, only the biography of a fisherman, and a few words will say better than many how it was. Alcoholized brain-cells being one of the few bequests left to society which the heirs do not dispute, Jack went back to his habits with the ferocity that follows abstinence. Hard luck came. Teen was never much of a house-keeper; she had left her mother too early; had never been taught. Things were soggy, and not always clean; and she was so busy in being struck and scolded, and in bearing and burying babies, that it grew comfortless beside the kitchen fire. The last of the illusion which had taken the name of home within the walls of the crumbling half-cottage withered out of it, just as the cinnamon roses did the summer Jack watered them with whisky by a little emotional mistake.

A worse thing had happened too. Some shipmate had "told" in the course of time; and Teen's pre-matrimonial story got set adrift upon the current — one of the cruelest currents of its kind — of Fairharbor gossip. The respectable neighbors made her feel it, as only respectable neighbors do such things. Jack, raging, overheard her name upon the wharves. Teen had been "that she said she would" to him. He knew it. No matron in the town had kept her life or heart more true. In all her sickness and trouble and slackness, and in going cold or hungry, and in her vivid beauty that none or all of these things could quench, Teen had carried a sweet dignity of

her own as the racer in the old Promethean festival carried the torch while he ran against the wind. Jack knew,—oh, yes, he knew. But he grew sullen, suspicious. When he was drunk he was always jealous; it began to take that form. When he was sober he still admired his wife; sometimes he went so far as to remember that he loved her. When this happened, Teen dried her eyes, and brushed her yellow hair, and washed up the kitchen floor, and made the coffee, and said to the grocer when she paid for the sugar:

“My husband has reformed.”

One night Jack came home unexpectedly; a strange mood sat upon him, which his wife did not find herself able to classify by any of the instant and exquisite perceptions which grow, like new faculties, in wives. He had been drinking heavily when he left her, and she had not looked for him for days; if he sailed as he was, it would be a matter of weeks. Teen went straight to him; she thought he might be hurt; she held out her arms as she would to one of her children; but he met her with a gesture of indifference, and she shrank back.

“She’s here,” said Jack. “Mother Mary’s in this d—— town. I see her.”

“I wish she’d talk to you,” said Teen, saying precisely the wrong thing by the fatal instinct which so often possesses drunkards’ wives.

“You do, do you?” quoth Jack. “Well, I don’t. I haven’t give her the chance.” He crushed on his hat and stole out of the house again.

But his mood was on him yet; the difference being that his wife was out of it. He sulked and skulked about the streets alone for a while; he did not go back to the boys just then, but wandered with the apparent aimlessness in which the most tenacious aims are hidden. Mother Mary and her husband were holding sailors’ meetings in the roughest quarter of the town. There was need enough of Mother Mary in Fairharbor. A crowd had gathered to hear the novelty. Fairharbor seamen were none too used to being objects of consideration; it was a matter of mark that a parson and a lady should hire a room from a rich fish-firm, pay for it out of their own scanty pockets, and invite one in from deck or wharf, in one’s oil-clothes or jumper, to hear what a messmate of Jack’s called “a high-toned prayer.” He meant perhaps to convey the idea that the petition treated the audience politely.

Jack followed the crowd in the dark, shrinking in its wake, for he was now sober enough not to feel like himself. He waited till the last of the fellows he knew had gone into the

place and then crept up on tiptoe, and put his face against the window of the salt-cod warehouse where the little congregation was gathered, and looked in. The room was full and bright. It wore that same look of peace and shelter which he remembered. Mother Mary stood as she had stood before, tall and pale in her black dress with the white covering on her bosom. Her husband had been speaking to the fishermen, and she, as Jack put his gnarled hand to his excited eyes, and his eyes to the window-glass, turned her face full about, to start the singing. She seemed to Jack to look at him. Her look was sad. He felt ashamed, and cowered down below the window-sill. But he wanted to hear her sing,—he had never heard anybody sing like Mother Mary,—and so he staid there for a little while, curled against the fish-house. It began to rain and he was pretty wet; but Jack was in his jumper, and a ragged old jumper at that; he knew he was not so handsome as he used to be; he felt that he cut a poor figure even for a drunken fisherman; all the self-respect that life had left him shrank from letting Mother Mary see him. Jack would not go in. A confused notion came to him, as he crouched against the warehouse, in the showers, that it was just as well it should rain on him; it might wash him. He pushed up his sleeves, and let the rain fall on his arms. He found an old Cape Ann turkey box there was lying about, turned it edge-wise so that one ragged knee might rest upon it, and thus bring his eye to a level with the window-sill, while yet he could not be seen from within. So he crouched listening. The glimmer from the prayer-room came across the fisherman’s bared right arm, and struck the crucifix. Jack had the unconscious attitude of one sinking, who had thrown up his arms to be saved. The Christ on the crucifix looked starved and sickly. Jack did not notice the crucifix.

At this moment, Mother Mary’s yearning voice rang out above the hoarse chorus of the fishermen, whose weather-ragged and reverent faces lifted themselves mistily before her, as if they had been the countenance of one helpless man:

“Rock of Ages, cleft for me!”

“Oh, my God!” cried Jack.

It was the next day that some one told Mother Mary, at the poor boarding-house where she staid, that a woman wanted a few words with her. The visitor was Teen. She was worn and wan and sobbing with excitement. Her baby was soon to be born. She did not look as if she had enough to eat. She had come, she said, just to see Mother Mary,

just to tell her, for Jack never would tell himself; but she was sure her husband had reformed; he would never drink again; he meant to be a sober man; and Mother Mary ought to know she did it, for she did, God bless her!

"I've walked all this way to bless you for myself," said Teen. "I ain't very fit for walkin' nor I can't afford a ferry-ticket, for he didn't leave me nothin' on this trip, but I've come to bless you. My husband come to your meetin', Mother Mary, by himself, Jack did. He never goes to no meetin's,—nobody couldn't drive him; but he come to yours, because he says you treat a man like folks, and he wouldn't go inside, for he'd b'en drinkin' and he felt ashamed. So he set outside upon a box behind the winder and he peeked in. And he said it rained on him while he set peekin', for he wanted to get a look at you. And he come home and told me, for we'd had some words beforehand, and I was glad to see him. I was settin' there and cryin' when he come. 'I wouldn't, Teen,' says he, 'for I've seen Mother Mary, and I'm reformed,' says he. So he told me how he set upon the box and peeked. He says you looked straight at him. He says you stood up very tall and kind of white. He says you read something out of a book, and then you sang to him. He says the song you sang was Rock of Ages, and it made him feel so bad I had to cry to see him. He come in and he got down on the lounge against our window, and he put his hand acrost his eyes and groaned like he was hurted in an accident. And he says, 'Teen, I wished I was a better man.' And I says, 'Jack, I wished you was.' And he says, 'I lost the hanker when I heard her sing the Rock of Ages, and if I lost the hanker, I could swear off.' So I didn't answer him, for if I says 'do swear off,' he'd just swear on,—they won't, you know, for wives. But I made him a cup of coffee, for I didn't know what else to do, and I brought it to him on the lounge, and he thanked me. 'Teen,' he says, 'I'll never drink a drop again, so help me, Mother Mary!' And then he kissed me, for they don't, you know, after you've been married. And he's gone out haddockin', but we parted very kind. And so I come to tell you, for it mayn't be many days that I could walk it, and I've been that to him as I said I should, and I thought you'd better know."

"You've had no breakfast," answered Mother Mary, "and you've walked too far. Here, stop at the Holly Tree as you go home; get a bowl of soup; and take the ferry back. There, there! don't cry quite so hard. I'll try to stay a little longer. I won't leave town till Jack comes in. It *takes* the Rock of Ages to cure the hanker, Teen. But I've seen old-

er men than he is stop as if they had been stopped by a lasso thrown from heaven. If there's any save in him," added Mother Mary below her breath, "he shall have his chance, this time."

He went aboard sober, and sober he staid. He kept a good deal by himself and thought of many things. His face paled out and refined, as their faces do, from abstinence; the ghost of his good looks hovered about him; he mended up his clothes; he did a kind turn to a messmate now and then; he told some excellent clean stories, and raised the spirits of the crew; he lent a dollar to a fellow with the rheumatism who had an indebtedness to liquidate for medicine. When he had done this, he remembered that he had left his wife without money, and said aloud: "That's a — mean trick to play on a woman."

He had bad luck, however, that trip; his share was small; he made seven dollars and twenty-seven cents in three weeks. This was conceded by the crew of the fishing-schooner (her name was the *Destiny*) to be because Jack had, "sworn off." It is a superstition among them. One unfamiliar with the lives of these men will hammer cold iron if he thinks to persuade them that rum and luck do not go together; or that to "reform" does not imply a reduction of personal income. You might as well try to put the fisherman's fist into a Honiton lace jumper, as the fisherman's mind into proportion upon this point.

Therefore Jack took his poor trip carelessly; it was to be expected; he would explain it to Mother Mary when he got in. He drank nothing at all; and they weighed for home.

When Jack stepped off the *Destiny*, at Zephaniah Salt & Co.'s wharf at Fairharbor, after that voyage, clean, pale, good-natured, and sober, thinking that he would get shaved before he hurried home to Teen, and wishing he could pay the grocer's bill upon the way, and thinking that, in default of this, he would start an account at the market, and carry her a chop or a sausage, in fact thinking about her with an absorption which resembled consideration if not affection,—suddenly he caught her name upon the wharves.

It may have been said of accident, or of the devil,—God knew; they may have been too drunk to notice Jack at the first, or they may have seen and scented from afar the bad blood they stirred, like the hounds they were. It will never be told. The scandal of these places is incredibly barbarous; but it is less than the barbarity of drinking men to a man who strikes out from among themselves, and fights for his respectability.

The words were few,—they are not for us,—but they were enough to do the deed. Jack

was quite sober. He understood. They assailed the honor of his home, the truth of his wife; they hurled her past at her and at himself; they derided the trust which he had in her in absence; they sneered at the "reformed man" whose domestic prospects were—as they were; they exulted over him with the exultation in the sight of the havoc wrought, which is the most inexplicable impulse of evil.

Everybody knew how hot-blooded Jack was; and when the fury rushed red over his face painted gray by abstinence, there was a smart scattering upon the wharves.

His hand clapped to his pockets; but his was an old, cheap, rusty pistol (he had swapped a Bible and his trawls for it once, upon a spree, and got cheated); it held but one cartridge, and his wrist shook. The shot went sputtering into the water, and no harm came of it. Jack jammed the pistol back into his pocket; he glared about him madly, but had his glare for his pains; the men were afraid of him; he was alone upon the wharf.

It can hardly be said that he hesitated. Would that it could. Raving to himself,—head down, hands clenched, feet stumbling like a blind man's,—the fisherman sank into the first open door he staggered by, as a seiner pierced by an invisible swordfish sinks into the sea. He had fifteen such places to pass before he reached his house. His chances were—as they were—at best.

He drank for half an hour—an hour—a half more—came out, and went straight home.

It was now night of a February day. It had not been a very cold day; a light, clean snow had fallen, which was thawing gently. Jack, looking dimly on through his craze, saw the light of his half of the gray cottage shining ahead; he perceived that the frost was melted from the windows. The warm color came quietly down to meet him across the fresh snow; it had to him in his delirium the look of a woman's eyes when they are true, and lean out of her love to greet a man. He did not put this to himself in these words, but only said:

"Them lamps look like she used to,—curse her!" and so went hurtling on.

He dashed up against the house, as a bowsprit dashes on the rocks, took one mad look through the unfrosted window, below the half-drawn curtain, and flung himself against the door, and in.

His wife sat there in the great rocking-chair, leaning back; she had a pillow behind her and her feet on the salt-fish box which he had covered once to make a cricket for her, when they were first married. She looked pale and pretty,—very pretty. She was talking to a visitor

who sat upon the lounge beside her. It was a man. Now, Jack knew this man well; it was an old mess-mate; he had sworn off, a year ago, and they had gone different ways; he used to be a rough fellow; but people said now you wouldn't know him.

"I ain't so drunk but I see who you be, Jim," began the husband darkly; "I'll settle with *you* another day. I've got that to say to my wife I'd say better if we missed your company. Leave us by ourselves!"

"Look here, Jack," Jim flashed good-humoredly, "you're drunk, you know. She'll tell you what I come for. You ask her. Seein' she wasn't right smart,—and there's them as says she lacked for victuals,—my wife sent me over here with a bowl of cranberry sass, so help me Heaven."

"I'll kill *you* some other evenin'. Leave us be!" cried Jack.

"We was settin' and talkin' about the Reform Club when you come in," objected Jim, with the patience of an old friend. "We was wonderin' if we couldn't get you to sign, Jack. Ask her if we wasn't. Come, now! I wouldn't make a fool of myself if I was you, Jack. See there. You've set her to cryin' already. And she ain't right smart."

"Clear out of my house!"* thundered Jack. "Leave us be by ourselves!"

"I don't know's I'd ought to," hesitated Jim.

"Leave us be! or I won't leave *you* be a d— minute longer! Ain't it my house? Get out of it!"

"It is, that's a fact," admitted the visitor, looking perplexed; "but I declare to Jupiter I don't know's I'd oughter leave it, the way things look. Have your senses, Jack, my boy! *Have* your senses! She ain't right smart."

But with this Jack sprang upon him, and the wife cried out between them, for the love of mercy, that murder would be done.

"Leave us be!" she pleaded, sobbing. "Nothin' else won't pacify him. Go, Jim, go, and shut the door, and thank her, for the cranberry sarse was very kind of her, and for my husband's sake don't tell nobody he wasn't kind to me. There. That's right. There."

She sank back into the rocking-chair, for she was feeble still; and looked gently up into her husband's face. All the tones of her agitated voice had changed.

She spoke very low, and calmly; as if she gathered her breath for the first stage of a struggle whose nature she solemnly understood. She had grown exceedingly pale.

"Jack, dear?" softly.

* Such peculiarities of Jack's pronunciation as were attributable to his condition will not be reproduced here.

"I'll give ye time," he answered with an ominous quiet. "Tellyer story first. Out with it!"

"I haven't got nothin' to tell, Jack. He brought the cranberry sarse, for his wife took care of me, and she was very kind. And he set a little and we was talkin' about the club, just as he says we was. It's Mother Mary's club, Jack. She's made Jim secretary, and she wanted you to join, for I told her you'd reformed. Oh, Jack, I told her you'd reformed!—Jack, Jack! Oh, Jack! What are you gonn' to do to me! What makes you look like that?—Jack, Jack, *Jack!*"

"Stand up here!" he raved. He was past reason, and she saw it; he tore off his coat and pushed up his sleeves from his tattooed arms.

"You've played me false, I say; I trusted ye, and you've tricked me. I'll teach ye to be the talk upon the wharves another time when I get in from Georges'!"

She stood as he bade her, tottered and sank back; crawled up again, holding by the wooden arm of the rocking-chair, and stretched one hand out to him, feebly. She did not dare to touch him; if she had clung to him, he would have throttled her. When she saw him rolling up his sleeves, her heart stood still. But Teen thought:

"I will not show him I'm afraid of him. It's the only chance I've got."

The poor girl looked up once into his face, and thought she smiled.

"Jack? *Dear Jack!*"

"I'll teach ye! I'll teach ye!"

"Oh, wait a moment, Jack. For the love of Heaven,—stop a minute! I've been that I said I'd be to you, since we was married. I've been an honest wife to you, my boy, and there's none on earth nor heaven as can look me in the eye and darst to say I haven't. I swore to ye upon the Rock of Ages, Mother Mary witnessin',—why, Jack!" her voice sank to infinite sweetness, "have ye forgotten? You ain't yourself, poor boy. You'll be so sorry. I ain't very strong, yet,—you'd feel bad if you should hit me,—again. I'd hate to have you feel so bad. Jack dear, don't. Go look in the other room, before you strike again. Ye hadn't seen it yet. Jack, for the love of mercy!—Jack! Jack!"

"Say you've played me false, and I'll stop. Own up, and I'll quit. Own up to me, I say!"

"I can't own up to you, for I swore you by the Rock of Ages; I swore ye I would be an honest wife. You may pummel me to death, but I'll not lie away them words I swore to ye . . . by that, . . . Jack, for the love of Heaven, don't ye, Jack! For the way you used to feel to me, dear, dear Jack! For the sake of the babies we had, . . . and you walked beside of me, to bury 'em! Oh, for

God's sake. . . . *Jack!* . . . Oh, you said you'd be *kind* to me. . . . Oh, ye'll be so sorry! For the love of pity! For the love of God! Not the *pistol!* Oh, for the Rock of——."

But there he struck her down. The butt end of the weapon was heavy enough to do the deed. He struck, and then flung it away.

Upon his bared arm, as it came crashing, the crucifix was spattered red.

He stood up stupidly and looked about the room. The covers were off the kitchen stove, and the heart of the coals blazed out. Her yellow hair had loosened as she fell, and shone upon the floor.

He remembered that she spoke about the other room, and said of something yonder, that he hadn't seen it yet. Confusedly he wondered what it was. He stumbled in and stared about the bedroom. It was not very light there, and it was some moments before he perceived the cradle, standing straight across his way. The child waked as he hit the cradle, and began to cry, stretching out its hands.

He had forgotten all about the baby. There had been so many.

"You'd better get up, Teen," he said as he went out; "it's cryin' after you."

He shut the door and staggered down the steps. He hesitated once, and thought he would go back and say to her:

"What's the use of layin' there?"

But he thought better, or worse, of it, and went his way. He went out and reshipped at once, lingering only long enough to drink madly on the way, at a place he knew where he was sure to be let alone. The men were afraid of Jack, when he was so far gone under as this. Nobody spoke to him. He went down to Salt Brothers' wharf, opposite Salt & Co.'s, and found the *Daredevil*, just about to weigh. She was short by one hand, and took him as he was.

He was surprised to find himself aboard when the next sun went down; he had turned in his bunk and was overheard to call for Teen, ordering her to do some service for him, testily enough.

"Oh," he muttered, "she ain't here, is she? Be blasted if I ain't on the *Daredevil!*"

He was good for nothing, for a matter of days, and silent or sullen for the trip. It had been a very heavy spree. He fell to, when he came to himself, and fished desperately; his luck turned, and he made money; he made seventy-five dollars. They were gone three weeks. They had a bitter voyage, for it was March. They struck a gale at Georges', and another coming home. It snowed a great deal, and the rigging froze. The crew were

uncommonly cold. They kept the steward cooking briskly, and four or five hot meals a day were not enough to keep one's courage up. They were particular about their cooking, as fishermen are, and the steward of the *Daredevil* was famous in his calling. But it was conceded to be unusually cold, even for March, at Georges'. One must keep the blood racing, somehow, for life's sake.

Whisky flowed fast between meals. Jack was observed not to limit himself. "It was for luck," he said. Take it through, it was a hard trip. The sober men — there were some — looked grim and pinched; the drinkers ugly.

"It's a hound's life," said a dory-mate of Jack's one day. His name was Rowe — Rowe Salt; he was a half-brother of Jim's. But Jim was at home. And Teen, of course, was at home. Jack had not spoken of her; he had thought of her, — he had thought of nothing else. God knows what those thoughts had been. When Rowe spoke to him in this fashion, Jack looked hard at him.

"I've been thinkin' ef it disobligated a feller," he said.

"Hey?" asked Rowe.

"If you was treated like folks; but you ain't. You're froze. You're soaked. You're wrecked. Your nets is stole. You're drove off in the fog. You're drowneded, and you lose your trawls. If you swear off, you miss your luck. It's dirty aboard. Folks don't like the looks of you. There's alwers a hanker in the pit o' your stomick. When you get upon a tear you don't know what you — do to — folks."

Jack stopped himself abruptly, and leaned upon his oar; they were trawling, and the weather grew thick.

"Rowe," he said, staring off into the fog, "did ye ever think we was like fishes, us Fair-harbor folks?"

"I don't know's I hev," said the dory-mate, staring too.

"Well, we be, I think. We live in it and we're drowneded in it, and we can't get out on't, — we can't *get* out. We look like 'em too. I've thought about that. Some of us look like haddock. You've got the halibut look yourself. Skipper, he's got the jib of a monk-fish, — you ken see it for yourself. There's a man I messed with, once, reminded me of a sculpin. I guess I'd pass for a lobster, myself, — for color, anyhow. We take it out someways, each on us. Don't ye know the look the women folks have when they get old and have gone hungry? You can tell by the build of a boy which way he'll turn out, — halibut way, or hake, or mebbe mackerel if he's sleek and little. It's a kind of a birth-mark, I shouldn't wonder. There's no gettin' out on't, no more'n it out of you. Sometimes I used to think —

"Good Lord!" cried Jack. He laid down his oar again, and the dory wheeled to star-board sharply.

"Rowe Salt, you look there! you tell me if you see a woman yonder on the water!"

"You've got the jim-jams, Jack. Women folks don't walk at Georges. I can't see nothin' nowhere, but it's thick as —"

"It's thick as hell," interrupted Jack, "and there's a woman walkin' on the water, — Lord! don't you see her? Lord! her hair is yellor hair, and it's streamin' over her, — don't *you* see her? She's walkin' on this devilish fog towards the dory, — Teen? Teen! There! Lord save me, Rowe, if I didn't see my wife come walkin' towards us, us settin' in this dory. — Hi-i-igh! I'll swear off when I get home. I'll tell her so. I hate to see such things.

"You see, Rowe," Jack added presently, — for he had not spoken after that, but had fallen grimly to work. It was ten below and the wind was taking the backward spring for a bitter blow; both men, tugging at their trawls through the high and icy sea, were suffering too much to talk, — "ye see we had some words before I come aboard, and she warn't right smart. The baby can't be very old. I don't know how old it is. I was oncommon drunk; I don't remember what I did to her. I'm afraid I hit her, — for I had some words with her. I wished I was at home. She won't tell nobody. She never does. But I'm set to be at home and tell her I've sworn off. I've got money for her this trip too; I'm afraid she's in a hurry for it."

After this outburst of confidence, Jack seemed to cling to his dory-mate; he followed him about deck, and looked wistfully at him. Jack had begun to take on the haggard look of the abstainer once again. The crew thought he did not seem like himself. He had stopped drinking, abruptly, after that day in the fog, and suffered heavily from the weather and from exposure.

"I say, Rowe," he asked one day, "if anything was to happen, would you jest step in and tell my wife I didn't believe that yarn about her? She'll know."

Now it befell, that when they were rounding Eastern Point, and not till then, they bespoke the *Destiny*, which was outward bound, and signaled them. She drew to speaking distance, and her skipper had a word with the master of the *Daredevil*, but he spoke none too loud, and made his errand quickly, and veered to his own course, and the two boats parted company, and the *Daredevil* came bustling in. They were almost home.

It was remembered afterward that Jack was badly frostbitten upon that voyage; he looked badly; he had strange ways; the men did not

know exactly how to take him. He was overheard to say:

"I ain't a-goin' to go to Georges' again."

Rowe Salt overheard this, after the skipper of the *Destiny* had signaled and tacked. Jack was sitting aft alone, when he said it, looking seaward. He had paid little or no attention to the incident of the *Destiny*, but sat staring, plunged in some mood of his own which seemed as solitary, as removed from his kind and from their comprehension, as the moods of mental disorder are from the sane.

So then, with such dexterity as the ignorant man could muster, Salt got his friend below, on some pretext, and stood looking at him helplessly.

"You don't look well, Rowe," Jack suggested pleasantly.

"Jack," said his dory-mate, turning white enough, "I'll make no bones of it, nor mince nothin', for somebody's got to tell ye, and they said it must be me. There's a warrant after ye. The sheriff's on the tug betwixt us and the wharf. She's layin' off of the island, him aboard of her."

"I never was in prison," faltered Jack. "The boys have always bailed me."

"Tain't a bailin' matter, Jack, this time."

"What did you say?"

"I said it wasn't a bailin' business. Somebody's got to tell you."

Jack gazed confidently up into his friend's face.

"What was it that I done, old boy? Can't ye tell me?"

"Let the sheriff tell you. Ask the sheriff. I'd rather it was the sheriff told you, Jack."

"Tell me what it is I done, Rowe Salt; I'd tell you." He looked puzzled.

"The sheriff knows more about it nor I do," begged the fisherman; "don't make an old messmate tell you."

"All right," said Jack, turning away. He had now grown very quiet. He pleaded no more, only to mutter once:

"I'd rather heard it from a messmate."

Rowe Salt took a step or two, turned, stopped, stirred, and turned again.

"You killed somebody, then, if you will know."

"Killed somebody?"

"Yes."

"I was drunk and killed somebody?"

"Lord help you, yes."

"I hope," hoarsely — "Look here, Salt, I hope Teen won't know."

"I say, Rowe," after a long pause, "who was it that I killed?"

"Ask the sheriff."

"Who was it that I killed?"

"The skipper'll tell you, mebby. I won't.

No, I vow I won't. Let me go. I've done my share of this. Let me up on deck! I want the air!"

"I won't let you up on deck — so help me! — till you tell!"

"Let me off, Jack, let me off!"

"Tell me who it was, I say!"

"Lord in heaven, the poor devil don't know, — he really don't."

"I thought you would ha' told me, Rowe," said Jack with a smile, — his old winning smile, that had captivated his messmates all his life.

"I will tell you!" cried Rowe Salt with an oath of agony. "You killed your wife. You murdered her. She's dead. Teen ain't to home. She's dead."

THEY made way for him at this side and at that, for he sprang up the gangway, and dashed among them. When he saw them all together, and how they looked at him, he stopped. A change seemed to strike his purpose, be it what it might.

"Boys," said Jack, looking all about, "ye won't have to go no bail for me. I'll bide my account, this time."

He parted from them, for they let him do the thing he would, and got himself alone into the bows, and there he sank down, crouching, and no one spoke to him. The *Daredevil* rounded Eastern Point, and down the shining harbor, all sails set, came gayly in. They were almost home.

Straightway there started out upon the winter sea a strong, sweet tenor, like a cry. It was Jack's voice, — everybody knew it. He stood by himself in the bows, back to them, singing like an angel or a madman, — some said this; some said the other, —

"Rock of Ages, cleft for me!

Let me hide myself in thee; . . .

Thou must save, and thou alone. . . .

When I soar to worlds unknown,
See thee on thy judgment throne,"

sang Jack.

With the ceasing of his voice, they divined how it was, by one instinct, and every man sprang to him. But he had leaped and gained on them.

The waters of Fairharbor seemed themselves to leap to greet him as he went down. These that had borne him and ruined him buried him as if they loved him. He had pushed up his sleeves for the spring, hard to the shoulder, like a man who would wrestle at odds.

As he sank, one bared arm thrust above the crest of the long wave, lifted itself toward the sky. It was his right arm, on which the crucifix was stamped.

WHITE and gold as the lips and heart of a lily, the day blossomed at Fairharbor one June Sunday, when these things were as a tale that is told. It was a warm day, sweet and still. There was no wind, no fog. The harbor wore her innocent face. She has one; who can help believing in it, to see it? The waves stretched themselves upon the beach as if they had been hands laid out in benediction; and the colors of the sky were like the expression of a strong and solemn countenance.

So thought Mother Mary, standing by her husband's side that day, and looking off from the little creature in her arms to the faces of the fishermen gathered there about her for the service. It was an open-air service, held upon the beach, where the people she had served and loved could freely come to her—and would. They had sought the scene in large numbers. The summer people, too, strolled down, distant and different, and hung upon the edges of the group. They had a civil welcome, but no more. This was a fisherman's affair; nobody needed them; Mother Mary did not belong to them.

"The meetin's ours," said Rowe Salt. "It's us she's after. The boarders ain't of no account to her."

His brother Jim was there with Rowe, and Jim's wife, and some of the respectable women neighbors. The skipper of the *Daredevil* was there, and so were many of Jack's old messmates. When it was understood that Mother Mary had adopted Jack's baby, the news had run like rising tide, from wharf to wharf, from deck to deck,—everybody knew it, by this time. Almost everybody was there, to see the baptism. The Fairharbor fishermen were alert to the honor of their guild. They turned out in force to explain matters, sensitive to show their best. They would have it understood that one may have one's faults, but one does not, therefore, murder one's wife.

The scene in the annals and the legends of Fairharbor was memorable, and will be long. It was as strange to the seamen as a leaf thrown over from the pages of the Book of Life, inscribed in an unknown tongue of which they only knew that it was the tongue of love. Whether it spoke as of men or of angels, they would have been perplexed to say.

Into her childless life, its poverty, its struggles, its sacrifices, and its blessed hope, Mother Mary's great heart took the baby as she took a man's own better nature for him; that which lay so puny and so orphaned in those wild lives of theirs, an infant in her hands.

Jack's baby, *Jack's* baby and Teen's, as if it had been anybody's else baby, was to be

baptized "like folks." Jack's baby, poor little devil, was to have his chance.

The men talked it over gravely; it affected them with a respect one would not anticipate, who did not know them. They had their Sunday clothes on. They were all clean. They had a quiet look. One fellow who had taken a little too much ventured down upon the beach, but he was hustled away from the christening and ducked in the cove, and hung upon the rocks to dry. One must be sober who helped to baptize that baby.

This was quite understood.

They sang the hymn, Jack's hymn and Teen's: of course they sang the Rock of Ages, and Mother Mary's husband read "the chapter" to them, as he was used, and spoke with them; and it was so still among them that they could hear each wave of the placid sea beat evenly as if they listened to the beating of a near and mighty peaceful heart. Mother Mary spoke with them herself a little. She told them how she took the child, in despair of the past, in hope of the future; in pain and in pity, and in love; yearning over him, and his, and those who were of their inheritance, and fate, their chances, and their sorrows, and their sins. She told them of the child's pure heart within us all, which needs only to be mothered to be saved; which needs only that we foster it, to form it; which needs that we treat it as we do other weak and helpless things, whether in ourselves or in another. What was noble in them all, she said, was to them like this little thing, to her. It was a trust. She gave it to them, so she said, as she took the baby, here before their witnessing, to spare him from their miseries, if she might.

They were touched by this, or they seemed to be; for they listened from their souls.

"We'd oughter take off our hats," somebody whispered. So they stood uncovered before the minister, and Mother Mary; and Jack's poor baby. The sacred drops flashed in the white air. Dreamily the fishermen heard the sacred words:

"In the name of the Father: And of the Son: And of the Holy Ghost. Amen."

But no one heard the other words, said by Mother Mary close and low, when she received the child into her arms again, and bowed her face above it:

"My son, I take thee for the sake and for the love of thy father, and of thy mother. Be thou their holy ghost."

But the fishermen, used not to understand her, but only to her understanding them, perceiving that she was at prayer, they knew not why, asking of Heaven they knew not what, the fishermen said: *Amen. Amen.*

HOW FOOD NOURISHES THE BODY.

THE CHEMISTRY OF FOODS AND NUTRITION. II.

* These problems, which are of such great importance for physiology, for medicine, and for social economy, cannot be solved without untiring patience and very considerable means."—*Voit.*

"Eat to live." The eating of bread and meat is a simple matter, but the ways in which the different constituents of the food perform their offices in the maintenance of life are problems as profound

as any with which physical science has to deal.

The works of nature culminate in man. In his organism her operations are most complex and recondite. The laws which regulate our physical being are discovered but slowly and by the most ingenious and profound research. Those which govern the nutrition of our bodies have been shrouded in mystery which only the investigation of later time has begun to unveil. But, here as elsewhere, the crude and often fantastic theories of the past are being gradually replaced by the more certain knowledge of the present.

In the previous article we noticed the chemical composition of the human body and of the

food by which it is nourished. It appeared that our bodies and our food both are composed of the same chemical elements, and that the compounds of these elements which chemical analysis reveals in the food are likewise very similar to the compounds of which our bodies are composed. This, indeed, we should expect from the very fact that the body is made of the food.

The reproduction below of a chart from the previous article of this series describes the principal constituents of our foods. The proportions of the several ingredients in a number of food-materials are shown in Diagram III. of the previous article.

But the food does more than to furnish the material of which the body is built up. As our tissues, muscle and tendon, bone and brain, are continually worn out with work and thought and worry, it is with the ingredients of food that they are repaired, and it is our food that supplies the fuel by whose consumption the heat and strength of the body are maintained.

INGREDIENTS OF FOOD-MATERIALS.

NUTRIENTS AND NON-NUTRIENTS.

Our ordinary food-materials, such as meat, fish, eggs, potatoes, wheat, etc., consist of:

REFUSE: *E. g.*, the bones of meat and fish, shells of eggs, skin of potatoes, and bran of wheat.

EDIBLE PORTION: *E. g.*, the flesh of meat and fish, whites and yolk of eggs, wheat flour.

The edible substance consists of:

WATER,

NUTRITIVE INGREDIENTS OR NUTRIENTS.

The principal kinds of nutrients are:

1. PROTEIN, 3. CARBOHYDRATES,
2. FATS, 4. MINERAL MATTERS.

The water and refuse are called non-nutrients. The water contained in foods and beverages has the same composition and properties as other water, and it is, of course, indispensable for nourishment, but is not a nutrient in the sense in which the word is here used.

CLASSES OF NUTRIENTS.

The following are familiar examples of compounds of each of the four principal classes of nutrients:

- | | |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROTEIN | $\left\{ \begin{array}{l} a \text{ ALBUMINOIDS: Albumen (white) of eggs; casein (curd) of milk; myosin, the basis of muscle (lean meat); gluten of wheat, etc.} \\ b \text{ GELATINOIDS: Collagen of tendons; ossein of bones; which yield gelatin or glue.} \end{array} \right.$ |
| FATS | $\left\{ \begin{array}{l} E. g., fat of meat; fat (butter) of milk; olive oil; oil of corn, wheat, etc. \end{array} \right.$ |
| CARBOHYDRATES | $\left\{ \begin{array}{l} E. g., sugar, starch, cellulose (woody fiber). \end{array} \right.$ |
| MINERAL MATTERS | $\left\{ \begin{array}{l} E. g., calcium phosphate, or phosphate of lime; sodium chloride (common salt). \end{array} \right.$ |

It is to be especially noted that the protein compounds contain nitrogen, while the fats and carbohydrates have none. Meats and fish contain very small quantities of a class of compounds called "extractives" (the chief ingredients of beef tea and meat extract), which contain nitrogen, and hence are commonly classed with protein. The albuminoids and gelatinoids are sometimes called proteids.

The physiological chemistry of to-day looks upon the body as a sort of machine. Food is the raw material; heat, muscular strength, and other forms of energy are the products. But this does not exactly express the idea; for both the machine and its products come from the transformation of the food, and furthermore, the body is continually consuming not only food but its own substance also, in order to generate heat to keep itself warm, and muscular and intellectual energy to do its own work.

The particular question I wish to speak of now is this: What parts do the several classes of nutrients of food, the protein, fats, carbohydrates, etc., play in the nutrition of the body? Or, to put it in another way, of what constituents of the food are flesh and fat made up, what ones supply us with warmth and muscular strength, and what are the chemical transformations which our nutriment continually undergoes in supplying our bodily wants? These transformations belong to what the physiologists are teaching us to call metabolism. It is a part of this subject of metabolism that we have now to consider.

When we know what are the kinds and amounts of nutritive substances our bodies need and our food-materials contain, then and not till then shall we be able to adjust our diet to the demands of health and purse.

The ways in which the body makes use of its food are found out by experiments made with living animals, with pigeons, geese, rabbits, dogs, sheep, goats, oxen, horses and many others, including men. The experimenting of the last few years, particularly, has been very extensive, and has brought extremely important results. To give a brief account of some of these researches and their principal results as applied to the nutrition of man is the object of this article. Will the reader first permit a few technical statements which seem necessary by way of introduction?

If we could follow the course of a molecule of the protein of the meat we eat from the time when, after being digested, it is taken into the blood, and carried and stored in the arm as muscle and afterwards consumed; if we were gifted with vision acute enough to trace the journeyings and transformations of a particle of the fat of the same meat or of the starch of the bread eaten with it, until it is deposited as fat in the muscle or in adipose tissue, or is disintegrated and united with the oxygen of the inhaled air, yielding warmth or strength, the answer to our questions as to how the different nutrients do their work might be made very plain. But vitally important as these processes are, near as they are to us, parts as they are of us, they have been almost entirely beyond our ken until late experimental re-

search has found a practicable way for learning about them. This way of finding how food is used consists in the comparison of the income with the outgo of the body.

The body creates nothing for itself, either of material or energy; all must come to it from without. Every atom of carbon, hydrogen, phosphorus, or other elements; every molecule of protein, carbohydrates or other compounds of these elements, is brought to the body with the food and drink it consumes and the air it breathes. Like the steam-engine, it simply uses the material supplied to it. Its chemical compounds and its energy are the compounds and the energy of the food transformed.

The science of nutrition as it is taught to-day has this marked peculiarity, that it is a matter of definite quantities of income and expenditure, measured in terms of chemical elements and compounds, and of heat and mechanical energy. It is based upon a kind of chemical book-keeping, and the accuracy of its teaching is, in a certain sense, proportional to the accuracy with which the accounts are kept. The items of the account are obtained from experiments with living organisms, with animals fed upon different food-materials, under circumstances and with appliances which render feasible the accurate measurement of income and outgo.

DAILY INCOME AND EXPENDITURE OF THE BODY.—METABOLISM.

Food, drink, and oxygen of inhaled air constitute the income of the body. Part of this material is transformed into blood, muscle, fat, bone, and other tissues. The rest, together with the materials worn out with use, undergo still further chemical transformations. The compounds thus formed are finally given off from the body and constitute its outgo, or expenditure of material.

A small part of the food passes through the alimentary canal undigested and is excreted by the intestine. The larger part is digested, taken into the blood, and distributed through the body. Some of it is used to build up tissues, as in the case of the growing child; some is used to repair the tissues that are being continually disintegrated; but ultimately the oxygen brought from the air through the lungs unites with the carbon and hydrogen of the food or of the tissues consumed, forming carbonic acid and water, while the nitrogen with part of the carbon and hydrogen forms urea and similar products. The urea and allied compounds escape by way of the kidneys, the carbonic acid is given off by the lungs and skin, and the water by the lungs, skin, and

kidneys. So, since tissues are made up of the food, practically all of the digested protein, fats, and carbohydrates finally leave the body as urea, carbonic acid, and water.

Let us take, for instance, the case of an ordinary man, say a mechanic or a day-laborer, doing a fair amount of manual work. Let us suppose him to have a diet of beefsteak, bread, potatoes, butter, and water. To simplify the calculations, we will leave out the tea, coffee, salt, etc., and take enough of the bread and potatoes to make up for the milk, sugar, and other materials which he would ordinarily consume. Such quantities as the following would supply the necessary nutrients for a day:

Beefsteak (lean and free from bone)	8 ounces.
Bread	20 "
Potatoes	30 "
Butter	1 "
Water	37 "

Total food and drink (6 pounds) 96 ounces.

With these six pounds of food and drink he would consume about 30 ounces of oxygen from the air inhaled during the twenty-four hours, making a total income not far from 126 ounces, or 7½ pounds.

But in our chemical balancing of income and expenditure the calculations are made, not in terms of meat and bread and butter, but of protein, fats, carbohydrates, etc. It may be drawn up as below: I give weights in grams as well as in ounces, since we shall find the grams convenient in subsequent calculations.

The experiments I am about to describe are based upon the principle involved in this supposed case. A large number of most important ones have been performed in Germany, in nu-

merous agricultural experiment stations with animals and, in Munich, with men as well.

EXPERIMENTS FOR STUDYING THE LAWS OF NUTRITION.

THE hurried visitor in Munich, after seeing the treasures of painting and sculpture in the Old and the New Pinakothek and the Glyptothek, is apt to drive to the statue of Bavaria, outside the town. In doing so he will very likely pass a house—it is a square, gray, and somewhat gloomy building just across the street from the Crystal Palace—which to the chemist, the physiologist, the agriculturist, and the student of political and social science is of no little interest, for here lived and labored for many years the great philosopher Liebig, who is, more than any other man, the father of the science we are studying. Going on across the Marien Platz with its quaint Renaissance buildings and out through the Sendlinger gate, he passes along the Findling Strasse. On the right, just beyond the gate, is a brick building which the artistic traveler will not be apt to notice, but which to those interested in our present subject is full of attraction. It is the Physiological Institute of the university. In it are the laboratory and respiration apparatus where Pettenkofer, Voit, and others have conducted some of the most important researches in this department of science. If the reader wished to see how some of the facts of modern science are found out, I should hardly know of a more interesting place to which to take him than this.

Coming in through the hallway, we have, on the right, the apartments of the *Hausmeister*, who is at once the chief janitor and the mechanic of the establishment, and on the left,

ASSUMED DAILY INCOME AND EXPENDITURE OF THE BODY OF AN AVERAGE MAN DOING A MODERATE AMOUNT OF MUSCULAR LABOR.

rooms for the assistants and for some of the laboratory work, while a stairway leads to the lecture and apparatus rooms above. A door in front opens into the main working-room, which is fitted up like an ordinary chemical laboratory. At different desks assistants and students are at work, and we perhaps see the burly form of the *Diener*, the laboratory servant, with whom a large number of experiments have been made.

At the left is a room supplied with a number of curious-looking cages. In one may be a dog, in another a goose, and in a third a number of rats, all being used for feeding-trials of one kind or another. In the rear are the balance-room, the study of Professor Voit, director of the establishment, and, what is most interesting of all to us, the respiration apparatus.

Before explaining the respiration experiments, which are somewhat complicated, let me describe a simpler experiment, taking one actually made to study the effect of protein in the form of lean meat, *i. e.*, muscle.

The question was this: From a given quantity of the protein of muscular tissue, how much will be digested by a healthy man, and will the quantity digested suffice to maintain the supply of protein in his body? In other words, will the man gain or lose protein, or will he simply hold his own on this diet?

The subject was a medical student. The experiment lasted three days. For protein he ate very lean beefsteak. This contained, along with the protein, a little fat (the fat was trimmed out as carefully as practicable, but nevertheless minute particles remained about and within the muscular fibers of the meat), and mineral matters, besides, of course, considerable water. The diet consisted of the beefsteak cooked with butter, seasoned with pepper, salt, and Worcestershire sauce, and taken with water, beer, and wine.

Leaving the other materials out of account, as they did not essentially affect the results, the food contained 1200 grams, about 2 pounds 10 ounces, of the lean meat, and 30 grams, or a little over an ounce, of butter per day. The total quantity of nitrogen in the food was about 38 grams daily, of which over 37 grams were digested. It is mainly upon this nitrogen that the experiment hinges.

One of the hard-fought questions of physiological chemistry has been whether or not all of the nitrogen given off from the body (aside from that which is undigested) is excreted by the kidneys. But it is now pretty well settled that this is the only way by which any considerable quantity leaves the body. If then we know how much nitrogen is digested and taken into the circulation and how much is withdrawn in this way, we have an easy

means of determining whether the stock of nitrogen in the body is gaining or losing. If I put more money in the bank than I draw out, my balance on the books shows an increased amount to my credit; but if I take out more than I put in, my deposit grows smaller. In like manner the balance of income and outgo of nitrogen shows whether the body is gaining or losing nitrogen.

Now for this purpose we may regard the compounds of the body, exclusive of water and mineral matters, as belonging to two classes — protein compounds and fats. And numerous as the protein compounds are, the proportion of nitrogen is nearly the same in all, and we may take the protein of muscle as representing the whole class. For every gram of nitrogen there will be just about $6\frac{1}{4}$ grams of protein, and for every gram of protein there will be about $4\frac{1}{3}$ grams of muscle, tendon, and the like in meat. Accordingly, for every gram of nitrogen there will be ($6\frac{1}{4} \times 4\frac{1}{3}$) about 27 grams of muscle, exclusive of fat.

The question, then, may be put thus: On the diet of 2 pounds and 10 ounces of lean meat and an ounce of butter per day, was the store of protein in this man's body increased or decreased? In other words, so far as muscular tissue was concerned did he gain or lose or hold his own? Here are the figures:

INCOME AND OUTGO OF DIGESTED NITROGEN IN EXPERIMENT WITH A MAN ON DIET OF LEAN MEAT.

Total nitrogen.....	per day	38.5 grams.
Nitrogen.....	kidneys " "	37.2 "
Balance, stored in the body " "		1.3 grams.

That is to say, this young, vigorous man, a student, at his ordinary occupations, studying in his room, listening to lectures at the university, working several hours each day in the laboratory, walking a little for exercise, and living on a diet of protein with a very little fat, gained nitrogen at the rate of 1.3 grams per day. These 1.3 grams of nitrogen represented about 8.2 grams of protein or 35 grams ($1\frac{1}{4}$ ounces) of muscle gained per day during the three days of the experiment. In other words, so far as the lean flesh in his body was concerned he just a little more than held his own.

But what about the fat of his body — did he gain or lose? Did the protein and fat of the meat and butter suffice still further to supply him with heat and muscular energy, or did he consume some of the fat previously stored in his body?

The only way to answer the question is to measure exactly all of the income and the outgo of the body — the food and drink on the

PHYSIOLOGICAL INSTITUTE, MUNICH.

one hand, and on the other, all of the products excreted, solid, liquid, and gaseous. This involves measuring and analyzing each one of the materials which made up the food and drink, and at the same time all of the products excreted by the intestines, kidneys, lungs, and skin. In brief, we must, with the rest, measure the compounds given off as vapor or gas. With them, the account of income and outgo will be complete.

But this means that we must measure and analyze the inhaled and exhaled air.

THE RESPIRATION APPARATUS.

THE respiration apparatus is a device for measuring the respiratory products. Many forms have been devised, from one in which the products of respiration of a piece of muscle taken from a just-killed animal can be measured, the respiratory process being maintained by artificial circulation of blood through the muscle, to one in which an ox may be kept for days or weeks, and the composition of the inhaled and exhaled air likewise determined.

A very interesting form is that used by the French experimenters, Regnault and Reiset. This is a small chamber of glass, inside of which the animal is placed, some rather complicated appliances being used to continually renew the supply of oxygen and remove the carbonic acid and other products of respiration. But from insufficient ventilation and other minor difficulties, this form of apparatus has not quite sufficed for satisfactory experiments, especially with the larger animals and with man.

By far the most satisfactory apparatus is that invented by Professor Pettenkofer of Munich. This, to my notion, is one of the most interesting devices of modern experi-

PROFESSOR PETTENKOFER.

FROM A PHOTOGRAPH BY E. W. HALL.

PETTENKOFEK'S RESPIRATION APPARATUS.

mental science. The first one was built through the munificence of the King of Bavaria.

The peculiar features of this apparatus are that the subject of experiment, be it a dog, an ox, or a man, is in a comfortable, well-ventilated room, and that the air, which passes through it in a continuous current, is measured and is analyzed both before it goes in and after it comes out. We can thus tell just what the animal has added to it, in other words, what material has been given off as gas or vapor from the body. The arrangements do not provide for estimating all the respiratory products with absolute exactness, but they suffice for reasonably accurate results. The form used for experiments with man consists of a chamber — a *salon*, it is called; as a matter of fact it is an iron box — through which a cur-

rent of air is drawn by a large pump, the latter being worked by an engine.

The *salon* of the large apparatus at Munich is made of plates of iron, similar to boiler-iron, and is in the form of a cube about eight feet each way. It has glass windows, and a door large enough to admit a man. The large engraving herewith shows the apparatus as it is now arranged. On the left is the chamber in which the man under experiment stays; near are a table holding apparatus for analyzing the air before and after it passes through the chamber, and a large meter for measuring the quantity of air which passes through. In an adjoining room is the machinery by which the current of air is pumped through the apparatus. The smaller sketch explains the working in more detail. The air enters the chamber at its left side and passes out on the right

through the large pipe P P, into the large meter M, in which it is measured. A small tube, t t, takes from the pipe P P a portion of the air which has been passed through the chamber and contains the products of respiration into two small meters, m m, where it is measured, and through the apparatus on the table T, where it is analyzed. A similar small tube, t' t', brings air for analysis from the outside of the apparatus, taking it from the left of the chamber

DETAIL DRAWING OF ABOVE.

where it enters the latter and carrying it into two other small meters (not shown in this sketch), where it is measured, and through apparatus, also not shown here, by which it is analyzed. In the larger engraving the four small meters and apparatus for analyzing the air are shown on the table between the chamber and the large meter. Comparisons of the quantity and composition of the air which has passed through the chamber with the outside air show what the man has imparted to the air in breathing, and thus tell the amounts of the products of respiration. The food and drink and the solid and the liquid products of its consumption in the body are at the same time measured, weighed, and analyzed, and thus all of the items of income and outgo of the body are determined.

The first man to enter the respiration apparatus for experiments upon himself, I believe, was Professor Ranke of Munich, who has described his experiences in his book on "The Nutrition of Man" ("Die Ernährung des Menschen"), as well as in special memoirs. He tells us that in trials in which he took no food the fasting was somewhat disagreeable, but far less painful than many would think. "I found myself at the end of the first 24 hours entirely well; at the end of the second 24 hours without food or drink, during which sleep had been disturbed, the head was somewhat heavy and there was an oppressiveness in the stomach and considerable weakness; but the sensation of hunger, . . . which was strongest about 30 hours after the last food was taken, . . . did not appear any more."

In the greater number of Professor Ranke's experiments he took a reasonable amount of food. The diet was simple, and consisted of such materials as lean meat, bread, white of egg, starch, sugar, butter, etc., and was found to serve the purpose very well. After some experience a ration was arranged which corresponded very well in composition with that used by ordinary working people, and was at the same time not at all unacceptable. When a number of experiments with Professor Ranke had been completed, several series were made with other persons. One of these latter series I will briefly describe.

The subject was a strong, healthy mechanic, a watchmaker, 28 years old and weighing about 156 pounds. Three experiments were made, each occupying 24 hours. In the first,

the man took nothing but a little meat extract, salt, and water, and did no work. In the second, he had a liberal allowance of palatable food, but still remained at rest. In the third, he had the same diet as in the second, but worked hard at turning a lathe for nine hours, so that he was thoroughly tired at night. During the daytime of the first two experiments, I should say, he read, cleaned a

PROFESSOR VOIT. (FROM A PHOTOGRAPH BY F. MULLER.)

watch, and otherwise occupied himself to while away the time, making, however, very little muscular effort.

The three experiments, then, show the effects of fasting and rest, food and rest, and food and muscular exercise upon the income and outgo of this man's body. We will note only very briefly some of the details of the experiments, the full accounts of which fill many pages.

The diet of the first experiment consisted of:

Meat extract, 12.5 grams (a little less than one-half ounce).

Salt, 15.1 grams (a little over one-half ounce).

Water, 1027.2 grams (about a quart).

The day's ration of the second trial included a third of a pound of lean meat, a pound of bread, a little over a pint of milk, and about a quart of beer, and other materials as follows:

DAY'S FOOD IN SECOND EXPERIMENT.

Meat, lean beef.....	140 grams.
Egg albumen (white of egg)	42 "
Bread.....	450 "
Milk.....	500 "
Beer.....	1025 "
Lard.....	70 "
Butter.....	30 "
Starch.....	70 "
Sugar.....	17 "
Salt.....	4 "
Water.....	286 "

The diet of the third experiment was essentially the same as that of the second, except that the man drank a little more water.

The income included, besides the food and drink, the oxygen consumed from the inhaled air. The estimated quantities were :

Oxygen used in 24 Hours.

- First experiment, fasting and at rest,
779 grams.
Second experiment, liberal ration
and at rest, 709 grams.
Third experiment, liberal ration
and at work, 1006 grams.

The final balance-sheets of the experiments, which show the details of income and outgo in terms of the chemical elements, carbon, nitrogen, etc., are too extensive to be reported here. That for each experiment would nearly fill one of these pages, but as some readers may be curious to see what they are, I give the principal data in abbreviated form.*

DAILY INCOME AND EXPENDITURE OF CHEMICAL ELEMENTS.

	Carbon.	Hydrogen.	Nitrogen.	Oxygen.
	Grams.	Grams.	Grams.	Grams.
Experiment with no food (except meat extract) and no work:				
Income.....	2.4	115.1	1.2	1698.4

PROFESSOR MOLESCHOTT. (FROM A PHOTOGRAPH BY C. LE LIEURE.)

But we wish to know what quantities of flesh and fat the man gained or lost under these different conditions of food and fasting, labor and rest. The figures just cited are for the chemical elements of which the protein and fats are composed. Knowing the propor-

* The accuracy of these experiments has been occasionally called in question, especially on the ground that with the possible sources of error, so complete an accuracy in the balance-sheet is in itself suspicious.

That some of the chemical work involved in the researches of which these form a part might have been performed by more nearly perfect methods is doubtless true, but I believe that experience in the Munich laboratory and careful examination of the published details of the researches must convince the most exacting physiological chemist that such criticisms are without foundation. As regards the chief subject of criticism, which is connected with the question of "nitrogen balance," it will suffice to say that the tendency of the latest investigations has been to very decidedly confirm the correctness of the assumption on which the Munich results are based, *i. e.*, that practically all the digested nitrogen is excreted by the kidneys. And certainly all the men I have known among those who have worked in the Munich laboratory regard the complete accuracy above alluded to as the result of careful and thoroughly reliable work.

tions of the elements in each compound, it is easy, from the figures for the elements, to estimate the quantities of the compounds. Omitting details of the calculations* the results are given in the balance sheet of compounds herewith. Regarding the carbohydrates, however, I should explain that since the body has extremely little of its own, and those of the food are consumed, they are left out of account in the experiment without food, and the amounts received and consumed in the experiments with food are taken as balancing one another.

work, with the same amount of food, he likewise held his own so far as lean flesh was concerned, but lost two ounces of fat. The body used for its support protein and fats, in each case, and carbohydrates when it had them. When the nutrients were not supplied in food, it consumed a little protein and a good deal more fat from its own store. With a ration which sufficed to exactly maintain its protein without gain or loss, the body gained fat when it had only a little more than its own muscular work to perform (that in-

The protein gained or lost was mainly from the muscles and similar tissues, or what we may call flesh as distinguished from fat. Taking the figures for protein and fats gained and lost as shown in the last line of the balance-sheet of income and expenditure of compounds, changing grams to ounces, and assuming that with each ounce of protein would be water, etc., enough to make the equivalent of $4\frac{1}{3}$ ounces of lean flesh, *i. e.*, muscle, tendon, etc., we have this final result of the trials; the quantities, as before, are those gained or lost in one day:

OUTCOME OF THE EXPERIMENTS AS REGARDS INCREASE OR DECREASE OF LEAN FLESH AND FAT WITHIN THE BODY.

	Lean flesh (muscle, etc.).	Fats.
No food, no work, loss	11 ounces	$7\frac{2}{3}$ ounces
Liberal diet, no work, gain	none	$2\frac{1}{3}$ "
Liberal diet, hard work, loss	none	2 "

That is to say, fasting, and without muscular labor, the man lived upon the tissues of his body, and consumed daily a trifle less than three-quarters of a pound of muscle, and with this nearly half a pound of the fat previously stored in his body. With plenty of food, and still resting, he neither gained nor lost lean flesh, but gained $2\frac{1}{3}$ ounces of fat in a day. And when he set himself to hard muscular

work, with the same amount of food, he likewise held his own so far as lean flesh was concerned, but lost two ounces of fat.

If we had only these experiments to judge from, we might infer that muscular energy comes from consumption of fat, and that the special work of the protein of the food is to repair the wastes and make up for the wear and tear of the protein of the body; and this would be true as far as it goes. But, of course, many other experiments and of many different kinds are needed to settle these questions. The majority of the most useful ones, thus far, have been made with other animals than man. For experiments with dogs, geese, and other small animals a small respiration apparatus on the plan of Professor Pettenkofer's has been devised by Professor Voit.

In studying the laws of animal nutrition the most convenient organism, for many purposes, is that of the dog. The dog thrives upon both animal and vegetable foods, utilizes large quantities of food to advantage or endures long fasting with patience, and makes ready responses by changes of bodily condition to changes in the food. In reading the accounts of the famous feeding-trials conducted by Bischoff and Voit, one is surprised to see what control they obtained of the organisms of the dogs experimented with. By altering the kinds and quantities of food constituents, Voit was able either to reduce both the flesh (protein) and the fat of the animal's body or to increase

* The calculations, based upon accepted principles of physiological chemistry, are too complex for this place. They are to be explained in detail in a book on

this general subject now in preparation. Students may find them in the original (German) memoirs in which the experiments are described.

both flesh and fat, or to reduce the one or to increase the other. Indeed, the manipulations effected in this way seemed almost equivalent to getting into the tissues and directly removing or adding flesh, or fat, at will. The principles thus learned from experiments with the dog and other animals apply in the main, though not in all the details, to the nutrition of man.

But I must beware of burdening the reader with details, a danger he will appreciate when I say that the experiments of the last twenty years are numbered by hundreds and even thousands, and that the literature of the subject is so voluminous that few specialists even are able to handle it. I will endeavor to very briefly summarize a few of the main results. I do not know how to do this better than in the following chart, which was prepared for the Food Collection of the National Museum.

USES OF FOOD IN THE BODY.

Food supplies the wants of the body in several ways.

Food furnishes :

1. The material of which the body is made.
2. The material to repair the wastes of the body, and to protect its tissues from being unduly consumed.

Food is consumed as fuel in the body to :

3. Produce heat to keep it warm.
4. Produce muscular and intellectual energy for the work it has to do.

The body is built up and its wastes are repaired by the nutrients. The nutrients also serve as fuel to warm the body and supply it with strength.

WAYS IN WHICH THE NUTRIENTS ARE USED IN THE BODY.

The Protein of food { forms the nitrogenous basis of blood, muscle, sinew, bone, skin, etc.
is changed into fats and carbohydrates.
is consumed for fuel.

The Fats of food { are stored in the body as fat.
are consumed for fuel.

The Carbohydrates of food { are changed into fat.
are consumed for fuel.

The Mineral matters of food { are transformed into the mineral matters of bone and other tissues.
are used in various other ways.

Like all attempts to tell a long story in a few words, it omits many important details and gives incomplete expression to the facts which it states. Thus, regarding the use of the nutrients as "fuel," although their elements combine with oxygen as those of the coal and wood do in the stove, the process, as it actually goes on in the body, is far more complex and less completely understood. In saying

that food yields muscular and intellectual energy the statements do not explain how this is done, nor has science yet given an at all complete explanation of these wonderful phenomena. Nor do these statements include the important fact that the fats, protein, and other substances stored in the body are used like those of the food. But the chart includes what it is most important for our present purpose to remember, and we shall have occasion to make further explanations in another place.

Translating the statements of this chart into ordinary language, it means that, when we eat meat and bread and potatoes and other kinds of food, our bodies use the nutritive ingredients in different ways. Thus the myosin, which is the principal nutritive ingredient of muscle (lean meat), the casein (curd) of milk, the albumen (white) of egg, and the gluten of bread are all albuminoids or protein compounds, and are transformed into muscle, tendon, and other nitrogenous materials in our bodies. The protein compounds are sometimes called flesh-formers, which is all very well so far as it goes, but does not go far enough. They, and they alone, form flesh (*i. e.*, nitrogenous tissue), it is true, but they do a good deal more. They are also transformed into fat and carbohydrates in our bodies, and they are consumed as fuel to yield us heat and muscular strength.

But our meat always contains more or less fat. This may be taken up by the body and stored as fat within the muscle, bone, and adipose or other tissues, and so retained for a time as a part of the body-fat; but the bulk of the fat of the food serves as fuel, and that which has been stored in the body is consumed for the same purpose when occasion demands. Thus the man in the experiments above described lived on the fat previously stored in his body when he took no food; laid up fat when he had a liberal ration and did no work; and drew upon the accumulated store again when he did hard muscular work with the same ration. The fat of milk, of butter, and of the fatty and oily materials in bread, corn meal, and other foods is like that of meat, stored as body-fat and used for fuel.

Vegetable foods, such as flour, meal, potatoes, and the like, contain a great deal of starch, sugar, and other carbohydrates. When these are taken into the body they are to some extent converted into fats, but their main use seems to be to serve for fuel. In serving as fuel the carbohydrates protect the fats and protein from being consumed. In like manner the fats may protect protein from consumption.

In short, the nitrogenous compounds of muscle, tendon, bone, and other parts of the framework of the body and of the blood are

made of the protein of the food. We get the fat of our bodies not only from the fats but from the protein, and probably from the carbohydrates, starch, sugar, etc., of our food. Other animals, dogs, sheep, swine, and geese, transform carbohydrates into fats, and there is every reason to believe that man is endowed with the same faculty. We use all these classes of nutrients, protein, fats, and carbohydrates, as sources of warmth and muscular strength. Our bodies, when they are in a healthy condition, contain a reserve of protein and fat which is drawn upon if food is lacking, or if there is extra muscular work to be done or extra cold to be endured. And whether the food supply is rightly adapted to the demands of the body or not, its tissues are continually consumed to supply its wants and are as constantly rebuilt from the food. The old notion that the whole body is made over once in seven years is wrong, however. Some parts are used up and renewed very rapidly, others very slowly. Such, at any rate, are the teachings of the most careful research as they are understood by the investigators who seem best qualified to judge.

ADAPTATION OF THE DIET TO THE DEMANDS OF THE BODY.

THE further details of the ways in which food is used in nutrition will naturally come in with the explanations in succeeding articles. But there are one or two more points which perhaps I ought to speak of now. One is, that the body requires a proper supply of each of the different kinds of nutrients for healthful nourishment. The proper supply of neither can be cut off without injury.

The protein can, to be sure, do some of the work of the fats and the carbohydrates. In the lack of plenty of vegetable food to furnish starch and sugar, for instance, we may get on pretty well for a while with meat, which has no carbohydrates, the protein and fat of the meat taking their place as fuel. The Laplanders and Esquimaux have extremely little vegetable food and consume enormous quantities of meat, and especially of fat meat, blubber, and what not. But their diet is hardly adapted to either the wants or the digestive apparatus of people of temperate climates. Ordinary people need considerable carbohydrates, and no amount of protein can fully supply their place.

But while the protein can to some extent serve in place of the carbohydrates and fats, these latter cannot replace the protein. The Esquimaux can live on meat, but neither men nor other animals can long thrive upon a diet of fat, or sugar, or starch without protein. The reason is that protein has a kind of work to do in building up the muscle, tendon, and

other tissues which the fats and carbohydrates cannot perform. Hence, we must have a certain amount of protein in our food or our bodies will suffer for the lack of it, and the more work there is to do, the greater the wear and tear of muscle and tendon, the more liberal must be the supply of protein as well as of other nutrients.

The effect of one-sided diet is very well illustrated in some experiments by Professor Ranke. They were made in the respiration apparatus at Munich, and belonged to the series of which I have already spoken. After he had studied the changes that went on in his body when fasting, he proposed to himself these questions:

What will be the effect of a diet of protein with very little fat and no carbohydrates on the one hand, and of a diet of fats and carbohydrates without protein on the other? In other words, how will the composition of the body be affected by food rich in protein and containing little else, and how will the store of fat and protein be altered by leaving the protein out of the food and living on the other nutrients?

For the diet of protein, he took lean meat, with butter and a little salt, essentially the same diet as was used by the student in the experiment described above. He had found himself able to eat 2000 grams of the lean meat in the course of the day, but in this experiment, which lasted 24 hours, he ate only 1833 grams (about 4 pounds) of meat and with it 70 grams of fat, 30 grams of salt, and 3371 grams (nearly 3 quarts) of water. Without going into the details, suffice it to say, that, according to Professor Ranke's calculations, his body lost 15.1 grams of fat and at the same time gained 113 grams of protein during the day of the experiment. In the other experiment, which likewise continued for 24 hours, the food consisted of 150 grams of fat, 300 grams of starch, and 100 grams of sugar, an even less appetizing mixture perhaps than the lean meat and butter for an exclusive diet, but yet one which, if put together with proper culinary skill, makes a cake that can be swallowed. This time he lost 51 grams of protein and gained 91.5 grams of fat.

The results of these two experiments may be recapitulated thus:

On the diet consisting chiefly of	The body
Protein (lean meat, etc.),	gained protein (muscle, etc.) and lost fat.
Fats and carbohydrates (starch and sugar),	lost protein and gained fat.

This is just what we might expect. But it is interesting to have the facts and figures to

show exactly what did take place, and other experiments make it safe to say that if either the quantities of food or the condition of Professor Ranke's body had been different, the results would have been different also. Thus in the first experiment if he had eaten less meat he would have stored less protein; indeed, with a small enough ration he would have lost both protein and fat, and it seems probable that if he had not been a rather fat person he would not have lost fat so readily on the protein diet.

Experiments confirm and to some extent explain the fact so well attested by general experience, that a mixed diet is best for ordinary people in health. Professor Ranke found that when he did no muscular labor, his body neither gained nor lost; that, in other words, he just about "held his own" with food, containing per day:

<i>Protein.</i>	<i>Fats.</i>	<i>Carbohydrates.</i>
100 grams (3.5 oz.)	100 grams	240 grams (8.5 oz.)

Professor Voit estimates as a fair allowance for a laboring-man doing a moderate amount of muscular work:

<i>Protein.</i>	<i>Fats.</i>	<i>Carbohydrates.</i>
118 grams (4.2 oz.)	56 grams (2 oz.)	500 grams (17.6 oz.)

For reasons to be given later, I think that to fairly meet the demand of the average American laboring-man (I mean the man whose labor is done with his muscles; brain-workers who have little muscular exercise need less food, I suppose) a more liberal allowance than Voit makes for laboring-men in Germany is needed. The American "working-man" is better paid, has more and better food, and does more work than his European brother. I should be inclined to quantities more like the following for the nutrients in the daily food of an average man doing manual work:

	<i>Protein.</i>	<i>Fats.</i>	<i>Carbohydrates.</i>
For moderate work	125 grs. (4.4 oz.)	125 grs.	400 grs. (14.4 oz.)
For hard work	150 grs. (5.2 oz.)	150 grs.	400 grs.

Men at very severe work may often need much more than the most liberal of these rations allows, while men, and especially women, of sedentary habits and elderly people are believed to usually require considerably less than the smallest figures indicate.

Statistics collected in the United States imply that the quantity of food consumed by many people whose occupations involve only light muscular labor approaches very near to the largest of these standards, and often considerably exceeds it. Indeed, a large array of facts lately gathered very strongly support the teaching of physicians that the failure to fit the food to the demands of the body, and especially the excessive consumption of cer-

tain kinds of food, are the sources of untold injury to health and happiness. But I am getting ahead of my subject.

THE COST AND VALUE OF ABSTRACT RESEARCH.

ONE can hardly realize, until he has found out by personal experience, the amount of labor, care, and patience, as well as learning and skill, that are required for such investigations as these I have described.

Professor Voit tells us that he has often worked with a servant three or four hours each day during an experiment in simply preparing the meat to be used for the food, in freeing it from fat and connective tissues so as to have as nearly pure protein as possible. In describing a series of experiments he says, "We give only the more important observations, in order to enable the reader to judge of the correctness of our conclusions, and omit the details of the analyses, which would swell the article too much." The article fills 115 royal octavo pages and is only one of scores by this one experimenter and his immediate associates.

At the agricultural experiment station at Weende, Germany, where the celebrated feeding-trials by Henneberg, Stohmann, and others with domestic animals were conducted, one of the assistants once told me a bit of experience with the respiration apparatus. As the result of a long series of observations, it appeared that something was out of order. What the trouble was Professor Henneberg could not find out. One day he happened to hear some one speak of the loss of weight of coal when exposed to the air. It occurred to him that a little coal-tar or some similar material, I have forgotten exactly what it was, had been used in the interior of the apparatus, and that perhaps this, like coal, might undergo such chemical changes as to develop gases and cause the trouble. This proved to be the case. The gentleman who related the incident added, "We have been at work now six years with the respiration apparatus and think we have just got where we can obtain satisfactory results with it." There is a popular idea that the results of scientific discovery, at least such as are most useful to people at large, can be turned out like pig-iron or cotton cloth,—so much in a given time, and with no great labor. Nothing could be more contrary to the facts.

To many people, a large part of the research made in the lines of which I have been speaking would appear so abstract and theoretical as to have but very little "practical" use. But as a matter of fact, the very things that seem most abstruse are of fundamental importance in the solution of the weightiest

problems of chemistry, physiology, hygiene, and social science. In this practical, pushing country of ours, especially, the idea is current that the profoundest studies, whether in physical science or in other departments of human knowledge, are very appropriate and ornamental for philosophers and for institutions devoted to abstract research, but not of much account for ordinary use. Coupled with this is the notion that our higher educational institutions should be places for the teaching of things already known, and that it is not particularly necessary for them to engage in the discovery of new truth. The more rapidly these impressions are done away with, and the more generally and generously abstract research in all departments of knowledge is cultivated, the better it will be for our thought and for our morals, and the sooner shall we get the information that will most help common folks in the ordinary struggles of daily life.

Is it not a significant fact that when we come to the study of even so preëminently plain and practical a subject as the food question, one which affects as many people, and affects them as seriously in health and purse if not in morals, as any of the great problems that are agitating the thought of the time, we must seek the fundamental data of our studies in the learned and profound research of foreign universities?

THE SOURCES OF INTELLECTUAL ENERGY.— PHOSPHORUS AND THOUGHT.—FISH AS BRAIN-FOOD.

THAT the labor of the brain is just as dependent upon food and the substances formed from it in the body as the labor of the hands, there is hardly room for doubt, but just what chemical elements or compounds, if any, are more concerned than others in mental or nervous exercise is a problem yet unsolved.

A great many people have the idea that thought is especially dependent upon phosphorus, and coupled with this is the widespread belief that the flesh of fish is particularly rich in phosphorus, and is hence especially valuable for brain-food.

The theory that connects thought with phosphorus more than with other elements appears to rest upon the fact that certain compounds, *protagon*, *lecithin*, etc., which contain phosphorus and are called phosphorized fats, are more abundant in the brain and nerves than in other parts of the body. From this it has been inferred that mental effort and nervous excitement involve the using up of large amounts of these substances, and that hence phosphorus compounds ought to be especially good for people who have much intel-

lectual work to do or are subject to great nervous strain. In support of this it has been claimed that brain-work increases the amount of phosphorus used up in the body and given off by it, just as muscular work increases the quantity of carbon burned and excreted.

But the compounds that make up the brain and nerves consist of the same elements as those in other organs, though the proportions are different; the phosphorized fats occur in other parts of the body as well as in the brain; *cerebrin*, a compound especially characteristic of the brain, contains no phosphorus; and the most careful experimenting has thus far failed to establish any definite connection between the amounts of intellectual work done and phosphorus excreted.

The value of phosphorus as food for the brain and nerves is frequently and strongly advocated in advertisements of medicines and medicinal foods containing it, and these are largely prescribed by the most eminent members of the medical profession, whose wisdom in so doing I by no means presume to question. But the theory that phosphorus has more to do, or is more necessary than carbon or nitrogen or other elements, in the production of intellectual energy is one to which I have never heard a physiological chemist of repute express his adherence, and in the writings of the experimental physiologists whose opinions are most valued by their fellow-specialists it is conspicuous by its absence.

The history of the theories of the connection between phosphorus and thought and of the value of fish as food for the brain has some rather curious phases.

Few utterances of modern writers have had such a world-wide currency as the expression, "*Ohne Phosphor kein Gedanke*" ("Without phosphorus, no thought"). One meets it everywhere and with it the notion, though generally in very crude form, that thought is somehow produced by phosphorus. A German gentleman of great intelligence told me he had often seen people who supposed that thought was accompanied by something in the brain akin to phosphorescence, like the glow of a phosphorus match in the dark. I have been led to think that the phrase has done more than anything else to spread the idea, though the idea could hardly have become so prevalent if there were not something to nourish it. What that something is I do not know, unless it be the natural query in every mind which the theory seems to answer. The expression has been attributed to various authors. An article in the last edition of the "*Encyclopedia Britannica*" credits it to Büchner. It is due, I believe, to Moleschott, and occurs in his "*Lehre der Nahrungsmittel*" ("Doctrine of Foods").

Of the early leaders of the movement which is sometimes called Materialism and which has so greatly influenced the thought of our time, Moleschott, Vogt, and Büchner were among the most prominent. Forty years or so ago, Moleschott was a *privat docent*—tutor, we should call it—in the University of Heidelberg, and an aspirant for higher academical honors. He was a man of ability as an investigator and writer. His genius was manifested in a controversy with Liebig in which he gained no little repute, and in other writings in which his views were set forth not only with remarkable force, but in a way which was particularly irritating to the metaphysicians and especially to the theologians of the more orthodox way of thinking. Heidelberg at that time was not so liberal in its theology as it has since become, and — I give the account as it was given me by one of the professors now there — young Moleschott's heterodoxy sufficed to deprive him of the liberty of teaching in the university and, as a not unnatural consequence, obtained for him a call to a professorship in another university, that of Zurich in Switzerland. In course of time he was called to Italy, where, as Professor of Physiology in the University of Turin, and later in the University of Rome, he has achieved still greater fame in science, and has also played an important rôle in statesmanship, both as the holder of a ministerial portfolio and as senator of Italy.

I remember very well a remark regarding his famous expression just referred to, which was made to me by Professor Moleschott in the course of a conversation not many years ago. It accords so well with what he had said in print that I think it will be no breach of confidence to mention it here. Remembering the suggestion of another well-known physiologist, that he had used it simply to illustrate and give point to the doctrine that thought and other mental operations are a function of matter, and thus stir up his ultra-conservative opponents, excite discussion, and propagate his tenets, I asked him what led him to make the statement in that form. He replied that of course he did not mean that intellectual energy was specifically dependent upon the consumption of phosphorus (indeed, that was clearly set forth in his writings at the time), and added with a smile, "Did you ever read —?" referring to an Italian book on the use of language. I was forced to confess that I had not, to which he replied, "There is a great deal in the way of putting things."

The saying served its purpose wonderfully even if, in its circulation, a shade of meaning has been added to it which it was not intended to convey. Not every man can penetrate to

the depths of human sentiment and coin from the common thought that is gathered there a phrase which will pass current everywhere and carry a doctrine with it. Like Grant's "Let us have peace" and Napoleon's "Providence is on the side of the strongest battalions," Moleschott's "Ohne Phosphor kein Gedanke" was a scintillation of genius.

If a current story is true, the idea that fish is especially good for brain-food can be traced to the elder Agassiz, though, for aught I know, it may be older. The story is that, years ago, Agassiz, who was then in the zenith of his fame and whose persuasive skill was scarcely inferior to his scientific genius, made an address in Massachusetts in behalf of a fish commission, and, with other considerations in its favor, urged that fish was very valuable for brain-food and that fish culture was hence peculiarly demanded by the marked intellectual activity of the people of that State. It would be superfluous to add that since that time fish culture has not languished in Massachusetts.

A gentleman well known in American science tells me that he once asked Agassiz what led him to this idea about fish as food, and that he replied, "Dumas [the French chemist] once suggested to me that fish contained considerable phosphorus and might on that account be especially good for food, and you know the old saying, 'Without phosphorus, no thought.' I simply put the two together."

Later, Mark Twain took up the idea and expressed it as follows (in "The Galaxy"):

"Young Author.—'Yes, Agassiz *does* recommend authors to eat fish, because the phosphorus in it makes brains. So far you are correct. But I cannot help you to a decision about the amount you need to eat—at least, with certainty. If the specimen composition you send is about your fair, usual average, I should judge that perhaps a couple of whales would be all you would want for the present. Not the largest kind, but simply good middling-sized whales.'"

As a vehicle for carrying the idea everywhere and "keeping it before the people" the efficiency of Mark Twain's joke was superlative. And aside from the intrinsic self-propagating power of the combination of joke and theory there was the widespread notion that phosphorus is the thought-producing element to help it. It would be hard to find conditions more favorable for the spread of a theory than were thus provided for this one of fish as nutriment for the brain. Coupled with the notion that phosphorus is the specific thought-element, it has coursed around the world.

Mr. E. G. Blackford, Fish Commissioner of New York and, I understand, the largest dealer in fish on this side of the Atlantic, assures me

of his belief that the theory materially increases the demand for fish as food. I have heard the same from other fish dealers, who say, "Why, you know fish is good brain-food." Indeed, it is really amusing, if one takes the trouble to notice, how many people will use the same expression, or one very much like it, if the subject is suggested. The theory is squarely adopted by some very prominent writers on foods, and is sometimes taught in schools. The Rev. Kām Chandra Bose, well known in Europe and America as one of the most learned of the Hindu converts to Christianity, tells me that if one were to "visit any of the great colleges in Calcutta and put to its advanced pupils the question, 'Why are the Bengalis intellectually superior to the other races of India?' the reply would be, 'Because they eat fish.' The belief that fish is rich in phosphorus, and hence serves to strengthen the brain more than other kinds of food do, is current among educated natives and their English teachers."

Even if fish were richer in phosphorus than meats or other food-materials this would not establish its superiority for the nutrition of the brain or the production of intellectual energy. But there is no proof of any especial abundance of phosphorus in fish. On the contrary, an extended series of analyses in this laboratory have revealed proportions of phosphorus in the flesh of our ordinary food fishes differing in no important degree from those which have been found to occur in the flesh of the other animals used for the food of man.

Perhaps some of the readers of this will put me down for an iconoclast, as did a most highly esteemed friend, who bade me, and with all candor and seriousness, to beware of thus ruthlessly attempting to uproot an old and important belief. But possibly they will have the charity to leave me a humble place in their consideration if I add that there is, after all, a way in which fish may make a very useful part of the diet of brain-workers.

Physiologists tell us that the way to provide for the welfare of the brain is to see that the rest of the body is in good order, that, in other words, the old proverb of "a sound mind in a sound body" is sound doctrine. And they are getting to tell us further that one way in which brain-work is hindered is by bad dietary habits, as, for instance, overloading the digestive organs by taking too much food. Of the vice of overeating (a vice which we Americans by no means monopolize) a considerable part, in this country at least, and I think in England and among well-to-do people on the Continent of Europe also, is the vice of

fat-eating. We are a race of fat-eaters. If any one doubts this, I think the statistics to be shown in a succeeding article will convince him, unless he is ready to deny the practically unanimous testimony of such facts as I have been able to gather. It comes about very naturally and is really due to the fertility of our soil, the consequent abundance of food, and the toothsome-ness of food-materials rich in fatty matters. The result of this is that the quantity of fat in the average American's dietary is very large indeed, mainly because of the large amounts of meats, butter, and lard consumed, and is far in excess of the demands of his body, unless he is engaged in very severe muscular work or exposed to extreme cold, or both. For people with sedentary occupations, including the majority of brain-workers, this simply means charging the organism with the burden of getting rid of an excess of material. This excess, the physiologists and physicians assure us, is detrimental.

If the reader will take the trouble to look at Diagram III. of the previous article of this series, he will see that the flesh of fish contains less fat than ordinary meats. Some kinds, like salmon, mackerel, white-fish, and shad, are quite fat, but the flesh of cod, haddock, bass, blue-fish, perch, flounder, indeed the majority of our most common food fishes, has extremely little of fatty and oily matters.

Now it seems to me very reasonable to assume that brain-workers and other people who do not have a great deal of muscular exercise may very advantageously substitute fish in the place of a portion of the meat which they would otherwise consume. I am very well aware that such hygienic advice might come more appropriately from a physician than from a chemist, and am therefore glad to be able to quote from no less an authority than Sir Henry Thompson, who urges "the value of fish to the brain-worker" on the ground that it "contains, in smaller proportion than meat, those materials which, taken abundantly, demand much physical labor for their complete consumption, and which, without this, produce an unhealthy condition of body, more or less incompatible with the easy and active exercise of the functions of the brain."

Perhaps I ought to add that the studies of the constitution of the flesh of fish in this laboratory, referred to above, as well as similar investigations elsewhere, show that, so far as the nutritive qualities are concerned, the only considerable difference between fish and ordinary meats is in the proportions of oily and fatty matters and water. The flesh of the fish has water where meats have fat.

W. O. Atwater.

A VISIT TO COUNT TOLSTOI.

THE visit to the Russian novelist Count Leo Tolstoi which forms the subject of the present paper was made in the latter part of the month of June, 1886; but it had been planned nearly a year before that time at one of the convict mines in Eastern Siberia, and was the result of a promise which I made to a number of Count Tolstoi's friends and acquaintances who were then, and are still, in penal servitude in the vast lonely wilderness of the Trans-Baikal. My first knowledge of the fact that there were friends and acquaintances of the Russian novelist among the political convicts at the Nertchinsk mines came to me in the shape of a request that I would carry a copy of his "Ispoved," or Confession, to one of his friends, a lady, who was serving out a sentence of twelve years' penal servitude at the mines of Kara. The book was under the ban of the ecclesiastical censor; its publication and circulation in Russia had been absolutely forbidden, and the copy which I was requested to deliver was in manuscript. How it had found its way in spite of censors, inquisitors, official package-openers, house-searchers, body-searchers, baggage-examiners, police-officers, and gendarmes to the remote East Siberian village where I was asked to take charge of it I do not know; but there it was, a silent but convincing proof of the futility of repressive measures when directed against human thought. It showed that the Government had not been able to keep a forbidden book even out of the hands of its own political convicts, living under strict guard in a penal settlement of the Trans-Baikal, five thousand miles from the fertile brain in which the prescribed ideas had their origin.

I consented, of course, to take charge of the manuscript, and in less than three months I had made the acquaintance not only of the lady for whom it was destined, but of many other political exiles in Eastern Siberia who had either known the great Russian author personally or had at some time been in correspondence with him. All of these exiles were very desirous that upon my return to European Russia I should see Count Tolstoi and describe to him the working of the exile sys-

tem and the life of political convicts at the mines and in the penal settlements of the Trans-Baikal. They seemed to have the impression that he was more or less in sympathy with their aims and hopes, if not with their methods, and that the information which I could give him would strengthen that sympathy, and perhaps change his attitude toward the Government from one of passive resistance to one of active and uncompromising hostility. This belief in the possibility of enrolling Count Tolstoi among the active enemies of the Government was founded, so far as I could judge, mainly upon the fact, known even to the exiles in Siberia, that most of his later writings had been prohibited by the censor. The conclusion drawn from that fact was that the author had attacked the Government, or at least had openly expressed his disapproval of its political methods. The conclusion, however, was erroneous. If these exiled revolutionists had been able to get and read Tolstoi's later books and articles, they would have seen at once that the suppressed literature was obnoxious to the ecclesiastical rather than to the civil power, and that the very corner-stone of Tolstoi's religious and social philosophy is non-resistance to evil. Most of these revolutionists, however, had been many years in prison or in exile; they had had no means of following closely the development of Tolstoi's ideas, and they were misled by a superficial resemblance between his views and theirs with regard to property and social organization, and by the attitude of hostility which the Government had taken toward his later writings. Believing, however, as they did, that he was wavering on the brink of open revolt, and that a little more provocation would cause him to throw the weight of his forceful personality and powerful influence against the despotism which they hated, they urged me to see him and tell him all that I knew about Russian administration in Siberia and about the treatment of the political exiles. They also turned over to me a ghastly narrative in manuscript of the "hunger strike"* of four educated women in the Irkoutsk prison, — one of them the sister of the well-known Russian publicist and political economist, V. V. Vorontsof, — and made me promise that I would give the document to Tolstoi to read. I took the manuscript and gave the promise, and un-

* A "hunger strike," in the language of Russian prisons, means organized voluntary self-starvation, undertaken by the prisoners as a last desperate protest against intolerable treatment, and continued until the

prison authorities yield to the strikers' demands, or the strikers themselves break down or die under the self-imposed torture.

der these circumstances my visit to the great Russian novelist was planned.

Many months elapsed before I returned to European Russia, and when at last I found myself once more in Moscow, I learned that Count Tolstoi had left the city and was spending the summer on his estate near the village of Yasnaya Polyana [Anglicè Clearfield], in the province of Tula. On the 16th of June I took the late evening train southward over the Moscow-Kursk railroad, and reached the town of Tula early the following morning. Count Tolstoi's estate is situated about ten miles from the town, on the old turnpike road from Moscow to Kursk. There is a railway station nearer to it than Tula, but express trains do not stop there, and I was obliged, therefore, to find some other means of conveyance to my destination. Selecting from the throng of droshky drivers at the railway station one in whose face there was an attractive expression of mingled shrewdness and good-humor, I called him to me and asked him if he knew Count Tolstoi. "Know our Bahrin!" he exclaimed with a broad smile and the half-caressing, half-deferential manner of the Russian peasant who has been accustomed to associate upon terms of permitted equality with his superiors. "How is it possible not to know the Graf? Why, he is ours!—he lives in Yasnaya Polyana, only fifteen versts from here."

"Is there an inn or a post station in Yasnaya Polyana where I can go?" I inquired.

"No," replied the droshky driver; "but why go to an inn? You can stay with the Count; he is a plain, simple man [*sofsem prostoi*]; he always shakes hands with me when I go there, and he works in the fields just like a common muzhik. He is a good man, our Bahrin; he will be glad to have you stay with him."

It seemed to me that it would be rather awkward, if not an unwarrantable presumption, for a stranger to go directly to Count Tolstoi's house, satchel in hand, as if to stay a week, but there did not seem to be any alternative; and trusting that the necessities of the case would be a sufficient apology for any apparent presumption, I made an agreement with the droshky driver for transportation to Yasnaya Polyana, and at 10 o'clock we rolled out of Tula upon the broad white turnpike which leads to Orel and Kursk.

It was a bright, sunshiny June morning; the atmosphere, cleared and freshened by recent rain, was full of fragrance and ozone; and as we reached the summit of a high hill behind the town, I looked out with delight over a vast cultivated landscape rising in places through splendid slopes of vivid green to dark ridges of forest, sinking again into deep sequestered valleys where clusters of brown thatched houses

hid themselves in clumps of olive foliage, and finally stretching away on the left to the distant horizon in one vast undulating expanse of growing wheat. Far or near there was not a fence, nor a wall, nor even a hedge to break with stiff rectangles the vast flowing outlines of the picture; nor could there anywhere be seen a single isolated house, barn, or granary. Only the high state of cultivation to which the land had been brought, and occasionally the green or golden dome of a village church, calling attention to a modest cluster of thatched cottages nestling under it in a clump of trees, showed that the beautiful picturesque country was inhabited. The roadside was bright with daisies, cranebill, poppies, and wild mustard; the warm air was laden with the perfume of clover, and yellow butterflies zigzagged in eccentric flight from flower to flower as if half intoxicated by the rich fragrance and yet unable to discover its source. Here and there beside the road ragged peasants, armed with short iron sledge-hammers, were sitting in a group on the ground near a conical pile of broken stone, cracking large water-worn pebbles which they held between their huge, shapeless, cloth-bandaged feet; and now and then we overtook a bare-headed, bare-footed peasant woman, with tucked-up skirts, trudging homeward from the market-place in Tula, with her purchases in a gray bag or hanging from a long pole carried over one shoulder.

About ten versts from Tula, in a shallow valley beside a brook, we came suddenly upon one of those scenes which are so characteristic of Russian life and Russian country roads in the early spring and summer. It was a group of "bogomoltsi," or pilgrims, who had been resting and eating their lunch of black rye-bread and tea beside the road under the shade of a clump of trees. They were all women, and as we passed they sprang to their feet, picked up their long walking-poles, tied their tea-kettles and tin cups to their girdles, shouldered their gray linen bags, and trudged away from their smoldering camp fire, as if ashamed to have been seen in the act of yielding to such a weakness of the flesh as a desire for rest and food. They were nearly all women past middle age; their coarse, ragged, dust-whitened attire, basket sandals, and bandaged legs were evidences of extreme poverty; and their hard, sun-burned features were as stolid and expressionless as if they had never had a thought beyond the gratification of mere animal impulses; and yet these "God-worshippers," forsaking homes, families, and friends, had walked across half the empire, and were bound for the great Troitskaya monastery,—the Canterbury of Russia,—forty-five miles beyond Moscow. For weeks they had not

changed their clothing, eaten a substantial meal, or slept in a bed, and for weeks to come they would trudge wearily along the highways of Russia in scorching heat and drenching rain, ready to do all, bear all, and suffer all, if at last they might press their faces to the cold stone floor of the Cathedral of the Trinity, drink out of the holy well of Saint Sergius, and pray before the massive silver shrine in which the relics of that holy man repose. During the months of May and June — and in fact throughout the summer — there are thousands of such parties of pilgrims on the march in all parts of the empire. Some are bound for the catacombs of Saint Anthony, in Kiev; some for the ancient monastery of Saint Valamo, on Lake Ladoga; some for the holy shrines of Novgorod the Great; some for the monastery of Solovetsk, on the bleak arctic coast of the White Sea; and a few for the holy places of far-away Jerusalem. To a casual observer in the streets of Moscow these wandering “*bogomoltsi*” and “*stranniki*” seem at times to compose a quarter of the population of the city.

As we left behind us one by one the black-and-white barred posts which mark the long versts between stations on a Russian post-road, the heat of the sun grew more and more oppressive, and the blinding reflection of its vertical rays from the white unshaded turnpike became more and more insupportable, until my head and eyes ached with the heat and the glare. I was just about to ask my driver if we were not almost there when he gathered up his reins, turned into what seemed to be an old wood-road leading away from the turnpike on the right in the direction of an inclosed forest, and said, “*Na konets daiekheli*,” — “At last we have arrived.” I looked eagerly around for the imposing baronial mansion which I had pictured to myself as the country home of the great author, who was at the same time a wealthy Russian noble; but, with the exception of a little cluster of thatched log-houses on the crest of a sloping ridge about a mile away, I could not see a sign of human habitation.

“Where is the Count’s house?” I inquired.

“It is over there in the woods,” replied the driver, pointing with his whip; “you can’t see it until you get close to it. Here is the gate of the park,” he added, as, skirting the edge of a mud-hole, we turned again to the right and passed between two high and evidently ancient brick columns, which were hollow on the inner side, as if to afford places of shelter for gate-keepers or sentinels. Nothing, except these columns and an artificial but long-neglected pond which glimmered between the trees on the left, indicated that we were in a park or upon the premises of a wealthy Russian landowner. I

should have supposed that we were taking “a short cut” through the woods to some peasant village. The road had not been graveled, and was muddy from recent rain; the grass under the forest trees was long, choked by weeds, and mingled with wild flowers; and there was not the slightest evidence anywhere of care, cultivation, or pride in the appearance of the grounds. About two hundred yards from the gateway the road turned suddenly to the right and stopped abruptly at one end of a plain, white, rectangular, two-story house of stuccoed brick standing among the trees in such a position that it could not be seen from the road at a greater distance than thirty or forty yards. It would be hard to imagine a simpler, barer, less pretentious building. It had neither piazzas nor towers nor architectural ornaments of any kind; there were no vines to soften its hard rectangular outlines or relieve the staring whiteness of its flat walls; and its front door, which looked so much like a side or back door that I did not dare to knock at it, was situated nearer the end than the center of the façade, and was reached by a flight of steps and a small square platform of gray, uncut paving-stones with grass growing in the chinks.

At the end of the house where the road stopped there was a croquet ground of bare, hard-trodden earth, and on a bench beside it, in the shade of a tree, sat a lady in a broad-brimmed, summer hat, reading. Not feeling sure that what I saw was the front of the house, and dreading the awkwardness of knocking at what might prove to be the kitchen or dining-room door, I crossed the croquet ground, apologized to the lady for interrupting her reading, and inquired if the Count was at home. She replied that she believed he was, and, asking me to follow her, she entered the house, requested me to be seated in a small reception-room, and then, turning to an open door in a wooden partition, she called in English, “Count, are you there?” A deep voice from the other side of the partition replied, “Yes.” “A gentleman wishes to see you,” she said, and then, without waiting for a response, she returned to the croquet ground. There was the sound of a moving chair in the adjoining room, and in a moment Count Tolstoi appeared at the door. I had heard not a little from his friends with regard to his eccentricities in the matter of dress; I had been shown photographs of him in peasant garb, and I did not therefore expect to see a man clothed in soft raiment; but I was hardly prepared, nevertheless, for the extreme unconventionality of his attire.

The day was a warm and sultry one; he had just returned from work in the fields, and his apparel consisted of heavy calfskin shoes, loose, almost shapeless, trousers of the coarse

homespun linen of the Russian peasants, and a white cotton undershirt without collar or neckerchief. He wore neither coat nor waistcoat, and everything that he had on seemed to be of domestic manufacture. But even in this coarse peasant garb Count Tolstoi was a striking and impressive figure. The massive proportions of his heavily molded frame were only rendered the more apparent by the scantiness and plainness of his dress, and his strong, resolute, virile face, deeply sunburned by exposure in the fields, seemed to acquire added strength from the feminine arrangement of his iron-gray hair, which was parted in the middle and brushed back over the temples. Count Tolstoi's features may be best described in Tuscan phrase as "molded with the fist and polished with the pickaxe," and the impression which they convey is that of independence, self-reliance, and unconquerable strength. The face does not seem at first glance to be that of a student or a speculative thinker, but rather that of a man of action accustomed to deal promptly and decisively with perilous emergencies, and to fight fiercely for his own hand, regardless of odds. The rather small eyes deeply set under shaggy brows are of the peculiar gray which lights up in excitement with a flash like that of drawn steel; the nose is large and prominent with a singular wideness and bluntness at the end; the lips are full, and firmly closed; and the outlines of the chin and jaws, so far as they can be seen through the full gray beard, only give additional emphasis to the expression of virile strength, which is the distinguishing characteristic of the large, rugged face.

In the book which has been translated into English by Isabel F. Hapgood, and published in New York under the title of "Childhood, Boyhood, and Youth," Count Tolstoi refers to the pain which he felt at the early age of six years when his mother was obliged to confess that he was a homely boy. "I fancied," he says, "that there was no happiness on earth for a person with such a wide nose, such thick lips, and such small gray eyes as I had; I besought God to work a miracle, to turn me into a beauty, and all I had in the present or might have in the future I would give in exchange for a handsome face." But there is something better and higher in Count Tolstoi's face than mere beauty or regularity of feature, and that is the deep impress of moral, intellectual, and physical power.

He stood for an instant on the threshold as if surprised to see a stranger, but quickly advanced into the room with outstretched hand, and when I had briefly introduced myself he expressed simply but cordially the great pleasure and gratification which he said it gave him

to receive a visit from a foreigner, and especially from an American. I explained to him that my call was the result partly of a promise which I had made to some of his friends and admirers in Siberia, and partly of a desire to make the personal acquaintance of an author whose books had given me so much pleasure.

"What books of mine have you read?" he asked quickly. I replied that I had read all of his novels, including "War and Peace," "Anna Karenina," and "The Cossacks."

"Have you seen any of my later writings?" he inquired.

"No," I said; "they have all, or nearly all, appeared since I went to Siberia."

"Ah!" he responded, "then you don't know me at all. We will get acquainted."

At this moment my ragged and generally unpresentable droshky driver, whose existence I had wholly forgotten, entered the door. Count Tolstoi at once rose, greeted him cordially as an old acquaintance, shook his hand as warmly as he had shaken mine, and asked him with unaffected interest a number of questions about his domestic affairs and the news of the day in Tula. It was perhaps a trifling incident, but I was not at that time as well acquainted as I now am with Count Tolstoi's ideas concerning social questions, and to see a wealthy Russian noble, and the greatest of living novelists, shaking hands upon terms of perfect equality with a poor, ragged, and not overclean droshky driver whom I had picked up in the streets of Tula was the first of the series of surprises which made my visit to Count Tolstoi memorable. When the droshky driver, after inquiring affectionately with regard to the health of the Countess and of all the children, had taken his departure, Count Tolstoi excused himself for a moment and returned to the apartment out of which he had come, leaving me alone.

The room where I sat was small and nearly square, and seemed to serve a double purpose as a reception-room and a hall. Two of its walls were of white plaster; the third consisted of one side of a large oven covered with glazed tiles, and the fourth was formed by an unpainted wooden partition pierced by a door which opened apparently into Count Tolstoi's library or work-room. The floor was bare; the furniture, which was old-fashioned in form, consisted of two or three plain chairs, a deep sofa, or settle, upholstered with worn green morocco, and a small cheap table without a cloth. Three pairs of antlers were fastened against the walls, and upon one of them hung an old slouch hat and a white cotton shirt similar to that which Count Tolstoi had on. There was a marble bust in a niche behind the settle, but the only pictures which the

room contained were a small engraved portrait of Dickens and another of Schopenhauer. It would be impossible to imagine anything plainer or simpler than the room and its contents. More evidences of wealth and luxury might be found in many a peasant's cabin in Eastern Siberia.

Before I had had time to do more than glance hastily about me, Count Tolstoi reappeared in the act of belting around his waist, with a wide black strap, a coarse gray blouse, or tunic, of homespun linen, which he had put on in the adjoining room. Then seating himself beside me, he began to question me about the journey to Siberia from which I had just returned, and I — mindful of my promise to the exiles — began to tell him what I knew about Russian administration and the treatment of political convicts. It soon became evident that he was not to be surprised, or shocked, or aroused by any such information as I had to give him. He listened attentively, but without any manifestation of emotion, to my descriptions of exile life, and drew from the storehouse of his own experience as many cases of administrative injustice and oppression that were new to me as I could give that were new to him. He was evidently familiar with the whole subject, and had with regard to it well-settled views which were not to be shaken by a few additional facts not differing essentially from those that he had previously considered. I finally asked him whether he did not think that resistance to such oppression was justifiable.

"That depends," he replied, "upon what you mean by resistance; if you mean persuasion, argument, protest, I answer yes; if you mean violence — no. I do not believe that violent resistance to evil is ever justifiable under any circumstances."

He then set forth clearly, eloquently, and with more feeling than he had yet shown, the views with regard to man's duty as a member of society which are contained in his book entitled "*My Religion*," and which are further explained and illustrated in a number of his recently published tracts for the people. *He laid particular stress upon the doctrine of non-resistance to evil, which, he said, is in accordance both with the teachings of Christ and the results of human experience. He declared that violence, as a means of redressing wrongs, is not only futile, but an aggravation of the original evil, since it is the nature of violence to multiply and reproduce itself in all directions. "The revolutionists," he said, "whom you have seen in Siberia, undertook to resist evil by violence, and what has been the result? Bitterness, and misery, and hatred, and bloodshed! The evils against which they took up arms still exist, and to them has been added a

mass of previously non-existent human suffering. It is not in that way that the kingdom of God is to be realized on earth."

I cannot now repeat from memory all the arguments and illustrations with which Count Tolstoi enforced his views and fortified his position; but I still remember the eloquence and earnestness with which they were presented, and the deep impression made upon me by the personality of the speaker. The ideas themselves were not new to me; I had repeatedly heard them discussed in literary circles in St. Petersburg, Moscow, Tver, and Kazan; but they never appealed to me with any real force until they came from the lips of a strong, sensitive, and earnest man who believed in them with passionate fervor.

For a long time I did not suggest any difficulties or raise any objections; but at last I made an effort to escape from the enthrallment of Count Tolstoi's strong personal influence by proposing to him questions which would necessitate the application of his general principles to specific cases. It is one thing to ask a man in a general way whether he would use violence to resist evil, and quite another thing to ask him specifically whether he would knock down a burglar who was about to cut the throat of his mother. Many men would say *yes* to the first question who would hesitate at the second. Count Tolstoi, however, was consistent. I related to him many cases of cruelty, brutality, and oppression which had come to my knowledge in Siberia, and at the end of every recital I said to him, "Count Tolstoi, if you had been there and had witnessed that transaction, would you not have interfered with violence?" He invariably answered, "No." I asked him the direct question whether he would kill a highwayman who was about to murder an innocent traveler, provided there were no other way to save the traveler's life. He replied, "If I should see a bear about to kill a peasant in the forest, I would sink an axe in the bear's head; but I would not kill a man who was about to do the same thing." There finally came into my mind a case which, although really not worse than many that I had already presented to him, would, I thought, appeal with peculiar force to a brave, sensitive, chivalrous man.

"Count Tolstoi," I said, "three or four years ago there was arrested in one of the provinces of European Russia a young, sensitive, cultivated woman named Olga Liubatovitch. I will not relate her whole history; it is enough to say that, inspired by ideas which, even if mistaken, were at least unselfish and heroic, she, with hundreds of other young people of both sexes, undertook to overturn the existing system of government. She was arrested, thrown

into prison, and after being kept for a year in solitary confinement she was exiled to Siberia by administrative process. You perhaps know — or if you do not know, I can tell you — what hardships and sufferings and humiliations a young girl must undergo who is sent to Siberia alone by *'etape'* with a common criminal party. You can imagine the state of nervous excitement, the abnormal mental and emotional condition, to which she is brought by months of riding in springless telegas; by being compelled to yield to the demands of nature under the eyes of a soldier, and by sleeping for weeks on the hard benches and in the foul air of *'etapes'* swarming with vermin. In this abnormal mental and emotional condition Olga Liubavitch reached the town of Krasnoyarsk in Eastern Siberia. She had up to this time been permitted to wear her own dress and her own underclothing; but at Krasnoyarsk the local governor directed that she should put on the dress of a common convict. She refused to do so upon the ground that administrative exiles had the right to wear their own clothing, and that if convict dress had been obligatory, she would have been required to put it on before she left Moscow. The local governor insisted upon obedience to his order, and Miss Liubavitch persisted in refusal. I do not know the reason for her obstinacy, but as convicts are not always supplied with new clothing, and are sometimes compelled to put on garments which have already been worn by others and which are foul and full of vermin, it is not difficult to suggest a number of good reasons for objecting to such a change. The chief of police and the officer of the convoy were finally directed to use force. In their presence, and that of half a dozen other men, three or four soldiers seized the poor girl and attempted to take off her clothes. She resisted, and there followed a horrible scene of violence and unavailing self-defense. Her lips were cut in the contest and her face covered with blood, but she continued to resist as long as she had strength. In spite of her cries, appeals, and struggles, she was finally overpowered, stripped naked under the eyes of six or eight men, and forcibly re clothed in the coarse convict dress. Now," I said, "suppose that all this had occurred in your presence; suppose that this bleeding, defenseless, half-naked girl had appealed to you for protection and had thrown herself into your arms; suppose that it had been your daughter — would you still have refused to interfere by an act of violence?"

He was silent. His eyes filled with tears as his imagination pictured to him the horror of such a situation, but for a moment he made no reply. Finally he said, "Do you know absolutely that that thing was done?"

"No," I said, "because I did not see it done; but I have it from two eye-witnesses, one of them a lady in whose statements I put implicit trust, and the other an officer of the exile administration. They saw it and they told me."

Again he was silent. Finally, ignoring my direct question as to what he personally would have done in such a case, Count Tolstoi said, "Even under such circumstances violence would not be justifiable. Let us analyze that situation carefully. I will grant, for the sake of argument, that the local governor who ordered the act of violence was an ignorant man, a cruel man, a brutal man — what you will; but he probably had an idea that he was doing his duty; he probably believed that he was enforcing a law of the Government to which he owed obedience and service. You suddenly appear and set yourself up as a judge in the case; you assume that he is not doing his duty,—that he is committing an act of unjustifiable violence,—and then, with strange inconsistency, you proceed to aggravate and complicate the evil by yourself committing another act of unjustifiable violence. One wrong added to another wrong does not make a right; it merely extends the area of wrong. Furthermore, your resistance, in order to be effective,—in order to accomplish anything,—must be directed against the soldiers who are committing the assault. But those soldiers are not free agents; they are subject to military discipline and are acting under orders which they dare not disobey. To prevent the execution of the orders you must kill or maim two or three of the soldiers—that is, kill or wound the only parties to the transaction who are certainly innocent, who are manifestly acting without malice and without evil intention. Is that just? Is it rational? But go a step further: suppose that you do kill or wound two or three of the soldiers; you may or may not thus succeed in preventing the completion of the act against which your violence is a protest; but one thing you certainly will do, and that is, extend the area of enmity, injustice, and misery. Every one of the soldiers whom you kill or maim has a family, and upon every such family you bring grief and suffering which would not have come to it but for your act. In the hearts of perhaps a score of people you rouse the anti-Christian and anti-social emotions of hatred and revenge, and thus sow broadcast the seeds of further violence and strife. At the time when you interposed there was only one center of evil and suffering. By your violent interference you have created half a dozen such centers. It does not seem to me, Mr. Kennan, that that is the way to bring about the reign of peace and good-will on earth."

My curiosity as to the extent to which Count Tolstoi would go in the application of his general principles to specific cases was entirely satisfied. The answer to this reasoning, from the point of view of sociology, is obvious, but it was not my purpose to object, or argue, more than might be necessary to bring out Count Tolstoi's views in their full strength.

Further conversation was prevented by a summons to lunch, which was served in a large, cheerful, sunny room in the second story. This part of the house, so far as plainness and simplicity are concerned, was perfectly in harmony with the part that I had already seen. The floor was bare; the furniture was homely and old-fashioned; the windows were hung with simple white muslin curtains without lambrequins or unnecessary drapery; and the whitewashed walls were relieved only by a few oil portraits in faded gilt frames, which evidently represented ancestors and dated from the last century.

At lunch I met, for the first time, Count Tolstoi's large family, which consisted of the Countess, a stately, dark-eyed, dark-haired lady, who must in her youth have been extremely beautiful; the eldest son, who had recently been graduated from one of the Russian universities; the eldest daughter, a girl perhaps twenty years of age; two bright-faced nieces, and three or four younger children. There were also present a young man in a highly ornamented peasant costume, worn evidently from caprice or in imitation of the Count, and two ladies of middle age whose relations to the family I could not determine, but who were probably nothing more than friends and converts to the Tolstoi philosophy.

The lunch passed quickly with bright, spontaneous conversation, in which all joined without the least appearance of formality or restraint, and in the course of which Count Tolstoi himself manifested more boyishness and gayety than I had yet given him credit for. When we had risen from the table he produced and proceeded to sell at auction to the highest bidder a richly embroidered towel; the work of a peasant woman, which, he said, had been brought to him as a present, but which he was unwilling to accept because the giver was very poor and really in need of the money that the towel represented. Amid general laughter Count Tolstoi's son and I, who were the principal bidders, ran the price up by successive offers of five kopeks more to two roubles and a half, when the auctioneer, with non-professional candor, declared that that was too much; that the American traveler in the course of the bidding had offered two roubles, which was about what the towel was worth, and that consequently it was his duty to award

it to him. Young Tolstoi, with mock indignation, protested against the unfairness of that sort of an auction, but his motion for a new trial was overruled on the novel ground that the towel belonged to the auctioneer, who therefore had an unquestionable right to knock it down to any bidder whom he chose. His son laughingly acquiesced in the ruling, and the merry group which had gathered about the auctioneer dispersed.

I had not yet had a favorable opportunity to show Count Tolstoi the manuscript embodying the narrative of the "hunger strike" in the Irkoutsk prison, which I had promised the political exiles in the Trans-Baikal that I would give to him. Upon our return to the little reception-room on the first floor, I raised again the question of the treatment of the political convicts in Siberia, and, as an illustration of some of my statements, I handed him the manuscript. It was a detailed history of the voluntary self-starvation of four political convicts, all educated women, in the prison at Irkoutsk. This "hunger strike," which took place in December, 1884, lasted sixteen days, and brought all of the women very near to death. It was undertaken as the last possible protest against what they regarded as intolerable cruelty. The narrative was written by Madame Rossikova, one of the "hunger strikers," and was smuggled out of the prison by an administrative exile who occupied a cell near hers, and who succeeded in opening communication with her at night by means of a cord, with a small weight attached, which he swung within reach of her window. I shall in a subsequent paper give a translation of this narrative, and I need only say here that it is a detailed account of perhaps the most desperate "hunger strike" recorded in the annals of Russian prisons.

Count Tolstoi read three or four pages of the manuscript with a gradually clouding face, and then returned it to me. His manner and his subsequent conversation conveyed to my mind the impression that he was already overburdened with a consciousness of human misery, and that he shrank from the contemplation of more suffering which he was powerless to relieve, and which could not change his views with regard to the principles that should govern human conduct.

"I have no doubt," he said, "that the courage and fortitude of these people are heroic, but their methods are irrational, and I cannot sympathize with them. They resorted to violence, knowing that they rendered themselves liable to violence in return, and they are suffering the natural consequences of their mistaken action. I cannot imagine," he continued, "any darker conception of hell than the state

of some of those unfortunate people in Siberia, whose hearts are full of bitterness and hatred, and who, at the same time, are absolutely powerless even to return evil for evil. If," he added after a moment's pause, "they had only changed their views a little,—if they had adopted the course which seems to me the only right one to pursue in dealing with evil,—what might not such people have done for Russia! Mine is the true revolutionary method. If the people of the empire refuse, as I believe they should refuse, to render military service,—if they decline to pay taxes to support that instrument of violence, an army,—the present system of government cannot stand. The proper way to resist evil is to absolutely refuse to do evil either for one's self or for others."

"But," I said, surprised by this advocacy of a revolutionary method which seemed to me utterly impracticable and visionary, "the Government *forces* its people to render military service and pay taxes—they *must* serve and pay or go to prison."

"Then let them go to prison," he rejoined. "The Government cannot put the whole population in prison; and if it could, it would still be without material for an army and without money for its support."

"But," I objected, "you cannot get the whole people to act simultaneously in this way. If you were let alone, you could perhaps convert a few hundred thousand peasants to your views; but do you think that you would be let alone? As soon as your teaching began to be dangerous to the stability of the state it would be suppressed. Suppose, for the sake of argument, that you succeeded in converting a quarter of the population; the Government would draw soldiers enough from the other three quarters to put that one quarter in prison or in Siberia, and there would be an end of your propaganda and your revolution. It seems to me that the first thing to be done is to obtain freedom of action—peaceably if possible, forcibly if necessary. You cannot persuade, nor teach, nor show people how they ought to live, if some other man holds you by the throat and chokes you every time you open your mouth or raise your hand. How are you ever going to get your propaganda under way?"

"But do you not see," replied the Count, "that if you claim and exercise the right to resist by an act of violence what you regard as evil, every other man will insist upon his right to resist in the same way what he regards as evil, and the world will continue to be filled with violence? It is your duty to show that there is a better way."

"But," I objected, "you cannot show any-

thing if somebody smites you on the mouth every time you open it to speak the truth."

"You can at least refrain from striking back," replied the Count; "you can show by your peaceable behavior that you are not governed by the barbarous law of retaliation, and your adversary will not continue to strike a man who neither resists nor tries to defend himself. It is by those who have suffered, not by those who have inflicted suffering, that the world has been advanced."

I said it seemed to me that the advancement of the world had been promoted not a little by the protests—and often the violent and bloody protests—of its inhabitants against wrong and outrage, and that all history goes to show that a people which tamely submits to oppression never acquires either liberty or happiness.

"The whole history of the world," replied the Count, "is a history of violence, and you can of course cite violence in support of violence; but do you not see that there is in human society an endless variety of opinions as to what constitutes wrong and oppression, and that if you once concede the right of any man to resort to violence to resist what he regards as wrong, he being the judge, you authorize every other man to enforce his opinions in the same way, and you have a universal reign of violence?"

"If, on the other hand," I said, "oppression is advantageous to the oppressor, and if he finds that he can oppress with impunity and that nobody resists, when is he likely to stop oppressing? It seems to me that the peaceable submission to injustice which you advocate would simply divide society into two classes: tyrants, who find tyranny profitable, and who therefore will continue it indefinitely, and slaves, who regard resistance as wrong, and who will therefore submit indefinitely."

Count Tolstoi, however, continued to maintain that the only way to abolish oppression and violence is to refuse absolutely to do violence regardless of provocation. He said that the policy of passive resistance to evil which he advocated as a revolutionary method is in complete harmony with the character of the Russian peasant, and he referred to the wide and rapid spread of religious dissent in the empire as showing the chance of success which such a policy would have in spite of repressive measures.

After some further conversation Count Tolstoi proposed that we should take a walk, and I assented. A short distance from the house we met Miss Tolstoi, the Count's eldest daughter, dressed as a peasant girl, on her way home from the fields where she had been raking hay with the village girls of Yasnaya Polyana.

The peasant dress of bright scarlet, cut low in the neck all around, the braided hair, and the strings of large colored glass beads which hung in festoons over her breast, changed her appearance so completely that I did not recognize her until her father called her by name. It appeared that she shared his views with regard to manual toil, and was accustomed to work in the fields of any poor neighbor who was in need of assistance. Count Tolstoi himself had spent the morning in spreading manure over the land of a poor widow who lived near his estate, and would have devoted the afternoon to the same occupation but for my visit.

"I believe," he said, "that it is every man's duty to labor for others who need assistance, and to work at least a part of every day with his hands. It is better to actually labor for and with the poor in their particular employment, than it is to work in your own higher and possibly more remunerative intellectual field and then give the poor the results of your labor. In the one case you not only help the people who need help, but you set the poor and the idle an example; you show them that you do not regard even their prosaic toil as beneath your dignity, and you thus teach them self-respect, industry, and contentment with their lot. If, on the other hand, you work exclusively in your own higher intellectual field and give the poor the results of your labor, as you would give alms to a beggar, you encourage idleness and dependence; you establish a social class distinction between yourself and the recipient of your alms; you break down his self-respect and self-reliance, and you inspire him with a longing to escape from the hard conditions of his own life of daily physical toil, and to share your life, which he thinks is easier than his; to wear your clothes, which seem to him better than his, and to gain admission to your social class, which he regards as higher than his. That is not the way to help the poor or to promote the brotherhood of man."

"If I admit," I said, "that it is man's highest duty to do good to others, and that he owes only a secondary duty to himself and to his family, I cannot dispute the soundness of your reasoning. If I accept your premises I leave myself no ground to stand on in an argument; but, waiving that point, the characteristic of your scheme that strikes me most forcibly is its utter impracticability. Given the present organization of society and the existing traits of human character, it seems to me that a man who practices non-resistance, and who devotes his life to the good of others, simply sacrifices himself and his family without any commensurate gain to the world, because nobody else acts upon the same principles."

"You say," rejoined Count Tolstoi, "that if you admit my premises you leave yourself no ground to stand on in an argument; but why should you not admit my premises? You *must* admit my premises. If every man should do good to every other man instead of evil, the condition of things would be better than it is now, would it not? The state of society in which every man shall do good instead of evil is a thing to be hoped for and worked for, is it not? Then why do you say that I am impracticable when I hope and work for the realization of a social state which you yourself admit is desirable? If we are ever to reach that desirable social state somebody must make a beginning, must he not? Somebody must take a step in that direction and show that it is possible to live so? What if the present organization of society and the existing traits of human character do make such a step difficult — that has no bearing on my personal duty. The question is not what is easy, but what is right. There is nothing sacred or necessarily immutable about the present organization of society and the existing traits of human character. They are the results of man's activity, and by man's activity they can be changed. I believe that they ought to be changed, and I am doing what I can to change them."

Count Tolstoi then related with great fullness of detail the history of his change of attitude toward the teaching of Christ, and the steps by which he was brought to see that that teaching, rightly understood, furnishes a reasonable solution of some of the darkest problems of human life. He based upon it not only his opposition to resistance as a means of overcoming evil, but his hostility to courts of justice, established churches, class distinctions, private property, and all civil and ecclesiastical organization in existing forms. His frequent references to the New Testament, and his insistence on the precepts of Christ as furnishing the only rule for the right government of human conduct, might lead one to regard Count Tolstoi as a devout and orthodox Christian, but, judged by a doctrinal standard, he is very far from being so. He rejects the whole doctrinal framework of the Christian scheme of redemption, including original sin, atonement, the triune personality of God, and the divinity of Christ, and has very little faith in the immortality of the soul. His religion is a religion of this world, and it is based almost wholly upon terrestrial considerations. If he refers frequently to the teachings of Christ, and accepts Christ's precepts as the rules which should govern human conduct, it is not because he believes that Christ was God, but because he regards those precepts as a formal embodiment of the high-

est and noblest philosophy of life, and as a revelation, in a certain sense, of the Divine will and character. He insists, however, that Christ's precepts shall be understood — and that they were intended to be understood — literally and in their most obvious sense. He will not recognize nor tolerate any softening or modification of a hard commandment by subtle and plausible interpretation. If Christ said, "Resist not evil," he meant resist not evil. He did not mean resist not evil if you can help it, nor resist not evil unless it is unbearable; he meant resist not at all. How unflinchingly Count Tolstoi faces the logical results of his system of belief I have tried to show.

We wandered aimlessly about his estate, talking and arguing, nearly the whole afternoon; I do not remember where we went; I cannot remember anything that I saw; I was conscious only of the stream of ideas, arguments, and illustrations which flowed unceasingly from his mind into mine, and the emotions which were roused by it, and by the strong, earnest, lovable personality of the man himself.

Late in the afternoon we were compelled by a summer shower to take refuge in the house, and Count Tolstoi invited me into his work-room. It was very small, not much larger than an ordinary bedroom, and the cell of a hermit could hardly have been less luxurious. It contained no furniture except a narrow iron bedstead, a single plain wooden chair, and a small table of stained pine covered with worn green morocco. There was a portrait over the table of a well-known Russian dissenter named Siutaief, and around the walls were book-shelves filled with books, mostly in paper covers, but I could see nothing else to distinguish Count Tolstoi's library from a room in the house of any well-to-do peasant.

"I receive many letters," said the Count, opening a drawer in the table, "from people in America who have read my 'Confession' and 'Religion' — here is one"; and he put into my hands a letter from some man living in a village in the backwoods of Pennsylvania, informing the Count that he — the writer — and many of his fellow-villagers had long practiced the principles advocated in "My Religion"; that they "confessed the truth as it is in Jesus," and that they had recently organized a church.

"Now," said the Count, "what do you think of that letter? You see he doesn't understand; he thinks that he cannot have religion without a church. I wrote him that he didn't need a church in order to live rightly."

At this moment there entered the room a young man shabbily dressed in the garb of a common peasant, who brought to Count Tolstoi the day's mail from the neighboring village.

I took the man to be a servant employed about the stables, and did not rise from my seat. I was greatly surprised therefore when Count Tolstoi introduced him to me as Mr. F., one of his friends and co-workers. He proved to be an educated gentleman, a graduate of one of the Russian universities, and the most consistent and thorough-going of Count Tolstoi's disciples. He carried the latter's principles in fact to the utmost limit of logical application. He had no property, no home, not even a settled place of abode. He worked constantly for others, and refused absolutely to receive any compensation except food, clothing, and shelter. Even these necessities of life he accepted not as payment for his labor, but merely as things which every man is bound to give every other man if they are needed. He toiled wherever he thought his work would be most useful; when he needed clothes, he asked some peasant woman to make them for him; when he was hungry, he went to the nearest house for food; and when night came, he slept under any roof where he happened to be. In short, he devoted his life to society at large, and society at large supported him. He paid no taxes, refused to take out a passport, ignored the Government in every way, and was liable to arrest at any moment as a vagrant. If he had been arrested, he would have persisted in his refusal to pay taxes which might be used to support an army, and would have gone quietly, if not contentedly, to prison. Could there be a more perfect illustration of altruistic principles carried unflinchingly to their logical conclusion?

Among the letters and packages brought from the post-office by this young man was a copy of the English translation, published in New York, of Count Tolstoi's book entitled "My Religion." It was the first time he had seen it in its English dress, and he expressed a curiosity to know whether or not the translation, which had been made through the French, was a good one. He brought out the original manuscript, which bore evident traces of much handling and copying, and we compared three or four pages of it with the translation. The author seemed to be satisfied, and said, "The ideas are apparently all there."

The conversation then turned upon foreign editions of his books, and he said that he had recently received from the American publishers of one of his novels an offer of a royalty, upon condition that he should allow that firm to call theirs the authorized edition of his works. He had written them, he said, that he did not recognize nor believe in contracts or agreements, and that he did not desire to have anything to do with the foreign sale of his novels. He spoke slightly, almost contemptuously, of his works of fiction, and seemed

to regard them for the most part as monuments of misdirected energy. He had great difficulty, he said, in getting his religious ideas before the Russian people on account of the attitude of hostility taking toward them by Pobedonostsef, the Procureur of the Holy Synod, and by the ecclesiastical censor. I told him that I had seen many lithographed and hektographed copies of his later writings in circulation in St. Petersburg and Moscow.

"Yes," he replied; "the Government will not allow me to print them, but it cannot suppress them altogether. Sometimes it proscribes my ideas in one form and allows them to be printed in another. It refused me permission to publish in the form of an argument the ideas contained in 'Ivan Durak' ('Ivan the Fool'). I recast them in the form of a short story for the common people, and the censor passed them without objection. I was forbidden to print my 'Ispoved' ('Confession'), but the ecclesiastical authorities finally printed it themselves in their own 'Orthodox Review,' with an elaborate refutation of my heresies by a prelate of the church. I am told," he added with a smile, "that in the public libraries the only leaves of the 'Orthodox Review' that are cut are those on which my 'Confession' is found."

Our conversation was interrupted at this point by the announcement of dinner. Count Tolstoi of course made no change in his dress; I was unable to make any change in mine even had I felt disposed to do so, and the ladies alone showed a disposition to respect the established conventionalities of life in the matter of apparel. The dinner was simple, informal, and in every way enjoyable. The conversation, as at lunch, was bright and unconstrained, and Count Tolstoi himself in particular seemed to participate with keen zest in the laughter, raillery, and badinage of the younger people. His relations with his children, whenever I saw them together, were everything that such relations should be — cordial, sympathetic, and affectionate.

After dinner the family again separated. The young man who had brought the mail from the post-office, and one of the two ladies whom I supposed to be visiting disciples of

the Count, had a philosophic symposium in his work-room, where I found them later in the evening, reading and discussing one of his unpublished manuscripts. The Countess Tolstoi invited me to drink tea in her sitting-room, and there we were soon afterward joined by the Count, who brought in with him a large lap-board, an open box, or tray, containing shoemaker's instruments and appliances, and an unfinished pair of shoes. Seating himself quietly in a good light, he laid the board across his knees, took up one of the shoes, and began to put on a heel, as if it were the most natural thing in the world for the author of "Anna Karenina," and the owner of an estate worth six hundred thousand roubles, to spend his evenings in cobbling. I had already been surprised so many times that day that my nervous organization had nearly ceased to respond to that sort of emotional stimulation; but the discovery that Count Tolstoi was a shoemaker had still enough piquancy and grotesqueness about it to excite a faint thrill of wonderment. I seated myself directly opposite him, where I could occasionally facilitate his labor by handing him the necessary implements, and he discoursed learnedly upon shoemaking as an art, and explained to me the fine points of workmanship involved in putting on a heel and the extreme difficulty of trimming a sole neatly without cutting the "upper." He seemed to feel more honest pride in his ability to make a shoe than in his ability to write "War and Peace" or "The Cossacks"; but after watching the progress of his labor for half an hour with an unprejudiced, if an uncritical, eye, I decided, with all respect for the versatility of his talent, that I would rather read one of his novels than wear a pair of his shoes.

After some further talk upon the art of shoemaking, accompanied by practical illustrations, Count Tolstoi turned the conversation to America, and began to ask me questions about people and things there that interested him. He said that he regarded William Lloyd Garrison as one of the most remarkable men that America had produced,* and he called my attention to an engraved portrait of the great

* Through the courtesy of Mr. W. P. Garrison of the New York "Nation," I have been permitted to make the following extracts from a letter written to him in English by Count Tolstoi under date of Moscow, March 25th, 1886:

"I have received your letter and the books you sent me. I thank you very much for both. To be informed of the existence of such a pure Christian personality as was your father has been a great joy to me. I have not yet had the time to read the whole book, but the Declaration of Non-Resistance, that I had looked over, is, in my opinion, an era in the history of humanity. This Declaration, as it has been composed nearly half a century ago, fully expresses the sentiments we pro-

fess now and which will be professed by the whole mankind, because they express God's eternal law unto men, revealed by Christ, and which is to be fulfilled. (Chap. V. 18 Matt.). . . . Does the Society of Non-Resistance exist yet? And where is its organ and who are its members? It is strange of me to make this last question; the Society of Non-Resistance is not an exceptional society, but is, in fact, the only church which was founded by Christ, and which never can end. My question properly means: Are there people who profess the true faith, and who boldly accuse the errors of false Christians who acknowledge Government, and violence which is inseparable with it?"

antislavery agitator which hung near the window in the room where we were sitting. He said he had sent to the United States for the biography of Garrison by Oliver Johnson, and had read it with great interest; but he thought the author had not given prominence enough to Garrison's views with regard to non-resistance, and had shown a disposition to treat them in a deprecatory way, as if they were something to be apologized for. In his (Count Tolstoi's) opinion, the fact that Garrison was, at one time at least, a non-resistant, did him more honor perhaps than any other fact in his history. The Count also spoke with warm respect and admiration of Theodore Parker, whose "Discourse of Matters Pertaining to Religion" he regarded as the most remarkable effort of the American mind in that field. In the course of further conversation he said he thought it deeply to be regretted that America had in two particulars proved false to her traditions.

"In what particulars?" I inquired.

"In the persecution of the Chinese and the Mormons," he replied. "You are crushing the Mormons by oppressive legislation, and you have forbidden Chinese immigration."

"But," I said, "have you ever heard what we have to say for ourselves upon these questions?"

"Perhaps not," he answered; "tell me."

I then proceeded to give him the most extreme anti-Chinese views that have ever prevailed upon the Pacific coast, and to draw as dark a picture as I could of the economic condition of a once prosperous and happy State "ruined by Chinese cheap labor."

"Well," he said when I had finished, "is that all?"

"All!" I exclaimed. "Isn't that enough? Suppose the Chinese should come to California at the rate of a hundred thousand a year; they would simply crush our civilization on the Pacific coast."

"Well," rejoined the Count coolly, "what of it? The Chinese have as much right there as you have."

"But would you not allow a people to protect itself against that sort of alien invasion?" I asked.

"Why alien?" said the Count. "Why do you make a distinction between foreigners and countrymen? To me all men are brothers, no matter whether they are Russians or Mexicans, Americans or Chinese."

"But suppose," I said, "that your Chinese brethren come across the sea in sufficient numbers to reduce you to slavery; you would probably object to that."

"Why should I?" rejoined the Count with quiet imperturbability. "Slavery is working for others — all I want is to work for others."

I abandoned the discussion. To argue with

a man who would not resist enslavement by a Chinese was as unprofitable as to discuss surgery with a man who would not admit the desirability of relieving suffering and saving life. I allowed the Mormon question to go by default. In fact, I did not see upon what ground I could defend anything against an antagonist who would neither give me standing room nor allow me to use any of the weapons in my armory.

Later in the evening something was said which brought up the subject of civil government, and that in turn led to a discussion of punishment in general and capital punishment in particular. Count Tolstoi, as might have been expected, was opposed to both, and in the course of the conversation he said that shortly after the assassination of Alexander II. and the trial and sentence of the assassins, he wrote a letter to the present Tsar, making an appeal in behalf of the condemned regicides, setting forth the wrongfulness of taking human life, even by due judicial process, and imploring the Tsar not to begin his reign with murder. He sent this letter by a friend to Pobedenostsef, the Procureur of the Holy Synod, who had been the tutor of Alexander III., and was supposed to have great influence over him, and besought Pobedenostsef to lay the letter before the Tsar with a favorable recommendation. He received from Pobedenostsef in reply what he described to me as "a terrible letter" [*uzhasnoe pismo*], in which the writer said that he approved of the death sentence pronounced upon the murderers of Alexander II., that he did not sympathize with appeals for mercy based upon such considerations as those which Count Tolstoi urged, and that he must therefore decline to bring the letter to the Tsar's attention. He closed by saying, "Your religion is a religion of weakness and sentimentality, but there is a religion of authority and power" [*sil i vlast*].

I could see by Count Tolstoi's manner while relating this incident that he had been deeply disappointed by the result of his intercession, though why he should have expected any other result it is hard to understand. The circumstance furnishes an illustration of what seems to me a weakness — or, if that word be too harsh, a peculiarity — which distinguishes Russian character as a whole, and which is to me one of the most noticeable features of the character and the philosophy of Count Tolstoi. I cannot think of any better word to describe that peculiarity than "childishness," although that word has also a depreciatory significance which renders it objectionable, and which I should like in this case to reject. I mean that the Russian, as a rule, has a childish faith in the practicability and the speedy

realization of plans, hopes, and schemes which an American, under precisely similar circumstances, would regard as visionary and quixotic, and would therefore throw aside as having no bearing on his present conduct. When this national trait is united, as it is in the Russian character, with a boundless capacity for self-sacrifice, it brings about results which, to the American mind, are simply bewildering and astonishing. This characteristic which I have called "childishness" is no less apparent in the reasoning and the activity of the Nihilists than in the doctrines and the eccentric practices of Count Tolstoi. It was as childish for the Nihilists to suppose that they could attain their objects by assassinating the Tsar as it was for Count Tolstoi to suppose that he could save them from punishment for that act by urging such considerations as the barbarity and sinfulness of the death penalty upon a government which had already shot or hanged fifteen or twenty men for political offenses of far less gravity. Both the Nihilists and Count Tolstoi answered affirmatively the question, "Is the object to be attained desirable?" and then both proceeded at once to act, regardless of the equally important question, "Is the proposed method practicable?" The Russian seems to throw himself with a sort of noble, generous, but childish enthusiasm into the most thorny path of self-denial and self-sacrifice, if he can only see, or think that he sees, the shining walls of his ideal golden city at the end of it. He takes no account of difficulties, heeds not the suggestions of prudence, cares not for the natural laws which limit his powers, but presses on, with a sublime confidence that he can reach the ideal city because he can see it so plainly, and because it is such a desirable city to reach. From Count Tolstoi, striving to bring about the millennium by working for others and sacrificing himself, down to the poor pilgrims by the roadside, striving to better their characters and atone for their sins by laborious pilgrimages to holy shrines, there is manifested this same national characteristic — the disposition to seek desirable ends by inadequate and impracticable methods.

I had had no favorable opportunity during the day to ascertain Count Tolstoi's views with regard to modern science, but late in the afternoon such an opportunity presented itself in the course of a discussion of heredity as a factor in social problems. I said it seemed to me that in considering the possibility of eradicating evil by altruistic conduct and non-resistance he did not give the facts of heredity enough weight. He replied that he did not believe in inherited total depravity, and that as for Darwinism he regarded it as a "great deception" [*bolshoi obman*].

"I do not pretend," he said, "to be well informed upon the subject of development; but I am told that a Russian scientist, named Danilefski, has written a book which will completely demolish the Darwinian theory." It was evident from this remark that Count Tolstoi had no adequate conception of the cumulative strength of the mass of evidence which now supports the theory of development, and I did not therefore pursue the subject. Callers soon afterward came in, and, although Count Tolstoi did not discontinue his shoemaking, the conversation soon became general, and was directed to subjects of local interest.

At 11 o'clock it became necessary for me to return to the railway station, and I bade good-bye, with sincere regret, to a man whom I had known only one day, but for whom I had already come to feel an almost affectionate respect. His theories of life and conduct seemed to me nobly, generously, and heroically wrong, but for the man himself I had, and could have, only the warmest respect and esteem.

It has of course been impossible, within the limits of such a paper as this, to give even the substance of a conversation which lasted many hours, and which ranged over the whole field of human conduct. I am conscious that in what I have written, from memory and from fragmentary notes, I have failed to do even partial justice to Count Tolstoi's arguments, to his eloquence, and to the deep, earnest sincerity which pervaded them, and which impressed me more than all else. I hope, however, that I have at least reported him fairly and understandingly.

Count Tolstoi is perhaps at the present time the most generally talked of and widely read author in Russia. His books and pamphlets circulate by tens of thousands among the educated classes, and by millions among the peasants; his theories of life are bitterly attacked and sometimes warmly defended in the Russian periodical press, and his religious ideas are discussed in the luxurious homes of the wealthy nobles and in the cottages of the peasants, and from the capital of the empire to the mines of Kara. The fifth collection of his works, in twelve volumes, has just been published in St. Petersburg, and up to July last there had been sold nearly three million copies of his tracts for the common people. What permanent effect, if any, his teaching and his example will have upon the course of events in Russia it is impossible as yet to predict. Thus far the results are unimportant, and the verdict of educated society is adverse to the philosopher and to his philosophy. I am not at all sure, however, that the results would long continue to be unimportant if the Government should allow Count Tolstoi's propagan-

da to get fairly under way. There is no doubt that his teachings are, to a certain extent, in harmony with the character of the Russian peasant; and that he spoke the simple truth when he said to me, "The muzhik is not naturally aggressive nor combative, but he is capable of passive resistance to an almost unlimited extent." Both of these facts are illustrated by the history of Russian dissent, and particularly by the springing up in various parts of the empire of such sects as the "Non-Tax-payers," the "Hiders," and the "Followers of Sutaief." All of these sects hold views closely analogous to those of Count Tolstoi, and they hold them with a tenacity which neither prison nor exile can conquer. Siberia is full of people who have been banished for religious heresies which they could not be persuaded nor forced to relinquish, and the number of dissenters in the empire is now about fourteen millions. If Count Tolstoi were allowed to sow the seeds of his doctrines broadcast in this fertile soil, it might possibly change to a very considerable extent the course of Russian history; but, as I have before said, he will not be permitted to do so. Nearly all of his later writings have been prohibited by the censor, in whole or in part, and if, notwithstanding these repressive measures, his religious heresy should gain adherents enough to make it dangerous, or even troublesome, to the state, it would be stamped out with imprisonment and exile, as scores of such dangerous heresies have been stamped out before.

The question most frequently put to me in St. Petersburg and Moscow after my return from Yasnaya Polyana was, "Did Count Tolstoi impress you as sincere and in earnest?" There seemed to be a prevalent belief that he was merely amusing himself with shoemaking, field-labor, and tract-writing, and that there was behind it all no real sincerity of conviction. In support of this belief it was urged that Count Tolstoi's practice did not in all respects accord with his preaching; that he pretended to regard his works of fiction as useless, if not pernicious, and yet superintended the publication of a fifth edition of them; and that he opposed private property and preached against money-getting, and yet continued to hold his estate and to take the proceeds from the sales of his books.

In reply to these attacks upon Count Tolstoi's sincerity it may be said that if there is any discrepancy between his preaching and his practice it arises from the fact that he is acting under restraint. It is an open secret in Russia that all of Count Tolstoi's family do not share his religious belief, and that in the attempt to put his ideas into practice he is

obliged to choose between two lines of conduct, each of which involves evil and suffering, not only to himself but to others. Under such circumstances he has chosen what seems to him the least wrong alternative, and has made his practice conform to his preaching just so far as he can without bringing upon himself and upon others a greater evil than that growing out of his admitted inconsistency. It is therefore ungenerous, if not unjust, to attack him upon this ground, since he is precluded by the very nature of the case from making any defense.

In an authorized interview recently published in a Russian journal, Count Tolstoi refers to this subject as follows, in language whose graphic idiomatic simplicity and vigor can only be suggested in a translation:

"People say to me, 'Well, Lef Nikolaivitch, as far as preaching goes, you preach; but how about your practice?' The question is a perfectly natural one; it is always put to me, and it always shuts my mouth. 'You preach,' it is said, 'but how do you live?' I can only reply that I do not preach — passionately as I desire to do so. I might preach through my actions, but my actions are bad. That which I say is not preaching; it is only my attempt to find out the meaning and the significance of life. People often say to me, 'If you think that there is no reasonable life outside the teachings of Christ, and if you love a reasonable life, why do you not fulfill the Christian precepts?' I am guilty and blameworthy and contemptible because I do not fulfill them; but at the same time I say,—not in justification, but in explanation, of my inconsistency,—Compare my previous life with the life I am now living, and you will see that I am trying to fulfill. I have not, it is true, fulfilled one eighty-thousandth part, and I am to blame for it; but it is not because I do not wish to fulfill all, but because I am unable. Teach me how to extricate myself from the meshes of temptation in which I am entangled,—help me,—and I will fulfill all. I wish and hope to do it even without help. Condemn me if you choose,—I do that myself,—but condemn *me*, and not the path which I am following, and which I point out to those who ask me where, in my opinion, the path is. If I know the road home, and if I go along it drunk, and staggering from side to side, does that prove that the road is not the right one? If it is not the right one, show me another. If I stagger and wander, come to my help, and support and guide me in the right path. Do not yourselves confuse and mislead me and then rejoice over it and cry, 'Look at him! He says he is going home, and he is floundering into the swamp!' You are not evil spirits from the swamp; you are also human beings, and you also are going home. You know that I am alone,—you know that I cannot wish or intend to go into the swamp,—then help me! My heart is breaking with despair because we have all lost the road; and while I struggle with all my strength to find it and keep in it, you, instead of pitying me when I go astray, cry triumphantly, 'See! He is in the swamp with us!'"

Never, it seems to me, was there written a simpler, franker, more sincere confession of inconsistency than this, and never was there a more eloquent and touching appeal for sympathy, encouragement, and support.

George Kennan.

SONGS OF THE SEA.

POSEIDON.

METHOUGHT I wandered through those caverns dim
Beneath the Adriatic,—sea-girt halls
Where ocean's sceptered monarch, stern and grim,
Sits on his throne, beneath the crystal walls ;
Forever all that mighty palace hums
With the sea's voice, its dull, reverberant knell
Sounds through the passages, as from a shell
Pressed to the listening ear a murmur comes.
Through those vast halls for many a spacious hour
I walked, methought, till, on a sudden, lo,
Harsh thunder, and, anon, the sea-god's car
Blazing with light, and on its seat of power,
Poseidon, angry-eyed, with bodeful brow,
Rode through the gloom of ocean, summoned far.

SUNRISE AT SEA.

HOW soft a light from yonder east is thrown
Across this waste of sea, Saturnian,
A glow as tender as when time began ;
Though here there is no other creature known,
Save deep blue sea and deep blue sky alone,
And the rain-burdened clouds' slow caravan,
The sea and sky, forgetful here of man,
Talk each to each in measured monotone.
Once in the year a stray ship passes by —
Still presses on the multitudinous host
Of billows, dark beneath the lonely sky,
Summoned ere night to bathe some distant coast.
Thus o'er earth's desert places, eve and morn,
From the pale lips of heaven, God's smile is borne.

THE SEA'S VOICE.

I.

AROUND the rocky headlands, far and near,
The wakened ocean murmured with dull tongue,
Till all the coast's mysterious caverns rung
With the waves' voice, barbaric, hoarse and drear.
Within this distant valley, with rapt ear,
I listened, thrilled, as though a spirit sung,
Or some gray god, as when the world was young,
Moaned to his fellow, mad with rage or fear.
Thus in the dark, ere the first dawn, methought,
The sea's deep roar and sullen surge and shock
Broke the long silence of eternity,
And echoed from the summits where God wrought,
Building the world, and ploughing the steep rock
With ploughs of ice-hills harnessed to the sea.

II.

The sea is never quiet, east and west,
 The nations hear it, like the voice of fate,
 Within vast shores its strife makes desolate,
 Still murmuring, 'mid storms that to its breast
 Return, as eagles screaming to their nest.
 Is it the voice of worlds and isles that wait,
 While old earth crumbles to eternal rest,
 Or some hoar monster calling to his mate?
 O ye, that hear it moan about the shore,
 Be still and listen! that loud voice hath sung,
 Where mountains rise, where desert sands are blown;
 And when man's voice is dumb, forevermore
 'Twill murmur on, its craggy shores among,
 Singing of gods, and nations overthrown.

THE WIND AND THE STARS AND THE SEA.

THE wind and the stars and the sea.
 What song can be sung of these three,
 With words that are written in lines?
 Ah, God of the stars and the sea,
 The voice of the song, it should be
 The voice of the wind in the pines.

The voice of the song, it should be
 The voice of the coast of the sea,
 Stepmother and wrecker of ships;
 As deep and as hoarse as the tune
 Black Labrador sings to the moon,
 With rocky and cavernous lips.

The wind and the stars and the sea,
 The Arctic night knoweth the three;
 No other sojourner it hath,
 Save death and these three from of old,
 To whose abode throned in the cold,
 No living thing knoweth the path.

There nothing to grieve or rejoice
 E'er lifts up the sound of its voice —
 A world ere the birth of a soul;
 A thousand long ages speed by,
 Still glimmer the stars in the sky,
 Still whistles the gale from the Pole.

Amid the unharvested plains,
 The blossomless land where death reigns,
 The wind sings of doom and of graves:
 It sings of the days when the world
 Shall crumble to sand, and be whirled
 Like dust in the teeth of the waves.

Where ice-mountains thunder and crash,
 Where frozen waves gurgle and dash,
 Where love never came with its tears
 Like a lost world's desolate cry,
 Shrills sea-wind to sea and to sky,
 And only the ear of God hears.

William Prescott Foster.

EDUCATION AND SOCIAL PROGRESS.

"There is nothing great in this world but man, and nothing great in man but mind."—*Sir William Hamilton.*

HERE is a certain exhilaration of thought in America — compounded perhaps of our dry, stimulating air, our sense of achievement as a nation, the rapidity and multiplicity of our inventions, and the increase of wealth — that induces the belief that we are on the true highway of progress, and that nothing can prevent us from reaching the goal of social perfection. If the average American sentiment on this subject were reduced to a single voice and note, it would be a whoop of satisfaction at having emerged from the woods in which humanity has hitherto wandered, and of confident exultation in having found a straight path in an open country to the celestial city — whatever the conception of that may be. I propose that we separate ourselves from these worthy fellow-citizens who draw their data from the factories and the prairies, the newspapers and the halls of Congress, and endeavor to throw a somewhat broader light upon the subject. It is possible that history, philosophy, and a study of man himself have more to say upon the question of human progress than any of its chance phases or the voices of the present moment.

It is quite true that the conviction of a steady advancement of humanity toward an ideal of perfection has gained nearly universal lodgment in the modern mind, but the grounds of it are little understood. In the religious world it is based on the bare word of Revelation, without much intelligent conception of the process, and is lifted into the clouds of ecstatic vision; it is not, however, false nor in vain. In the world of semi-philosophy it is chiefly based on the signs of the times, which is somewhat like sailing by the winds instead of the stars. In the world at large it is based on material changes, with little heed of the fact that even adamant crumbles. The idea of human progress toward the goal of an ideal perfection is of recent origin. Always latent, perhaps, in the inmost recesses of man's nature, it has entered but feebly into his thoughts, is distinctly absent from the great minds except in rare cases, and only within a century has it found full expression in philosophy, where alone it has intellectual justification. But even here it is a modern idea, and so far

as it rests on facts it may possibly have too brief a history to justify its conclusion. Kant and Hegel and Lessing formulated theories of history — substantially alike — that point to the perfection of human society; but in doing so, they not only ran counter to the ordinary thought of men but to the habitual expression of the greatest minds. The highest forms of human thought are the epic poem and the tragedy; but the epic is always based on a remote age, and is a picture of past and faded glory. Eden is at the beginning, and all after it is lapse; the heroic period lies far back; the gods mingled with men in remote ages, and Olympus is now vacant; glory and virtue and achievement are found in early days that have passed not to return. It is easy to set this down to reverence, and to the demand made by imaginative genius for a clear field; but underneath such play of the mind there may be detected the conviction that the present is less worthy than the past. So in tragedy, which always turns on failure to cope with circumstances, man goes down under evil and the pressure of the forces of nature. The accord yielded to tragedy as the height of human expression is not merely literary and artistic, except as art is regarded as truth, but is granted because it is a true picture of human life. We refuse to accept tragedy unless it is thoroughly tragical; and again not for artistic reasons, but because we demand the truth of life. When a writer in tragic fiction softens his conclusion, and *Hamlet* lives, or *Lear* regains his crown, or when he carries the good and the evil along his pages side by side — the history of each involved in that of the other — and at the close draws a separating line between good and evil fortune, we pronounce it weak and untrue to life. It may not be untrue to spiritual faith, but it does not describe the course of things in this world. The tragedy that involves the noble *Hamlet*, the pure *Ophelia*, the weak *Polonius*, and the criminal *King* and *Queen* brings all to a common ruin. High intention and sweet innocence cannot disentangle themselves from the net of evil in which they are inevitably caught. Dante made Virgil his leader and master, but the world reverses the relation and sets the somber and awful critic above the amiable Mantuan. The theology of Milton, like his cosmology, has passed away, but his great epic stands not

because of the dignity of his verse, but through the tremendous sense of evil wrought into it, and which is still felt to be real. The hold that such authors as Juvenal and Lucian and Rabelais and Swift retain is not due to the keenness of their wit, but to their truthfulness; and Thackeray is accorded a more stable place in literature than is given to Dickens, because he goes deeper into the heart of society,—one depicts evil institutions; the other shows us the weakness of humanity itself, and we sadly acquiesce in his impeachment. So it is not the weird skill of Hawthorne that puts him at the head of modern writers of fiction, but the searching light in which he sets the forces of evil as they move on to inevitable doom.

The vital and enduring books do not blur virtue, but they do not present it as surely triumphant. I do not refer to the Sacred Books, into which a higher set of truths enter and where we find the story of human life drawn out at fuller length, but to the literature of this present world. We find, indeed, in all great books hope, and a deep sense that virtue will be crowned; but these hopes and convictions are subordinated to the sternness, the apparent vanity, the weakness of human life. They are subdued in their tone; if they exult, it is with a cadence or hint of question, and often the triumph comes after the failure—with funereal pomp and amidst the scenery of another world. It is the chorus of spirits that sounds the notes of cheer while Ate and Nemesis weave the body of the play. My point is this: that we do not find in the greater forms of thought that certainty of a good outcome for man, either as an individual or collectively, that we gather from the voices of the day.

The reasons for this somewhat doubtful look at the future of humanity—found in the great masters of thought—spring out of their profound sense of the weakness and frailty of man. They saw him invested by powers with which he cannot cope; these powers are inexorable and continue while man passes away before them. They also recognized the reality of evil, involving a doom not to be escaped, and linking generations together with cumulative force and increasing certainty of penalty. Regarding man as a frail being who rises, flourishes, decays, and passes away, and society as a macrocosm of which man is the typical microcosm, they assigned to them a common fate. A nation might flourish and come to glory, but it must decay as man does. They saw also a tendency in history to repeat itself; and the history of no nation, in its external aspect, justifies the hope of permanent perfection. They saw that the very conditions of progress in prosperity and wealth involve pride and presumption and self-indulgence that end in ruin;—the theme of

serious comedy and of the great moralists. They saw that as the life of man and of society grows complex, it outmasters human wit and that defeat steals in through one of the many doors;—the theme of tragedy, and the source by reaction of idyllic poetry that praises simplicity. They were governed also by a still profounder influence: they saw man involved in nature—drawn from its bosom, under its laws, conformed to it in the order of his life—and in nature they found no real progress, but only a round and a return to the starting-point; they found in it only fixed laws—a necessity that admitted a brief play of seemingly free powers, but ended the process in inexorable doom. Man is no exception and, however far he may go or high he may reach, he is still moving in a circle of destiny, and must at last lie down in the weakness and silence of death.

Such have been the governing thoughts of the great thinkers. Plato built an ideal republic, but confessed that it must at last perish under the frailty of human nature. Idealist as he was, he did not distinguish between the life of the individual and the corporate life of society; man was humanity.

These prevailing conceptions are not to be disregarded. The opposite, or rather correcting, conceptions have not yet found secure recognition. Freedom is not yet established above necessity, and will not be so long as we cherish a material and agnostic philosophy, and regard freedom as a thing to be conveniently taken for granted though all the facts are interpreted to the contrary. The question if man be not wholly involved in nature and its laws, is the Hougoumont of the Waterloo that is now raging in philosophy; if won by the materialist, this age at least will see no progress beyond rapid material changes, and the main question will be to reduce friction to the lowest possible degree,—that is, to extract from nature's grasp and get into our own the greatest possible amount of force,—force being all we know or have to deal with.

The idea that humanity may have a destiny that is not typified in the individual, that history has a philosophy which is not wholly identical with the worldly experience of man, is yet a mere theory. The old and strongly presumptive idea that society is the macrocosm of which man is the microcosm is not yet separated into its proper proportions of truth and error. Thought still gravitates—and with profoundest reasons—toward man's consciousness of himself as a subject-being in the world, depicted perhaps nowhere so well as in Job, the Greek Plays, Hamlet, and the writings of Pascal, and it rises with difficulty into the late-dawning conceptions of his dominion and ability to conquer circumstance and to build himself

and society into enduring forms. There is no more wholesome and needful lesson for this presumptuous age to learn than that its disposition and ruling thought do not accord with the largest thought of the world. We find in the wisest of men a common and steady disposition to glorify the past, to criticise the present, and to distrust the future; — these three things men trained in the school of human life always have done, and will continue to do. Instinctive habits like these have a rational basis. The shallow critic says that to glorify the past is weak and untrue; to criticise the present is morbid; to distrust the future is cowardly. But still the poets will go on singing the praises of the past, glorifying the conquest of Canaan and not the last brush with the Philistines, King Arthur and not the campaign of the Soudan; the moralists will still lay their rough hands upon the present order; the wise and far-sighted will still look anxiously into the future and listen to their own thoughts rather than to the Fourth-of-July orators. These instinctive tendencies are capable of a high interpretation and have a profound use that quite outweighs any seeming inaccuracy of thought. It would be a misfortune if men did not think in these ways. Our sense of the past is made what it is in order to strengthen our hold upon good already achieved; our criticism of the present is a perpetual judgment-throne by which the evil is separated from the good; our distrust of the future is the expression of the conscious weakness of man and of his proneness to err — the echo in our hearts of his repeated history on the earth; it is the wise humility of man as conscious of himself; it makes him cautious, careful, vigilant. It is well and even necessary to believe in progress and to hope for it, but checks are put upon thought and hope lest they breed overconfidence and vain presumption. The goal of progress is first to be discovered, and then reached by achievement. The things to be done before it is gained are many and great, and can only be wrought in humility and faith and "sad sincerity."

Under such thoughts, let us raise the question whether much that is now deemed progress is really such, or, indeed, enters at all into a true conception of progress; whether, in fact, the changes that are called by this name are not a part of the old round of vanity through which men have walked from the beginning. Change, and that chiefly of a material sort, is the chief feature of the present conception of progress; and the process is one of friendly conflict with nature — to get power away from her into our own hands. As nature is now reduced mostly to force, the conflict is mainly at this point,—

to reduce friction, and use leverage with the greatest advantage. Hence the multiplicity of our inventions and their wide application to life — all designed to get this force of nature at work for us with the least expenditure of our own force, or with an expenditure only of brain-force. I do not say that this is not the very thing that man ought to do,—a chief part of his present vocation in the world. But let him remember meanwhile that he is simply toiling in the round of nature, and that what man wrests from nature will be reclaimed by it unless it is firmly held in the grasp of his moral and spiritual nature, and lodged in a higher and more retentive world; if not, the jealous fingers of nature will reach after its stolen force and draw it back into itself. A patent cut-off is not secure because it lies in the archives of the Capital and is described in a book; it is safe and permanent only as it is cherished by men who hold a true theory of the philosophy of human life; and this philosophy is not one of mere use and convenience, but is something far higher and has a different purpose. Progress in this world of mechanical achievement is not progress except as it is associated with and presided over by certain very rigid forces known as moral and spiritual. This progress has not in itself the slightest power to advance mankind an inch toward its proper destiny. It may be indeed the revolution of the car-wheel that bears the traveler on, but it is not the force that carries him. If we sink ourselves in nature, and turn life into a use of mechanical forces, nature will outwit us, and steal back the Promethean fire.

There would be no need of words of criticism and caution before the great achievements of physical science, if it were not for the fact that prevailing philosophy and conception favor, and play into, and simply interpret this material life. The steam-engine is something to be thankful for, but when the philosophy of human life is made one with the expansion of steam, fierce explosion or unresisting coöperation may be anticipated. I assume as unquestionable the prevalence of a materialistic and agnostic philosophy — the one because it is the other — seen everywhere, seen more in the life and conversation of men than in books, and yet literature is full of it,— running out into pessimism on one side and into an easy optimism on the other. I refer to it only to direct attention to the fact that, coincident with its prevalence, no apparent progress is being made in the higher lines of life as revealed in art and literature; and also to the fact of a diversion from the true methods and ends of education.

Without attempting to play the connois-

seur in art, I venture to say that its chief motive at present is to represent French peasants in the greatest possible variety of natural attitudes — admirable work and quite worthy of being done as a by-play, and sometimes, as in Millet, rising into the religious; but where are the pictures that set the blood on fire with noble purpose, or haunt the mind with their mysterious suggestion of eternal truth? What canvas now breathes inspiration? Where are the marbles that are gods to us in their awful purity and power? What great musical composition has been produced since the phrase *agitation* came into use? I acknowledge the power of the Wagnerian compositions, but it is the power of nature, and not of the spirit. Music is by far the most significant and revealing of the arts. No electrometer is more sensitive than is music in its revelation of the character and scope of human thought; and what is present composition revealing? Harmony, sweet and intricate enough, but "the diapason closing full in man" we seldom hear from the modern composer, and our hungry hearts turn back to the men of old for the inspirations without which we cannot live. We miss in art nobility, breadth, power, inspiration, and find instead infinite carefulness and skill — a perfect transcript of nature, but it is a direct transcript; the paper is laid upon nature, and its forms are traced through. But if this is art, why is not the image of nature on the retina of the eye as good? We can all look for ourselves and take the skill for granted. I assume that there is no true art but such as passes through the brain and heart of man, and that it becomes art because the man sees and feels the meaning of nature. But if nature is regarded simply as a play of mechanical forces, a mere arrangement of parts, art will only express so much. If no other idea is seen in nature, no other idea will be seen in the marble or on the canvas, or heard in the music.

Passing to literature, we find books in abundance and none too many. Never were there so good books in special departments, — as theology, natural science, philosophy, history, social economy, medicine, and jurisprudence. But when we come to that form of literature where genius has play, — the literature in which the author is the interpreter of society, hears its voices, catches and repeats its spirit, — we are forced to confess that within twenty years we detect not only a loss of power but of the secret of power. The fault is subtle but real, hard to detect, but proved by the fact that one seldom reads a novel of the day twice, or gathers the present fiction on one's shelves, or quotes from it; no one dreams of calling it classic. Yet it is admirable work in many ways — carefully wrought, excellent in style,

and, it must be confessed, true in a certain way to human nature. The American girl and business man blush with shame as they turn the truthful pages, but — and here is the test — they are not converted; and for the simple reason that the author simply describes them and does not appeal to them. He is no more earnest and high-minded than they are, and takes about the same view of life, with only some variation of taste and fitness. At bottom they believe in nearly the same things; both reflect the age and its spirit, — an age of outsides, of phenomena and presentments, provincial in time while cosmopolitan in tone, a sectional age without beginning or end, without cause why or end whither, without basis in eternity or sense of eternal truths — the reflection, in short, of a materialistic philosophy and, by consequence, devoid of faith and so driven to a mere use of the world. If the universe, man and society included, is a mere play of mechanical forces, all we have to do is to watch the forces as they unfold under inexorable necessity. And this is what literature seems to be doing under the phrase *Realism*. Realistic it is, but it is an external realism, photographic, without personal conviction. The characters described are pen-pictures and not brain and heart creations. Hence they do not greatly interest us, nor do they move us at all. If we look to literature for signs of progress, we do not find them. The poets are gray-headed, and the novelists whose imaginary characters are vital beings in the world of fancy are no more. Or if now and then some rare and sweet pages stay in our minds and breed noble suggestions, they come from those who have not been caught by the pervasive spirit of materialism. It may seem that I exaggerate the influence of this spirit; but I need only to say in vindication that the philosophy of an age governs its thought, shapes its life, and expresses itself in its art and literature. The world — wisely so, without doubt — is homogeneous in its thought, and may be trusted to be steadily working out some good end. Just now it is making a détour from the grand highway of progress into a by-path of materialism, led by philosophers who are very sure that if they can master matter they have compassed the universe; — a détour quite well to make if only to find out, as we are beginning to do, that matter is nothing but points of force, — a détour quite well to make if it leaves us with enough humility to send us back to the highway where philosophy still lingers, and humbly to inquire of it what force is. Return we shall from this Egyptian sojourn and bring away much valuable information, but we shall leave behind us most of the art and literature wrought there.

I deprecate the suspicion that I am about to plunge into the depths of pessimism, as I go on to question if certain changes in methods of education are in the line of true progress, and also to trace in bodies of scholars something of this same materialistic taint of which I have spoken.

I do not purpose to enter upon the vexed question of the study of Greek, but will only say that so long as the study of Greek is confined to the grammar, without reference to the literature and philosophy of the Greek plays, its utility will be doubted. It would be so with Hamlet were it used simply as an exercise in syntax. I refer instead to a tendency to specialization in study, with a strong lurch toward physics, and to certain methods becoming common that leave out the chief factor in education; namely, the inspiring presence and power of the teacher.

First, a preliminary word. It is vain to resist the call of the age as to the kind of trained men it requires. If mines are to be opened and worked, miners must be educated. It is also difficult to resist the spirit of the age, and to give to education any other complexion than that reflected by the times. One university falls in, and its crowded halls compel the rest to follow,—not stopping to consider that this is a reversal of the relations between the university and the people. When an age says, "We do not want ethics, we want science," ethics is the very thing it most needs. It would be well if the universities were strong enough to say, "Ethics you shall have or nothing"; and the answer would be rational, for, however it may be with the individuals who require the opening of mines and the refining of petroleum, society requires a science that is grounded in ethics and philosophy, since in these lie its destiny.

It requires no very keen eye to perceive that a materialistic philosophy has laid its grasp upon education and is dragging it toward itself and setting it at work in its vain round. Things and their uses, physical laws and their methods, the transmutation of substances,—such are the things of which the age thinks, and its demand upon the university is, "Give us the men who will serve in these ways." Little fault is to be found with the age—it is doing what it is set to do—nor with its demand for trained men to aid it, but surely it should be left with the university to decide upon the kind and method of training, and to reserve for itself that judicial estimate of the needs of society that belongs to it by virtue of its nature as an educator. It will never become untrue, though it may be for a time forgotten, that a broadly trained man is worth more to society than one trained as a specialist. Nor

will it ever cease to be true that no man is well trained for the uses of society who is not trained in philosophy, in ethics, in social science, and in the humanities. Nor will it ever fail to be true that education is nine parts inspiration and one part drill; or stating it otherwise, that the chief factor in education is the teacher; that being given, the study, as it is called, may easily be arranged as to its details.

I do not deny that great improvements have been made in education since some of us were catechised—often with woful results—on the grammar of Homer without so much as being told that Homer was a great poet, much less wherein his greatness consisted. Personally, I may say, I supposed while in college that Homer was read because he bore out the assertions of the Greek grammar. To get the *Iliad* under the grinding heel of the grammar was my vain struggle and the only effort required of me; but the shout of Achilles as it rang over the wind-swept plains of Ilium—that I never heard; the Castalian fount—I learned its topography, but I never drank from it; the muses—I knew their names, but their mystic dance I never traced! It is somewhat different in these later days, and now a student is informed of the distinctive characteristics of *Æschylus* and *Sophocles* and *Euripides*.

But with all the improvements there is a tendency to specialization that looks away from the ideal of education, so that we are getting admirably informed men instead of comprehensive thinkers,—that is, servants and tools of society instead of its masters and guides. When a university gives to society a trained man who can develop a mine, or remove crops according to the best rule of economics, it renders a certain valuable service; but unless it has also trained this man to think on the question, What is a mine for? or, What is the relation of crops to social welfare? it has not met its vocation as an educator. It is to be doubted, therefore, if this tendency to specialization—favored and fed by an elective system—is genuine progress. It seems rather a servile play into the hands of a clamorous age bent on securing the greatest possible amount of material change. The age cries, "Teach us how to get a living,"—a cry to which the university should pay but little heed, heeding instead the profounder call that issues from all the ages and from the deep heart of humanity itself, "Teach us how to live!" To think, to reason, to feel nobly, to see the relations of things, to put the ages together in their grand progress, to trace causes, to prophesy results, to discern the sources of power, to find true beginnings instead of unknowable causes, to perceive the

moral as governing the intellectual and both as dominating the material, to discern the lines along which humanity is moving and distinguish them from the eddies of the day,—such is the end of education. To provide society with the greatest number of specially trained workers in special fields is to turn the university into a shop.

Again, admitting great improvements in education, I question if the change of relation between teacher and pupil is in the line of true progress. Heaven forbid that the relation of the past should be reestablished. If there is a nightmare of youthful recollection that the years fail to dispel, it is the vision of a college tutor of thirty years ago. While the chilling dignity and antipodal distance have largely passed away, there is distance of another sort, and a tendency to methods that defeat the end of the relation. I refer to the increasing tendency to rely upon examinations and the consequent separation between teacher and pupil. More and more is the examination used to test proficiency,—frequent, searching, thorough, if a student passes he is considered educated. And so he is, if education is a drill instead of an inspiration; if education consists in a knowledge of text-books, and not in the instruction of a living man. I protest against turning education either into a martinet process or a frequently recurring judgment-day. The main, I might almost say the entire, feature of education is the sympathetic and inspiring contact of a fit teacher with young minds. So a lioness trains her whelps; so a mother rears her children; so Socrates and Dr. Arnold educated young men. The tendency to throw the student upon the text-book and to test him by examinations is a departure from education just in the degree it removes him from a fit teacher. I grant it is the proper method if the only object of education is to provide capitalists with trained servants for opening their mines and mixing their chemicals. But if the object of education is to secure men who shall think for capitalists and dominate them by the logic of a sound and lofty philosophy, and to inspire society with high conceptions of character and conduct, then the present tendency is not in the right direction. Such education is not gained except by personal inspiration, through personal contact. The imparted spirit in education, as in the church, is by the laying on of hands. That is a fine passage of Plato's in which he speaks of "the gentle and pleasant and approving manner in which Socrates regarded the words of the young men," and goes on to say in the words of Phædo.—"I was close to Socrates, on his right hand, seated on a sort of a stool, and he on a couch which

was a good deal higher. Now he had a way of playing with my hair, and then he smoothed my head, and pressed the hair upon my neck, and said 'to-morrow, Phædo, I suppose that these fair locks of yours will be severed'; for Phædo was under a vow. Here is a teacher who repeats and perpetuates himself in his pupil. I am not pleading for the old recitation-room with its perfunctory drill and childish marking system, but instead, for a free, full, confiding, and almost constant intercourse between pupil and teacher. The main point in education is the teacher. The tendency at present is to select him because of his proficiency in his department, with less and less disposition to regard any other qualifications. Give us for a teacher in our college the best mathematician or linguist or chemist,—such is the demand, with small inquiry on other points. Does he believe anything? has he a heart? is he capable of human emotions? has he the wit of insight? is he noble, brave, large, aspiring, devoted, reverent? These are minor, omitted considerations. And indeed, if education is a drill, and examinations do the work, and if the aim is to provide servants for capitalists, these things are quite superfluous. I do not deny before practical educators, who are often shut off from pursuing their own better ideals, the wisdom of the examination. It is a practical world we are in, and education is a thing of methods; but to erect the examination into a test and main feature of education, turning, as it does, chiefly upon knowledge of the text-book, is to take away from it what I will call its *human* element. The examination may be necessary under the system and in view of the end now held up, but it is not a lovely spectacle, preceded, as it is, by a process the name of which is an indignity and a condemnation—*cramming*. On what principle of education can such a process be justified? But it is recognized and almost called for by the present methods. If familiarity with the text-books is the main thing, and examinations are the test, cramming is the sure correlate and is even invited. And so a hundred well-crammed students meet a teacher who does not greatly alter his function or character in becoming a detective of deftly concealed formulæ and tough passages, tucked in the sleeves and otherwise hid as if by a Chinese card-player. Indeed, the whole affair is Chinese,—formal, childish, soulless. When education turns upon and is determined by an examination instead of daily and almost hourly contact with a wise, sympathetic, inspiring teacher, it provokes these irrational methods and defeats itself at every point. It has not even the excellencies of the military drill, for a soldier learns the manual however unwillingly he goes through it, but a

student left largely with his text-book — the teacher a rarely appearing phantom except at examinations, where he sits clothed in the black robes of Rhadamanthus to determine if the cramming has been sufficient,—this is neither drill nor education, but is rather akin to the commercial processes in which the young men will soon be engaged—a process of rapid inflation and soon following disgorge-ment. It is no surprise that athletics are the inspiring theme in our colleges, when the possible finer enthusiasms are quenched by such methods as these.

It is the first duty of scholars to lift themselves above their age and to search it with judicial scrutiny. If there is weakness or fault or faulty tendency, it is their business to detect it. No man can or should separate himself from his age; least of all should the scholar seek such isolation—either in the past, sighing for that which cannot come again, or in the future, longing for that which cannot yet come. But while the scholar should preëminently live in his age and even yield to it in a measure,—remembering that it is a step in the march of the Eternal Providence,—it should be in a way far different from that of the masses who always sink themselves in their age, and conceive of progress only as an ultimate of the present idea or force. What thought to-day has place in the American mind beyond that of developing its physical resources? The scholar should recognize this, but he should also recognize far more. He should see that material progress is but traveling in the old round of vanity whose sure phases have been fixed over and over again in history. He should see that the masses require higher conceptions than they assume for themselves; that while they do the immediate work of their day, they should be led and stimulated in the harder and loftier lessons of life. As a scholar he should understand that his vocation is to labor for those great, corrective principles of truth and virtue and reason that men do not readily heed and obey. Hence, there is no sadder sight than that of education bending and shaping itself to the demands of a low utilitarianism. When the university departs from its vocation of rearing scholars who shall think for the age and guide its thought and lead it to act on solid principles, and instead furnishes a set of specialists to do the intellectual drudgery of the day, it falls away from the line of true progress; this is not an advance, but a capitulation. Specialists there must be; physical science must have full and due regard; every page of the book of nature must be turned, but let these specialists and students of science be also scholars who have been taught in the broader schools of

philosophy and of humanity, for in these are found the secret laws that determine social destiny.

The chief aim of the American university at present should be to produce scholars who shall be able to see the full significance of the idea that lies at the foundations of the American nation and in the fulfillment of which runs the true line of its progress. I refer to the democratic idea—or, as plainly stated by Mr. Lowell, democracy, stated by him with epigrammatic insight, but drawn out into philosophical fullness, traced to its divine origin, set in its historic relations, and applied to the details and institutions of our government by Dr. Mulford, in his work — “The Nation.” It has so happened that, for the first time in the world, this democratic idea with its associate idea of federation has been wrought into national form on this continent. Christianity, the doctrine of evolution when properly interpreted, and history have yielded a practical, working form of this idea. Christianity teaches nothing unless it teaches the self-sovereignty of man. Evolution crowns its process with man who acts in freedom and holds his destiny in his own hands. History ends its records of struggle with tyranny in a nation that at last is actually governing itself. From these three conspiring and coöperative sources do we get what I have called the democratic and federative idea, and now hold it in actual realization. In the perfecting of it lie the destinies of the nation, and through it runs the line of progress. The apostle of this idea is the scholar, for he alone can take in its immense significance and direct its fulfillment. This idea must be accepted and held and applied in the light of its sources.

The irrefragable proof, the persistent life, the power of Christianity, lie in the fact that in its very nature and substance it is composed of this idea of self-sovereignty; it is the gift of Christianity to the social life of humanity. I am quite aware that Christianity has not been so apprehended, but when it is delivered from ecclesiasticism on one side and from dogmatism on the other—as is fast being done—the world will behold in it a philosophy of human society that it cannot fail to accept. The doctrine of evolution as it is now coming to be interpreted by philosophy, is a deliverance from that sense of necessity which has brooded over humanity from the beginning—the adumbration of the nature from which man has hardly yet escaped and a birth into freedom and self-sovereignty. History, as the record of ethnology, jurisprudence, and institutions, illustrates the steps by which the great purpose of the ages has advanced toward its ideal of man as a self-governing being.

We do not as a nation yet apprehend the peculiar and wholly exceptional position that we occupy. As one who stands in the sun may be in darkness, so we look at this wondrous spectacle of a nation ideal in its structure, divine in its conception, the perfect fruit of evolving history, in a dull, matter-of-fact way, and we take Mr. Matthew Arnold at his word when he tells us that we *happen* to have good institutions! Even so the solar system happens to be orderly and stable; so a tree happens to yield fruit. Mr. Arnold is quite well pleased with our institutions, and thinks his England would do well to adopt them. Were he the critic he might be, he would lash us with scorn for our dullness before the meaning of our institutions. For the democratic idea supplemented by federation, and realized in a nation and a history such as ours, is an absolute novelty in the annals of the world. It is as truly the necessary and foreordained outcome of the history of humanity as the birth of a child is the product of gestation. The democratic idea, or self-sovereignty, is the eternal and absolute principle of government; the principle of federation is that which renders it practicable—its clothing body, not, as Mr. Arnold says, its clothes, but its vital, working organism. Sir Henry Maine and Mr. Scherer tell us that "democracy is only a form of government,"—so difficult is it even for great men to apprehend the secret of history and the nature of man. Democracy worked by the federative principle is the exact solution that a pure reason would have worked out at the beginning, having at hand the contents of human nature. It stands in exactly the same relation to government in which man stands to the process of development,—the purposed end, the perfect, fixed product of the whole process.

This ideal of a nation is being realized on this continent. Many have stood on Pisgah and viewed the promised land, but our feet press its borders, and our lips taste its clusters.

Here, then, in the development of this ideal, lie the lines of progress; here is the field of the American scholar; here is the vocation of the American university. Its main question should be, How shall it train its men so as to best fit them to conduct and develop this mighty enterprise of a self-governing, federated nation?

The question nearly answers itself,—first, by a spontaneous negative; not by training men in special ways for the special errands of material industry, for the destinies of the nation do not lie there. It must educate its men through those studies in which there is revealed the sources of our national life, and still more in those studies that reveal its principles, and must guide their development and application to society. This nation is founded in the nature of man, and hence man must be studied, and not merely as an animal, but also as a moral being. This nation is founded on morals, and on hardly anything else; it rests on morals and feeds on morals, nor does it live by any other bread; hence the university should teach ethics. This nation is an evolution of human history; hence the university should teach history in its broad sense, ethnology, institutions, religions, environments, events, indeed, but as related to causes. The age is analytic; the university should be synthetic.

In brief, the chief aim of the university should be to send out men who are thoroughly grounded in the philosophy of the nation, who understand the depths from which it has been drawn, and the secret forces by which it may be guided. Its work lies aside from the tendency to specialization and skill in material lines, and looks toward those broad studies that may be summed up as philosophy.

To know man, to understand society, to serve the nation with self-sacrificing intelligence,—this is the vocation of the scholar; and the university must heed the requirement to educate him accordingly.

T. T. Munger.

SOLITUDE.

I LOVE thee, O thou Beautiful and Strong,
Invisible comrade, mute, sweet company,
More dear than friend or lover! But to thee
My fondest hopes, my fairest dreams belong
Forevermore! Amid the world's gay throng
I yearn for thy soft arms that lovingly
Soothe all the fevered wounds once fretting me.
At thy deep heart there springs the fount of song
Whose drops shall cool my burning lips athirst,—
At thy swift beck within my sight arise,
(Their bonds of silence and dim darkness burst,)
All my beloved dead, with shining eyes,—
At thy blest hand, by starlit paths untrod,
My soul draws near unto the face of God!

SILENCE.

AY, and thee, too, who wield'st a power divine,
Greater than loudest speech or fairest lay!
The dead, millions on millions, own thy sway,
In realms where suns to rise no more, decline.
Thine is the lover's sweetest rapture, thine
The deepest cup of grief or joy, that aye
The lips of mortal tasted, thine — yet stay
How may I name thee, with what sound so fine
It shall not snap thy life's frail, golden thread?
O Solitude and Silence, bid me learn
A little of your greatness! Long are fled
The lesser gods of life, now let me turn
To ye alone, to ye in worship come,
The accents of this faltering tongue grown dumb!

Stuart Sterne.

AFTER READING SHAKSPERE.

BLITHE Fancy lightly builds with airy hands
Or on the edges of the darkness peers,
Breathless and frightened at the Voice she hears:
Imagination (lo! the sky expands)
Travels the blue arch and Cimmerian sands,—
Homeless on earth, the pilgrim of the spheres,
The rush of light before the hurrying years,
The Voice that cries in unfamiliar lands.

Men weigh the moons that flood with eerie light
The dusky vales of Saturn — wood and stream
But who shall follow on the awful sweep
Of Neptune through the dim and dreadful deep?
Onward he wanders in the unknown night,
And we are shadows moving in a dream.

Charles Edwin Markham.

TOILET TAKEN IN 1864. (SEE MAP, PAGE 279.)

FROM THE WILDERNESS TO COLD HARBOR.

ON the 2d of May, 1864, a group of officers stood at the Confederate signal station on Clark's Mountain, Virginia, south of the Rapidan, and examined closely through their field glasses the position of the Fed-

eral army then lying north of the river in Culpeper county. The central figure of the group was the commander of the Army of Northern Virginia, who had requested his corps and division commanders to meet him there. Though some demonstrations had been made in the direction of the upper fords, General Lee expressed the opinion that the Federal army would cross the river at Germanna or Ely's. Thirty-six hours later General Meade's army, General Grant, now commander-in-chief, being with it, commenced its march to the crossings indicated by General Lee.

The Army of the Potomac, which had now commenced its march towards Richmond, was more powerful in numbers than at any previous period of the war. It consisted of three corps: the Second (Hancock's), the Fifth (Warren's), and the Sixth (Sedgwick's); but the Ninth (Burnside's) acted with Meade throughout the campaign. It was thoroughly equipped, and provided with every appliance of modern warfare. On the other hand, the Army of Northern Virginia had gained little in numbers during the winter just passed and had never been so scantily supplied with food and clothing. The equipment as to arms was well enough for men who knew how to use them, but commissary and quartermaster's supplies were lamentably deficient. A new pair of shoes or an overcoat was a luxury, and full rations would have astonished the stomachs of Lee's ragged Confederates. But they took their privations cheerfully,

and complaints were seldom heard. I recall an instance of one hardy fellow whose trousers were literally "worn to a frazzle," and would no longer adhere to his legs even by dint of the most persistent patching. Unable to buy, beg, or borrow another pair, he wore instead a pair of thin cotton drawers. By nursing these carefully he managed to get through the winter. Before the campaign opened in the spring, the quartermaster received a small lot of clothing, and he was the first man of his regiment to be supplied.

I have often heard expressions of surprise that these ragged, barefooted, half-starved men would fight at all. But the very fact that they remained with their colors through such privations and hardships was sufficient to prove that they would be dangerous foes to encounter upon the line of battle. The morale of the army at this time was excellent, and it moved forward confidently to the grim death-grapple in the wilderness of Spotsylvania with its old enemy, the Army of the Potomac.

General Lee's headquarters were at Orange Court House; of his three corps, Longstreet's was at Gordonsville, Ewell's was on the Rapidan, above Mine Run, and Hill's on his

left, higher up the stream. When the Federal army was known to be in motion, General Lee prepared to move upon its flank with his whole force, as soon as it should clear the river and begin its march southward. The route selected

across the turnpike, and communicated his position to General Lee, who was on the Plank road with Hill's column. He was instructed to regulate his movements by the head of Hill's column, whose progress he could tell by

(BY EDWIN FORBES, AFTER HIS SKETCH MADE AT THE TIME.)

by General Grant led entirely around the right of Lee's position on the river above. His passage of the Rapidan was unopposed, and he struck boldly out on the direct road to Richmond. Two roads lead from Orange Court House down the Rapidan towards Fredericksburg. They follow the general direction of the river, and are almost parallel to each other, the "Old turnpike" nearest the river, and the "Plank road" a short distance south of it. The route of the Federal army lay directly across these two roads, along the western borders of the famous Wilderness.

About noon on the 4th of May Ewell's corps was put in motion on the Orange turnpike, while A. P. Hill, with two divisions, moved parallel with him on the Orange Plank road. The two divisions of Longstreet's corps, encamped near Gordonsville, were ordered to move rapidly across the country and follow Hill on the Plank road. Ewell's corps was the first to find itself in the presence of the enemy. As it advanced along the turnpike on the morning of the 5th, the Federal column was seen crossing it from the direction of Germanna Ford. Ewell promptly formed line of battle

the firing in its front, and not to bring on a general engagement until Longstreet should come up. The position of Ewell's troops, so near the flank of the Federal line of march, was anything but favorable to a preservation of the peace, and a collision soon occurred which opened the campaign in earnest.

BATTLES IN THE WILDERNESS.

GENERAL WARREN, whose corps was passing when Ewell came up, halted, and turning to the right made a vigorous attack upon Edward Johnson's division, posted across the turnpike. J. M. Jones's brigade, which held the road, was driven back in confusion. Stuart's brigade was pushed forward to take its place. Rodes's division was thrown in on Johnson's right, south of the road, and the line, thus reestablished, moved forward, reversed the tide of battle, and rolled back the Federal attack. The fighting was severe and bloody while it lasted. The lines were in such proximity at one point in the woods that when the Federal troops gave way, the 146th New York regiment threw down its arms and surrendered in a body.

Ewell's entire corps was now up,—Johnson's division holding the turnpike, Rodes's division on the right of it, and Early's in reserve. So far Ewell had only been engaged with Warren's corps, but Sedgwick's soon came up from the river and joined Warren on his right. Early's division was sent to meet it. The battle extended in that direction, with steady and determined attacks upon Early's front, until

cution of his plan to swing past the Confederate army and place himself between it and Richmond, offered the expected opportunity of striking a blow upon his flank while his troops were stretched out on the line of march. The wish for such an opportunity was doubtless in a measure "father to the thought" expressed by General Lee three days before, at the signal station on Clark's Mountain.

(BY A. R. WAUD, AFTER HIS SKETCH MADE AT THE TIME.)

nightfall. The Confederates still clung to their hold on the Federal flank against every effort to dislodge them.

When Warren's corps encountered the head of Ewell's column on the 5th of May, General Meade is reported to have said: "They have left a division to fool us here, while they concentrate and prepare a position on the North Anna." If the stubborn resistance to Warren's attack did not at once convince him of his mistake, the firing which announced the approach of Hill's corps along the Plank road, very soon afterwards, must have opened his eyes to the bold strategy of the Confederate commander. General Lee had deliberately chosen this as his battle-ground. He knew this tangled wilderness well, and appreciated fully the advantages such a field afforded for concealing his great inferiority of force and for neutralizing the superior strength of his antagonist. General Grant's bold movement across the lower fords into the Wilderness, in the exe-

Soon after Ewell became engaged on the Old turnpike, A. P. Hill's advance struck the Federal outposts on the Plank road at Parker's store, on the outskirts of the Wilderness. These were driven in and followed up to their line of battle, which was so posted as to cover the junction of the Plank road with the Stevensburg and Brock roads, on which the Federal army was moving toward Spotsylvania. The fight began between Getty's division of the Sixth Corps and Heth's division, which was leading A. P. Hill's column. Hancock's corps, which was already on the march for Spotsylvania by way of Chancellorsville, was at once recalled, and at 4 o'clock in the afternoon was ordered to drive Hill "out of the Wilderness." Wilcox's division was thrown in to Heth's support, and Poague's battalion of artillery took position in a little clearing on the north side of the Plank road, in rear of the Confederate infantry. But there was little use for artillery on such a field. After the battle was

LOOKING FROM THE LACY HOUSE, HEADQUARTERS OF GRANT, MEADE, AND WARREN, TOWARD FAIRFAX'S SKIRMISH. BY EDWIN FORBES, AFTER HIS SKETCH MADE AT THE TIME.

fully joined in the thickets in front, its fire might do as much damage to friend as to foe; so it was silent. It was a desperate struggle between the infantry of the two armies, on a field whose physical aspects were as grim and forbidding as the struggle itself. It was a battle of brigades and regiments rather than of corps and divisions. Officers could not see the whole length of their commands, and could only tell whether the troops on their right and

left were driving or being driven by the sound of the firing. It was a fight at close quarters too, for as night came on, in those tangled thickets of stunted pine, sweet-gum, scrub-oak, and cedar the approach of the opposing lines could only be discerned by the noise of their passage through the underbrush or the flashing of their guns. The usually silent Wilderness had suddenly become alive. The angry flashing of the musketry and its heavy roar, mingled

PART OF THE AFTERNOON OF MAY 31st, IN THE FOREGROUND, OF A PART OF THE BURNING UNION BREASTWORKS ON THE MUCK ROAD. BY A. R. WARD, AFTER HIS SKETCH MADE AT THE TIME.

(BY EDWIN FORBES, FROM HIS SKETCH MADE AT THE TIME.)

with the yells of the combatants as they swayed to and fro in the gloomy thickets, realized to the full the poetic battle-picture of "Beal an Duine"—

"As all the fiends from heaven that fell
Had raised the banner cry of hell."

Death was busy, and he reaped more laurels than either Lee or Grant. General Alexander Hays, of Hancock's corps, was among the killed.

When the battle closed at 8 o'clock, General Lee sent an order to Longstreet to make a night march, so as to arrive upon the field at daylight the next morning. The latter moved at 1 A. M. of the 6th, but it was daylight when he reached the Plank road at Parker's store, three miles in rear of Hill's battle-field. During the night the movements of troops and preparations for battle could be heard on the Federal line, in front of Heth's and Wilcox's divisions, who had so far sustained themselves against every attack by six divisions under General Hancock. But they were thoroughly worn out. Their lines were ragged and irregular, with wide intervals, and in some places fronting in different directions. Expecting to be relieved during the night, no effort was made to re-arrange and strengthen them to meet the storm that was brewing.

As soon as it was light enough to see what little could be seen in that dark forest, Han-

cock's troops swept forward to the attack. The blow fell with greatest force upon Wilcox's troops south of the Orange Plank road. They made what front they could and renewed the fight, until the attacking column overlapping the right wing, it gave way, and the whole line "rolled up" from the right and retired in disorder along the Plank road as far as the position of Poague's artillery, which now opened upon the attacking force. The Federals pressed their advantage and were soon abreast of the

BRIGADIER-GENERAL MICAH JENKINS, C. S. A., KILLED MAY 6TH, 1864. (FROM A TINTYPE.)

artillery on the opposite side, their bullets flying across the road among the guns where General Lee himself stood. For a while matters looked very serious for the Confederates. General Lee, after sending a messenger to hasten the march of Longstreet's troops and another to prepare the trains for a movement to the rear, was assisting in rallying the disordered troops and directing the fire of the artillery, when the head of Longstreet's corps appeared in double column, swinging down the Orange Plank road at a trot. In perfect order, ranks well closed, and no stragglers, those splendid troops came on, regardless of the confusion on every side, pushing their steady way onward like "a river in the sea" of confused and troubled human waves around them. Kershaw's division took the right of the road, and, coming into line under a heavy fire, moved obliquely to the right (south) to meet the Federal left, which had "swung round" in that direction. The Federals were checked in their sweeping advance and thrown back upon their front line of breastworks, where they made a stubborn stand. But Kershaw, urged on by Longstreet, charged with his whole command, swept his front, and captured the works.

Nearly at the same moment, Field's division took the left of the road, with Gregg's brigade in front, Benning's behind it, Law's next, and Jenkins's following. As the Texans in the front line swept past the batteries where General Lee was standing, they gave a rousing cheer for "Marse Robert," who spurred his horse forward and followed them in the charge. When the men became aware that he was "going in" with them, they called loudly to him to go back. "We won't go on unless you go back" was the general cry. One of the men dropped to the rear, and taking the bridle turned his horse around, while General Gregg came up and urged him to do as the men wished. At that moment a member of his staff (Colonel Venable) directed his attention to General Longstreet, whom he had been looking for, and who was sitting on his horse near the Orange Plank road. With evident disappointment, he turned off and joined General Longstreet.

The ground over which Field's troops were advancing was open for a short distance, and fringed on its farther edge with scattered pines beyond which the dense Wilderness growth began. The Federal troops had entered the

BRIGADIER-GENERAL JAMES S. WADSWORTH, MORTALLY WOUNDED MAY 6TH, 1864. DIED MAY 8TH. (FROM A PHOTOGRAPH BY BRADY.)

pinetrees and were advancing with apparently resistless force, when Gregg's eight hundred Texans, regardless of numbers, flanks, or supports, dashed directly upon them. There was a terrific crash mingled with wild yells, which settled down into a steady roar of musketry. In less than ten minutes one-half of that devoted eight hundred were lying upon the field dead or wounded; but they had delivered a staggering blow and broken the force of the Federal advance. Benning's and Law's brigades came promptly to their support, and the whole swept forward together. The tide was flowing the other way now. It ebbed and flowed many times that day, strewing the Wilderness with human wrecks. Law's brigade captured a line of log breastworks in its front, but had held them only a few moments when their former owners came back to claim them. They were rudely received and driven back to a second line several hundred yards beyond, which was also taken. This advanced position was attacked in front and on the right from across the Orange Plank road, and Law's Alabamians "advanced backwards" without standing on the order of their going, until they reached the first line of logs, now in their rear. As their friends in blue still insisted on claiming their property and were ad-

THE BURNING WOODS, MAY 6TH—RESCUING THE WOUNDED. (BY A. R. WAUD, AFTER HIS SKETCH MADE AT THE TIME.)

vancing to take it, they were met by a counter charge and again driven beyond the second line. This was held against a determined attack in which the Federal General Wadsworth was shot from his horse as he rode up close to the right of the line on the Plank road. The position again becoming untenable by reason of the movements of Federal troops on their right, they retired a second time to the works they had first captured. And so, for more than two hours, the storm of battle swept to and fro, in some places passing several times over the same ground, and settling down at length almost where it had begun the day before.

About 10 o'clock it was ascertained that the Federal left flank rested only a short distance south of the Orange Plank road, which offered a favorable opportunity for a turning movement in that quarter. General Longstreet at once moved Mahone's, Wofford's, Anderson's, and Davis's brigades, the whole under General Mahone, around this end of the Federal line. Forming at right angles to it, they attacked in flank and rear, while a general advance was made in front. So far the fight had been one of anvil and hammer. Ringing blows had been given and received, and both sides were bruised and bleeding from their effects. But this first display of the tactics of battle at once changed the face of the field. The Federal left wing

was rolled up in confusion towards the Plank road and then back upon the Brock road, which was its chief outlet towards Spotsylvania.

This partial victory had been a comparatively easy one. The signs of demoralization and even panic among the troops of Hancock's left wing, who had been hurled back by Mahone's flank attack, were too plain to be mistaken by the Confederates, who believed that Chancellorsville was about to be repeated. General Longstreet rode forward and prepared to press his advantage. Jenkins's fresh brigade was moved forward on the Plank road to renew the attack, supported by Kershaw's division while the flanking column should come into position on its right. The latter were now in line south of the road and almost parallel to it. Longstreet and Kershaw rode with General Jenkins at the head of his brigade as it pressed forward, when suddenly the quiet which had reigned for some moments was broken by a few scattering shots on the north of the road, which were answered by a volley from Mahone's line on the south side. The firing in their front, and the appearance of troops on the road whom they failed to recognize as friends through the intervening timber, had drawn a single volley, which lost to them all the fruits of the splendid work they had just done. General Jenkins was killed and Longstreet seri-

ously wounded by our own men. The troops who were following them faced quickly towards the firing and were about to return it; but when General Kershaw called out, "They are friends!" every musket was lowered, and the men dropped upon the ground to avoid the fire.

The head of the attack had fallen, and for a time the movements of the Confederates were paralyzed. The hand of fate seemed to be in it. The same thing had happened to Stonewall Jackson, in this same Wilderness, just one year before. General Lee came forward and directed in person the disposition of the troops for a renewal of the attack, but the change of commanders rendered necessary by the fall of Longstreet, and the resumption of the thread of operations that had fallen from his hands, occasioned a delay of several hours, and then the tide which "taken at the flood leads on to fortune" had ebbed, and the Confederates only received hard knocks instead of a brilliant victory. When at 4 o'clock an attack was made upon the Federal line along the Brock road, it was found strongly fortified and stubbornly defended. The log breastworks had taken fire during the battle, and at one point separated the combatants by a wall of fire and smoke which neither could pass. Part of Field's division captured the works in their front, but were forced to relinquish them for want of support. Meanwhile Burnside's corps, which had reinforced Hancock during the day, made

a vigorous attack on the north of the Orange Plank road. Law's (Alabama) and Perry's (Florida) brigades were being forced back, when, Heth's division coming to their assistance, they assumed the offensive, driving Burnside's troops beyond the extensive line of breastworks constructed previous to their advance.

The battles fought by Ewell on the Old turnpike and by A. P. Hill on the Plank road, on the 5th of May, were entirely distinct, no connected line existing between them. Connection was established with Ewell's right by Wilcox's division, after it had been relieved by Longstreet's troops on the morning of the 6th. While the battle was in progress on the Orange Plank road, on the 6th, an unsuccessful attempt was made to turn Ewell's left next the river, and heavy assaults were made upon the line of Early's division. So persistent were these attacks on the front of Pegram's brigade, that other troops were brought up in rear to its support, but when the offer was made to relieve it, the men rejected the offer and said they needed no assistance.

Late in the day General Ewell ordered a movement against the Federal right wing, similar to that by which Longstreet had "doubled up" Hancock's left in the morning. Two brigades, under General John B. Gordon, moved out of their works at sunset, and lapping the right of Sedgwick's corps made a sudden and determined attack upon it. Taken by sur-

PRESENTATION OF HANCOCK'S CORPS ON THE BROCK ROAD—MORNING OF MAY 7TH.
(BY EDWIN FORD, AFTER HIS SKETCH MADE AT THE TIME.)

OUT OF THE WILDERNESS, SUNDAY MORNING, MAY 8TH—THE MARCH TO SPOTSYLVANIA.
(BY EDWIN FORBES, AFTER HIS SKETCH MADE AT THE TIME.)

prise, the Federals were driven from a large portion of their works with the loss of six hundred prisoners,—among them Generals Seymour and Shaler. Night closed the contest, and with it the battle of the Wilderness.

WHEN Lee's army had appeared on the flank of the Federal line of march on the 5th of May, General Grant at once had faced it and endeavored to push it out of the way. His strongest efforts had been directed to forcing back the Confederate advance on the Orange Plank road, which, if successful, would have enabled him to complete his plan of "swinging past" that army and placing himself between it and Richmond. On the other hand, Lee's principal effort had been to strike the head of Grant's column a crushing blow where it crossed the Plank road, which would force it from its route and throw it in confusion back into the Wilderness. Both had failed. What advantages had been gained by the two days' fighting remained with the Confederates. They held a position nearer the Federal line of march than when the battle began, and had inflicted losses incomparably heavier than they had themselves sustained. Both sides were now strongly intrenched, and neither could well afford to attack. And so the 7th of May was spent in skirmishing, each waiting to see what the other would do. That night the race for Spotsyl-

vania began. General Lee had been informed by "Jeb" Stuart of the movement of the Federal trains southward during the afternoon. After dark the noise of moving columns along the Brock road could be heard, and it was at once responded to by a similar movement on the part of Lee. The armies moved in parallel columns separated only by a short interval. Longstreet's corps (now commanded by R. H. Anderson) marched all night and arrived at Spotsylvania at 8 o'clock on the morning of the 8th, where the ball was already in motion. Stuart had thrown his cavalry across the Brock road to check the Federal advance, and as the Federal cavalry had failed to dislodge him, Warren's corps had been pushed forward to clear the way. Kershaw's, Humphreys', and Law's brigades were at once sent to Stuart's assistance. The head of Warren's column was forced back and immediately commenced intrenching. Spotsylvania Court House was found occupied by Federal cavalry and artillery, which retired without a fight. The Confederates had won the race.

BATTLES OF SPOTSYLVANIA COURT HOUSE.

THE troops on both sides were now rapidly arriving. Sedgwick's corps joined Warren's, and in the afternoon was thrown heavily against Anderson's right wing, which, assisted by the timely arrival of Ewell's corps, repulsed

the attack with great slaughter. Hill's corps (now under General Early) did not arrive until the next morning, May 9th. General Lee's line now covered Spotsylvania Court House, with its left (Longstreet's corps) resting on the Po River, a small stream which flows on the south-west — Ewell's corps in the center, north of the Court House, and Hill's on the right, crossing the Fredericksburg road. These positions were generally maintained during the battles that followed, though brigades and divisions were often detached from their proper commands and sent to other parts of the field to meet pressing emergencies.

No engagement of importance took place on the 9th, which was spent in intrenching the lines and preparing places of refuge from the impending storm. But the 10th was "a real day." Early in the morning it was found that Hancock's corps had crossed the Po above the point where the Confederate left rested, had reached the Shady Grove road, and was threatening our rear, as well as the trains which were in that direction on the Old Court House road leading to Louisa Court House. General Early was ordered from the right with Mahone's and Heth's divisions, and, moving rapidly to the threatened quarter, attacked Hancock's rear division as it was about to recross the Po — driving it with severe loss, through the burning woods in its rear, back across the river.

Meanwhile General Grant was not idle elsewhere. He had commenced his efforts to break through the lines confronting him. The first assault was made upon Field's division of Longstreet's corps and met with a complete and bloody repulse. Again at 3 o'clock in the afternoon, the blue columns pressed forward to the attack, and were sent back torn and bleeding, leaving the ground covered with their dead and wounded. Anticipating a renewal of the assaults, many of our men went out in front of their breastworks, and, gathering up the muskets and cartridge-boxes of the dead and wounded, brought them in and distributed them along the line. If they did not have repeating-rifles, they had a very good substitute — several loaded ones to each man. They had no reserves, and knew that if they could not sufficiently reduce the number of their assailants

to equalize matters somewhat before they reached the works, they might become untenable against such heavy and determined attacks.

A lull of several hours succeeded the failure of the second attack, but it was only a breathing spell preparatory to the culminating effort of the day. Near sunset our skirmishers were driven in and the heavy, dark lines of attack came into view one after another, first in quick time, then in a trot, and then with a rush towards the works. The front lines dissolved before the pitiless storm that met them, but those in rear pressed forward, and over their dead and dying comrades reached that portion of the works held by the Texas brigade. These gallant fellows, now reduced to a mere handful by their losses in the Wilderness, stood manfully to their work. Their line was bent backward by the pressure, but they continued the fight in rear of the works with bayonets and clubbed muskets. Fortunately for them, Anderson's brigade had cleared its own front, and a portion of it turned upon the flank of their assailants, who were driven out, leaving many dead and wounded inside the works.

While this attack was in progress on Field's line, another, quite as determined, was made farther to the right, in front of Rodes's division of Ewell's corps. Doles's brigade was broken and swept out of its works with the loss of three hundred prisoners. But as the attacking force poured through the gap thus made, Daniel's brigade on one side and Steuart's on the other drew back from their lines and fell upon its flanks, while Battle's and Johnston's brigades were hurried up from the left and thrown across its front. Assailed on three sides at once, the Federals were forced back to

the works, and over them, whereupon they broke in disorderly retreat to their own lines.

The next day was rainy and disagreeable, and no serious fighting took place. There were movements, however, along the Federal lines during the day which indicated a withdrawal from the front of Longstreet's corps. Late in the afternoon, under the impression that General Grant had actually begun another flanking movement, General Lee ordered that all the artillery on the left and center, which was "difficult of access," should be withdrawn from the lines, and that everything should be in readiness to move during the night if necessary.

Under this order,

General Long, Ewell's chief of artillery, removed all but two batteries from the line of General Edward Johnson's division, for the reason given, that they were "difficult of access." Johnson's division held an elevated point somewhat advanced from the general line, and known as "the salient" [or "Bloody Angle"; see map], the breastworks there making a considerable angle, with its point towards the enemy. This point had been held because it was a good position for artillery, and if occupied by the enemy would command portions of our line. Such projections on a defensive line are always dangerous if held by infantry alone, as an attack upon the point of the angle can only be met by a diverg-

ing fire; or if attacked on either face, the troops holding the other face, unless protected by works in rear (as were some of the Confederates), are more exposed than those on the side attacked. But with sufficient artillery, so posted as to sweep the sides of the angle, such a position may be very strong. To provide against contingencies, a second line had been laid off and partly

constructed a short distance in rear, so as to cut off this salient.

After the artillery had been withdrawn on the night of the 11th, General Johnson discovered that the enemy was concentrating in his front, and, convinced that he would be attacked in the morning, requested the immediate return of the artillery that had been taken away. The men in the trenches were kept on the alert all night and were ready for the attack, when at dawn on the morning of the 12th a dense column emerged from the pines half a mile in front of the salient and rushed to the attack. They came on, to use General Johnson's words, "in great disorder, with a narrow front, but extending back as far as I could see." Page's battalion of artillery, which had only been ordered back to the trenches at 4 o'clock in the morning, were just arriving and were not in position to fire upon the attacking column, which offered so fair a mark for

THE UNION POSITION AT SPOTSYLVANIA, MORNING OF MAY 10TH, AS SEEN FROM THE REAR OF HANCOCK'S LINES.
(BY EDWIN FORBES, FROM HIS SKETCH MADE AT THE TIME.)

artillery. The guns came only in time to be captured. The infantry in the salient fought as long as fighting was of any use; but deprived of the assistance of the artillery, which constituted the chief strength of the position, they could do little to check the onward rush of the Federal column, which soon overran the salient, capturing General Johnson himself, 20 pieces of artillery, and 2800 men — almost his entire division. The whole thing happened so quickly that the extent of the disaster could not be realized at once. Hancock's troops, who made the assault, had recovered their formation, and, extending their lines across the works on both sides of the salient, had resumed their advance when Lane's brigade of Hill's corps, which was immediately on the right of the captured works, rapidly drew back to the unfinished line in rear, and poured a galling fire upon their left wing, which checked its advance and threw it back with severe loss. General Gordon, whose division (Early's) was in reserve and under orders to support any part of the line about the salient, hastened to throw it in front of the advancing Federal column. As the division was about to charge, General Lee rode up and joined General Gordon, evidently intending to go forward with him. Gordon remonstrated, and the men, seeing his intention, cried out, "General Lee to the rear!"

which was taken up all along the line. One of the men respectfully but firmly took hold of the bridle and led his horse to the rear, and the charge went on. The two moving lines met in rear of the captured works, and after a fierce struggle in the woods the Federals were forced back to the base of the salient. But Gordon's division did not cover their whole front. On the left of the salient, where Rodes's division had connected with Johnson's, the attack was still pressed with great determination. General Rodes drew out Ramseur's brigade from the left of his line (a portion of Kershaw's division taking its place), and sent it to relieve the pressure on his right and restore the line between himself and Gordon. Ramseur swept the trenches the whole length

UNION HOSPITAL AT ALSOP'S FARM-HOUSE, NEAR THE BROCK ROAD, TO WHICH GENERAL SEDGWICK'S BODY WAS BROUGHT, MAY 9TH. (FROM A WAR-TIME PHOTOGRAPH.)

of his brigade, but did not fill the gap, and his right was exposed to a terrible fire from the works still held by the enemy. Three brigades from Hill's corps were ordered up. Perrin's, which was the first to arrive, rushed forward through a fearful fire and recovered a part of the line on Gordon's left. General Perrin fell dead from his horse just as he reached the works. General Daniel had been killed, and Ramseur, though painfully wounded, remained

covered by the salient and the adjacent works. Every attempt to advance on either side was met and repelled from the other. The hostile battle-flags waved over different portions of the same works while the men fought like fiends for their possession. It was "war to the knife and the knife to the hilt." The very mouth of hell seemed to have opened, and death was rioting in its sulphurous fumes.

During the day diversions were made on both

MCCOOL'S FARM-HOUSE, WITHIN THE "BLOODY ANGLE." (FROM A WAR-TIME PHOTOGRAPH.)

in the trenches with his men. Rodes's right being still hard pressed, Harris's (Mississippi) and McGowan's (South Carolina) brigades were ordered forward and rushed through the blinding storm into the works on Ramseur's right. The Federals still held the greater part of the salient, and though the Confederates were unable to drive them out, they could get no farther. Hancock's corps, which had made the attack, had been reinforced by Upton's division of the Sixth Corps and one-half of Warren's corps, as the battle progressed. Artillery had been brought up on both sides, the Confederates using every piece that could be made available upon the salient. Before 10 o'clock General Lee had put in every man that could be spared for the restoration of his broken center. It then became a matter of endurance with the men themselves. All day long and until far into the night the battle raged with unceasing fury, in the space

sides, to relieve the pressure in the center. An attack upon Anderson's (Longstreet's) corps by Wright's Sixth Corps (Sedgwick having been killed on the 9th) was severely repulsed, while, on the other side of the salient, General Early, who was moving with a part of Hill's corps to strike the flank of the Federal force engaged there, met and defeated Burnside's corps, which was advancing at the same time to attack his own (Early's) works.

WHILE the battle was raging at the salient, a portion of Gordon's division was busily engaged in constructing a new and shorter line of intrenchments in rear of the old one, to which Ewell's corps retired before daylight on the 13th. The five days of comparative rest that followed the terrible battle of the 12th were never more welcome than to our wearied men, who had been marching and fighting almost without intermission since the 4th of

May. Their comfort was materially enhanced, too, by the supply of coffee, sugar, and other luxuries to which they had long been strangers, obtained from the haversacks of the enemy who had been killed in their front, or in the Federal lines when they were abandoned. It was astonishing into what close places a hungry Confederate would go to get something to eat. Men would sometimes go out under a severe fire, in the hope of finding a full haversack. It may seem a small matter to the readers of war history; but to the *makers* of it who were in the trenches, or on the march, or engaged in battle night and day for weeks without intermission, the supply of the one article of coffee, furnished by the Army of the Potomac to the Army of Northern Virginia, *was not* a small matter, but did as much as any other material agency to sustain the spirits and bodily energies of the men, in a campaign which taxed both to their utmost limit. Old haversacks gave place to better ones, and tin cups now dangled from the accouter-

ments of the Confederates, who at every rest on the march or interval of quiet on the lines could be seen gathered around small fires, preparing the coveted beverage.

In the interval from the 12th to the 18th, our army was gradually moving east to meet corresponding movements on the other side. Longstreet's corps was shifted from the left to the extreme right, beyond the Fredericksburg road. Ewell's corps still held the works in rear of the famous salient, when on the morning of the 18th a last effort was made to force the lines of Spotsylvania at the only point where previous efforts had met with even partial success. This was destined to a more signal failure than any of the others. Under the fire of thirty pieces of artillery, which swept all the approaches to Ewell's line, the attacking force was broken and driven back in disorder before it came well within reach of the muskets of the infantry. After the failure of this attack, the "sidling" movement, as the men expressed it, again began, and on the

UNION ENGINEERS ARE PREPARING THE ROAD ASCENDING FROM THE PONTOON BRIDGE AT JERICHO MILLS.
(FROM A WAR-TIME PHOTOGRAPH.)

afternoon of the 19th Ewell's corps was thrown round the Federal left wing to ascertain the extent of this movement. After a severe engagement, which lasted until night, Ewell withdrew, having lost about nine hundred men in the action. This seemed a heavy price to pay for information that might have been otherwise obtained, but the enemy had suffered more severely, and General Grant was delayed in his

turning movement for twenty-four hours. He, however, got the start in the race for the North Anna: Hancock's corps, leading off on the night of the 20th, was followed rapidly by the remainder of his army.

THE RACE FOR THE NORTH ANNA.

ON the morning of the 21st Ewell's corps moved from the left to the right of our line, and later on the same day it was pushed southward on the Telegraph road, closely followed by Longstreet's corps.* A. P. Hill brought up the rear that night, after a sharp "brush" with the Sixth Corps, which was in the act of retiring from its lines. Lee had the inside track this time, as the Telegraph road on which he moved was the direct route, while Grant had to swing round on the arc of a circle of which this was the chord. About noon on the 22d the head of our column reached the North Anna, and that night Lee's army lay on the south side of the river. We had won the second heat and secured a good night's rest besides, when the Federal army appeared on the other side in the forenoon of the 23d.

* Swinton and others state that Longstreet moved on the night of the 20th, followed by Ewell. This is an error.—E. M. L.

GENERAL GRANT AND STAFF AT BETHESDA CHURCH. (SEE MAP, PAGE 296) GENERAL GRANT IS SITTING WITH HIS BACK TO THE SMALLER TREE. (FROM A WAR-TIME PHOTOGRAPH.)

Warren's corps crossed the river that afternoon without opposition at Jericho Ford, four miles above the Chesterfield bridge on the Telegraph road; but as it moved out from the river it was met by Wilcox's division of Hill's corps, and a severe but indecisive engagement ensued, the lines confronting each other intrenching as usual. Meanwhile a small earthwork, that had been built the year before, covering the approaches to the bridge on the Telegraph road and now held by a small detachment from Kershaw's division, was attacked and carried by troops of Hancock's corps, the Confederates retiring across the river with the loss of a few prisoners.

It did not seem to be General Lee's purpose to offer any serious resistance to Grant's passage of the river at the points selected. His lines had been retired from it at both these points, but touched it at Ox Ford, a point intermediate between them. Hancock's corps, having secured the Chesterfield bridge, crossed over on the morning of the 24th, and, extending down the river, moved out until it came upon Longstreet's and Ewell's corps in position and ready for battle. The Sixth Corps (General Wright) crossed at Jericho Ford and joined Warren. The two wings of Grant's army were safely across the river, but there was no connection between them.

Lee had only thrown back his flanks and let them in on either side, while he held the river between; and when General Grant attempted to throw his center, under Burnside, across between the ford and the bridge, it was very severely handled and failed to get a foothold on the south side. A detach-

Turning quickly, I caught a glimpse of something blue disappearing behind a pile of earth that had been thrown out from the railroad cut some distance in front. Taking one of the muskets leaning against the works, I waited for the reappearance of my friend in blue, who had taken such an unfair advantage

THE PENNSYLVANIA RESERVE RESISTING A CONFEDERATE ATTACK NEAR BETHESDA CHURCH, JUNE 2D.
(BY EDWIN FORBES, AFTER HIS SKETCH MADE AT THE TIME.)

ment from Warren's corps was sent down on the south side to help Burnside across, but it was attacked by Mahone's division, and driven back with heavy loss, narrowly escaping capture. General Grant found himself in what may be called a military dilemma. He had cut his army in two by running it upon the point of a wedge. He could not break the point, which rested upon the river, and the attempt to force it out of place by striking on its sides must of necessity be made without much concert of action between the two wings of his army, neither of which could reënforce the other without crossing the river twice; while his opponent could readily transfer his troops as needed, from one wing to the other, across the narrow space between them.

The next two days were consumed by General Grant in fruitless attempts to find a vulnerable point in our lines. The skirmishers were very active, often forcing their way close up to our works. The line of my brigade crossed the Richmond and Fredericksburg railroad. It was an exposed point, and the men stationed there, after building their log breastwork, leant their muskets against it and moved out on one side, to avoid the constant fire that was directed upon it. As I was passing that point on one occasion, the men called to me, "Stoop!" At the same moment I received a more forcible admonition from the whiz of a minie-ball, close to my head.

of me. He soon appeared, rising cautiously behind his earthwork, and we both fired at the same moment, neither shot taking effect. This time my friend didn't "hedge," but commenced reloading rapidly, thinking, I suppose, that I would have to do the same. But he was mistaken; for, taking up another musket, I fired at once, with a result equally surprising to both of us, he probably at my being able to load so quickly, and I at hitting the mark. He was found there wounded, shortly afterward, when my skirmishers were pushed forward. It was my first and only duel, and justifiable, I think, under the circumstances.

On the morning of May 27th General Grant's army had disappeared from our front. During the night it had "folded its tents like the Arab and as quietly stolen away," on its fourth turning movement since the opening of the campaign. The Army of the Potomac was already on its march for the Pamunkey River at Hanover town, where the leading corps crossed on the morning of the 27th. Lee moved at once to head off his adversary, whose advance column was now eight miles nearer Richmond than he was. In the afternoon of the 28th, after one of the severest cavalry engagements of the war, in which Hampton and Fitz Lee opposed the advance of Sheridan at Hawes's Shop, the infantry of both armies came up and again confronted each other along the Totopotomoy, a small creek flowing into the

Pamunkey from the south. Here the Confederate position was found too strong to be attacked in front with any prospect of success, and again the "sidling" movements began — this time towards Cold Harbor.

BATTLE OF COLD HARBOR.

SHERIDAN'S cavalry had taken possession of Cold Harbor on the 31st, and it had been promptly followed up by two corps of infantry, Longstreet's and a part of Hill's corps, with

accomplished with small loss, and had the effect of holding these two corps in his front and preventing their coöperation in the attack at Cold Harbor, which had been ordered for the next day.

Early in the morning of the 2d, I was ordered to move with my own and Anderson's brigades, of Field's division, "to reënforce the line on the right," exercising my own discretion as to the point where assistance was most needed. After putting the troops in motion, I rode along the line, making a personal inspection

VIEW OF UNION BREASTWORKS ON THE COLD HARBOR LINE, JUNE 1ST.
(BY EDWIN FORBES, AFTER HIS SKETCH MADE AT THE TIME.)

Hoke's and Breckinridge's divisions,* were thrown across their front. The fighting began on the Cold Harbor line, late in the afternoon of the 1st of June, by a heavy attack upon the divisions of Hoke and Kershaw. Clingman's brigade on Hoke's left gave way, and Wofford's on Kershaw's right, being turned, was also forced back; but the further progress of the attack was checked and the line partly restored before night. By the morning of the 2d of June, the opposing lines had settled down close to each other, and everything promised a repetition of the scenes at Spotsylvania.

Three corps of Grant's army (General W. F. Smith's divisions Eighteenth Corps having arrived from Drewry's Bluff) now confronted the Confederate right wing at Cold Harbor, while the other two looked after Early's (Ewell's) corps near Bethesda Church. In the afternoon of June 2d, General Early, perceiving a movement which indicated a withdrawal of the Federal force in his front, attacked Burnside's corps while it was in motion, striking also the flank of Warren's corps, and capturing several hundred prisoners. This was

accomplished with small loss, and had the effect of holding these two corps in his front and preventing their coöperation in the attack at Cold Harbor, which had been ordered for the next day. Early in the morning of the 2d, I was ordered to move with my own and Anderson's brigades, of Field's division, "to reënforce the line on the right," exercising my own discretion as to the point where assistance was most needed. After putting the troops in motion, I rode along the line, making a personal inspection

Convinced that under such assaults as we had sustained at Spotsylvania our line would

* Breckinridge came from the Valley and joined Lee's army at the North Anna, with about 2700 men.

Hoke had just arrived from Petersburg. Pickett's division had also joined its corps at the North Anna.

COLD HARBOR, JUNE 30—BOMB-PROOFS ON THE LINE OF THE SECOND CORPS.
(BY EDWIN FORBES, AFTER HIS SKETCH MADE AT THE TIME.)

be broken at that point, I proposed to cut off the angle by building a new line across its base, which would throw the marshy ground in our front and give us a clear sweep across it with our fire from the slope on the other side. This would not only strengthen but shorten the line considerably, and I proposed to General Kershaw to build and occupy it with my two brigades that night.

Meanwhile the enemy was evidently concentrating in the woods in front, and every indication pointed to an early attack. Nothing could be done upon the contemplated line during the day, and we waited anxiously the coming of night. The day passed without an attack. I was as well satisfied that it would come at dawn the next morning as if I had seen General Meade's order directing it. That no mistake should be made in the location of the works, I procured a hatchet, and accompanied by two members of my staff, each with an armful of stakes, went out after dark, located the line, and drove every stake upon it. The troops were formed on it at once, and before morning the works were finished. Artillery was placed at both ends of the new line, abreast of the infantry. General Kershaw then withdrew that portion of his division which occupied the salient, the men having leveled the works as far as possible before leaving them.

Our troops were under arms and waiting, when with the misty light of early morning the scattering fire of our pickets who now occupied the abandoned works in the angle an-

nounced the beginning of the attack. As the assaulting column swept over the old works a loud cheer was given, and it rushed on into the marshy ground in the angle. Its front covered little more than the line of my own brigade of less than a thousand men; but line followed line until the space inclosed by the old salient became a mass of writhing humanity, upon which our artillery and musketry played with cruel effect. I had taken position on the slope in rear of the

line and was carefully noting the firing of the men, which soon became so heavy that I feared they would exhaust the cartridges in their boxes before the attack ceased. Sending an order for a supply of ammunition to be brought into the lines, I went down to the trenches to regulate the firing. On my way to them I met a man, belonging to the 15th Alabama regiment of my brigade, running to the rear through the storm of bullets that swept the hill. He had left his hat behind in his retreat, was crying like a big baby, and was the bloodiest man I ever saw. "Oh, General," he blubbered out, "I am dead! I am killed! Look at this!" showing his wound. He was a broad, fat-faced fellow, and a minie-ball had passed through his cheek and the fleshy part of his neck, letting a large amount of blood. Finding it was only a flesh-wound, I told him to go on; he was not hurt. He looked at me doubtfully for a second as if questioning my veracity or my surgical knowledge, I don't

EXTREME RIGHT OF THE CONFEDERATE LINE, COLD HARBOR.
(FROM A WAR-TIME PHOTOGRAPH.)

know which; then, as if satisfied with my diagnosis, he broke into a broad laugh, and, the tears still running down his cheeks, trotted off, the happiest man I saw that day.

On reaching the trenches, I found the men in fine spirits, laughing and talking as they stood. There, too, I could see more plainly the terrible havoc made in the ranks of the assaulting column. I had seen the dreadful carnage in front of Marye's Hill at Fredericksburg.

skill during the attack on the 3d, reaching not only the front of the attacking force, but its flanks also, as well as those of the supporting troops.

While we were busy with the Eighteenth Corps on the center of the general line, the sounds of battle could be heard both on the right and left, and we knew from long use what that meant. It was a general advance of Grant's whole army. Early's corps below

BRASS CORPSE ON THE UNION LINE, COLD HARBOR. (BY A. R. WAUD, AFTER HIS SKETCH MADE AT THE TIME.)

and on the "old railroad cut" which Jackson's men held at the Second Manassas; but I had seen nothing to exceed this. It was not war; it was murder. When the fight ended, more than a thousand men lay in front of our works either killed or too badly wounded to leave the field.* Among them were some who were not hurt, but remained among the dead and wounded rather than take the chances of going back under that merciless fire. Most of these came in and surrendered during the day, but were fired on in some instances by their own men (who still held a position close in our front) to prevent them from doing so. The loss in my command was fifteen or twenty, most of them wounded about the head and shoulders, myself among the number. Our artillery was handled superbly during the action. Major Hamilton, chief of artillery of Kershaw's division, not only coöperated with energy in strengthening our line on the night of June 2d, but directed the fire of his guns with great

Bethesda Church was attacked without success. On our right, where the line extended towards the Chickahominy, it was broken at one point, but at once restored by Finnygan's (Florida) brigade, with heavy loss to Hancock's troops who were attacking there. The result of the action in the center, which has been described, presents a fair picture of the result along the entire line,—a grand advance, a desperate struggle, a bloody and crushing repulse. Before 8 o'clock A. M. on the 3d of June the battle of Cold Harbor was over, and with it Grant's "overland campaign" against Richmond.

When General Grant was appointed to the command of the Union armies and established his headquarters with the Army of the Potomac, we of the Army of Northern Virginia knew very little about his character and capacity as a commander. Even "old army" officers, who were supposed to know all about any one who had ever been in the army before the war, seemed to know as little as anybody else.

* From the close range of the artillery and musketry, there must have been a much greater proportion of these than usual. I estimated the whole loss of the Eighteenth Corps, which made the attack, at between

4000 and 5000.—E. M. L. [The Official Records show that the losses of that corps at Cold Harbor aggregated 3019.—EDITOR.]

The opinion was pretty freely expressed, however, that his Western laurels would wither in the climate of Virginia. His name was associated with Shiloh, where it was believed that he had been outgeneraled and badly beaten by Albert Sidney Johnston, and saved by Buell. The capture of Vicksburg and the battle of Chattanooga, which gave him a brilliant reputation at the North, were believed by the Confederates to be due more to the weakness of the forces opposed to him and the bad generalship of their commanders than to any great ability on his part. That he was bold and aggressive, we all knew, but we believed that it was the boldness and aggressiveness that arises from the consciousness of strength, as he had generally managed to fight his battles with the advantage of largely superior numbers. That this policy of force would be pursued when he took command in Virginia, we had no doubt; but we were not prepared for the unparalleled stubbornness and tenacity with which he persisted in his attacks under the fearful losses which his army sustained at the Wilderness and at Spotsylvania. General Grant's method of conducting the campaign was frequently discussed among the Confederates, and the universal verdict was that he was no strategist and that he relied almost entirely upon the brute force of numbers for success. Such a policy is not characteristic of a high order of generalship, and seldom wins unless the odds are overwhelmingly on the side of the assailant. It failed in this instance, as shown by the result at Cold Harbor, which necessitated an entire change in the plan of campaign. What a part at least of his own men thought about General Grant's methods was shown by the fact that many of the prisoners taken during the campaign complained bitterly of the "useless butchery" to which they were subjected, some going so far as to prophesy the destruction of their army. "He fights!" was the pithy reply of President Lincoln to a deputation of influential politicians who urged his removal from the command of the army. These two words embody perfectly the Confederate idea of General Grant at that time. If, as the mediæval chroniclers tell us, Charles Martel (the Hammer) gained that title by a seven days' continuous battle with the Saracens at Tours, General Grant certainly entitled himself to a like distinction by his thirty days' campaign from the Wilderness to Cold Harbor.

General Lee held so completely the admiration and confidence of his men that his conduct of a campaign was rarely criticised. Few points present themselves in his campaign from the Wilderness to Cold Harbor upon which criticism can lay hold, when all the circumstances are considered. His plan of striking

the flank of Grant's army as it passed through the Wilderness is above criticism. Fault can be found only with its execution. The two divisions of Longstreet at Gordonsville, and Anderson's division of Hill's corps left on the Upper Rapidan, were too widely separated from the rest of the army, and, as the event proved, should have been in supporting distance of A. P. Hill on the Orange Plank road on the afternoon of the 5th of May. That he did not strike Grant a damaging blow when he had him at such disadvantage on the North Anna may seem strange to those who had witnessed his bold aggressiveness at the Wilderness and on other fields. He was ill and confined to his tent at the time; but, as showing his purpose had he been able to keep the saddle, he was heard to say, as he lay prostrated by sickness, "We must strike them a blow; we must never let them pass us again."* Whatever General Lee did, his men thought it the best that could be done under the circumstances. Their feeling towards him is well illustrated by the remark of a "ragged rebel" who took off his hat to the general as he was passing and received a like courteous salute in return: "God bless Marse Robert! I wish he was emperor of this country and I was his carriage-driver."

The results of the "overland campaign" against Richmond, in 1864, cannot be gauged simply by the fact that Grant's army found itself within a few miles of the Confederate capital when it ended. It might have gotten there in a much shorter time and without any fighting at all. Indeed, one Federal army under General Butler was already there, threatening Richmond, which was considered by the Confederates much more secure after the arrival of the armies of Lee and Grant than it had been before. Nor can these results be measured only by the losses of the opposing armies on the battlefield, except as they affected the morale of the armies themselves; for their losses were about proportional to their relative strength. So far as the Confederates were concerned, it would be idle to deny that they (as well as General Lee himself) were disappointed at the result of their efforts in the Wilderness on the 5th and 6th of May, and that General Grant's constant "hammering" with his largely superior force had to a certain extent a depressing effect upon both officers and men. "It's no use killing these fellows; a half dozen take the place of every one we kill," was a common remark in our army. We knew that our resources of men were exhausted and that the vastly greater resources of the Federal Government, if brought fully to bear, even in this costly kind of warfare, must wear us out

* Statement of Colonel Venable of General Lee's staff.—E. M. L.

in the end. The question with us (and one often asked at the time) was, "How long will the people of the North, and the army itself, stand it?" We heard much about the demoralization of Grant's army and of the mutterings of discontent at home with the conduct of the campaign, and we verily believed that their patience would soon come to an end.

So far as the fighting qualities of our men were concerned, they were little if at all impaired by the terrible strain that had been put upon them. Had General Lee so ordered, they would have attacked the Federal army, after the battle of Cold Harbor, with the same

though perhaps a more quiet courage than they had displayed on entering the campaign thirty days before. The Army of Northern Virginia was so well seasoned and tempered that, like the famous Toledo blade, it could be bent back and doubled upon itself, and then spring again into perfect shape.

It may justly be said of both armies that in this terrible thirty days' struggle their courage and endurance were superb. Both met "foemen worthy of their steel," and battles were fought such as could only have occurred between men of kindred race, and nowhere else than in America.

HANCOCK'S CORPS ASSAULTING THE WORKS AT THE "BLOODY ANGLE."

HAND-TO-HAND FIGHTING AT SPOTSYLVANIA.

BY THE HISTORIAN OF THE SIXTH CORPS.

GENERAL HANCOCK'S surprise and capture of the larger portion of Edward Johnson's division, and the capture of the salient "at Spotsylvania Court House on the 12th of May, 1864, accomplished with the Second Corps," have been regarded as one of the most brilliant feats of that brilliant soldier's career; but without the substantial assistance of General Wright, grand old John Sedgwick's worthy successor, and the Sixth Corps, a defeat as bitter as his victory was sweet would have been recorded against the hero of that day.

VOL. XXXIV.—42.

The storm which had set in early in the afternoon of the 11th of May continued with great severity, and but little rest was obtained during the night. Soon after dark, however, a remarkable change in the weather took place, and it became raw and disagreeable; the men gathered in small groups about half-drowned fires, with their tents stretched around their shoulders, while some had hastily pitched the canvas on the ground, and sought shelter beneath the rumpled and dripping folds. Others rolled themselves up, and lay close to

TODD'S TAVERN IN WAR-TIME. (FROM A PHOTOGRAPH.)

the simmering logs, eager to catch a few moments' sleep; many crouched about, without any shelter whatever, presenting a pitiable sight.

Throughout the day some skirmishing and sharpshooting had occurred, but this had been of a spasmodic character, and had elicited no concern. About dusk the Sixth Corps moved to a position on the right and rear of the army. The stormy night was favorable to Hancock's movement, and about 10 o'clock he put his troops in motion, marching to a point on the left of the Sixth Corps' former position in the neighborhood of the Brown house, massing his troops in that vicinity.

At the beginning of the campaign the Army of the Potomac had been reorganized into three infantry corps—the Second (Hancock), the Fifth (Warren), and the Sixth (Sedgwick, now Wright). The Ninth (Burnside) served as an independent command until May 24th, when it was permanently attached to Meade's army. A cavalry corps under Sheridan completed the organization. General Grant's orders to Hancock were to assault at daylight on the 12th in coöperation with Burnside on his left, while Wright and Warren were held in readiness to assault on his right. The Confederate army was composed of three corps—Longstreet (now R. H. Anderson) on their left, Ewell in the center, and A. P. Hill on the right. The point to be assaulted was a salient of field works on the Confederate center, afterwards called the "Bloody Angle." It was held by General Edward Johnson's division. Here the Confederate line broke off at an angle of ninety degrees, the right parallel, about the length of a small brigade, being occupied by General George H. Steuart's regiments. This point was a part or continuation of the line of works charged and carried by Gen-

eral Upton on May 10th, and was considered to be the key to Lee's position.

Just as the day was breaking, Barlow's and Birney's divisions of Hancock's corps pressed forward upon the unsuspecting foe, and leaping the breastworks after a hand-to-hand conflict with the

bewildered enemy, in which guns were used as clubs, possessed themselves of the intrenchments. Over 3,000 prisoners were taken, including General Johnson and General Steuart. Twenty Confederate cannon became the permanent trophies of the day, 12 of them belonging to Page, and 8 to Cutshaw.

Upon reaching the second line of Lee's works, held by Wilcox's division, who by this time had become apprised of the disaster to their comrades, Hancock met with stern resistance, as Lee in the meantime had been hurrying troops to Ewell from Hill on the right, and Anderson on the left, and these were sprung upon our victorious lines with such an impetus as to drive them hastily back towards the left of the salient.*

GENERAL EMORY UPTON. (FROM A PHOTOGRAPH BY BRADY.)

* General Grant ("Personal Memoirs," p. 231) says: "Burnside on the left had advanced up east of the salient to the very parapet of the enemy. Potter, commanding one of his divisions, got over, but was not able

to remain there. . . . Burnside accomplished but little on our left of a positive nature, but negatively a great deal. He kept Lee from reënforcing his center from that quarter."—EDITOR.

"THE BATTLE AT THE 'MELLODY ANGLE.'" (BY FRANK H. SCHELL, AFTER DRAWINGS BY G. N. GALLOWAY.)

As soon as the news of Hancock's good and ill success reached army headquarters, the Sixth Corps — Upton's brigade being in advance — was ordered to move with all possible haste to his support. At a brisk pace we crossed a line of intrenchments a short distance in our front, and, passing through a strip of timber, at once began to realize our nearness to the foe. It was now about 6 o'clock, and the enemy, reënforced, were making desperate efforts to regain what they had lost. Our forces were hastily retiring at this point before the concentrated attack of the enemy, and these with our wounded lined the road. We pressed forward and soon cleared the woods and reached an insidious fen, covered with dense marsh grass, where we lay down for a few moments awaiting orders. I cannot imagine how any of us survived the sharp fire that swept over us at this point — a fire so keen that it split the blades of grass all about us, the minies moaning in a furious concert as they picked out victims by the score.

The rain was still falling in torrents, and held the country about in obscurity. The command was soon given to my regiment, the 95th Pennsylvania Volunteers, Captain Macfarlain commanding,—it being the advance

of Upton's brigade,—to "rise up," whereupon with hurrahs we went forward, cheered on by Colonel Upton, who had led us safe through the Wilderness. It was not long before we reached an angle of works constructed with great skill. Immediately in our front an abatis had been arranged consisting of limbs and branches interwoven into one another, forming footlocks of the most dangerous character. But there the works were, and over some of us went, many never to return. At this moment Lee's strong line of battle, hastily selected for the work of retrieving ill fortune, appeared through the rain, mist, and smoke. We received their bolts, losing nearly one hundred of our gallant 95th. Colonel Upton saw at once that this point must be held at all hazards; for if Lee should recover the angle, he would be enabled to sweep back our lines right and left, and the fruits of the morning's victory would be lost. The order was at once given us to lie down and commence firing; the left of our regiment rested against the works, while the right slightly refused rested upon an elevation in front. And now began a desperate and pertinacious struggle.

Under cover of the smoke-laden rain the enemy was pushing large bodies of troops for-

GENERAL GRANT RECONNOITERING THE CONFEDERATE POSITION AT SPOTSYLVANIA COURT HOUSE.
(BY C. W. REED, AFTER A SKETCH MADE AT THE TIME.)

Mr. Reed, the artist, belonged to Bigelow's 9th Massachusetts battery, which, with a battery of the 5th Regular Artillery, was holding the Fredericksburg road (see map, page 288) at the place

where General Grant made his observation. At the time, the 9th Massachusetts Volunteers were crossing the road from the left toward the right of the line.—EDITOR.

ward, determined at all hazards to regain the lost ground. Could we hold on until the remainder of our brigade would come to our assistance? Regardless of the heavy volleys of the enemy which were thinning our ranks, we stuck to the position, and returned the fire until the 5th Maine and the 121st New York of our brigade came to our support, while the 90th Pennsylvania went in on our right; thus re-energized, we doubled our exertions. The smoke, which was dense at first, was intensified by each discharge of artillery to such an extent that the accuracy of our aim became very uncertain, but nevertheless we kept up the fire in the supposed direction of the enemy. Meanwhile they were crawling forward under cover of the smoke, until, reaching a certain point, and raising their assault yell, they charged gallantly up to the very mounds of our pieces and reoccupied the Angle.

Upon reaching the breastwork, the Confederates for a few moments had the advantage of us, and made good use of their rifles. Our men went down by the score; all the artillery horses were down; the gallant Upton was the only mounted officer in sight. Hat in hand, he bravely cheered his men, and begged them to "hold this point." All of his staff had been either killed, wounded, or dismounted.

At this moment, and while the open ground in rear of the Confederate works was choked with troops, a section of Battery C, 5th United States Artillery, under Lieutenant Richard Metcalf,* was brought into action and increased the carnage by opening at short

range with double charges of canister. This staggered the apparently exultant enemy. These guns in the maze of the moment were run up by hand close to the famous Angle, fired again and again, and were only abandoned when all the drivers and cannoneers had fallen. The battle was now at white heat.

The rain continued to fall, and clouds of smoke hung over the scene. Like leeches we stuck to the work, determined by our fire to keep the enemy from rising up. Captain John D. Fish of Upton's staff, who had until this time performed valuable service in conveying ammunition to the gunners, fell, pierced by a bullet. This brave officer seemed to court death as he rode back and forth between the caissons and cannoneers with stands of canister under his "gum" coat. "Give it to them, boys! I'll bring you the canister," said he; and as he turned to cheer the gunners, he fell from his horse, mortally wounded. In a few moments the two brass pieces of the 5th Artillery, cut and hacked by the bullets of both antagonists, lay unworked with their muzzles projecting over the enemy's works, and their wheels half sunk in the mud. Between the lines and near at hand lay the horses of these guns, completely riddled. The dead and wounded were torn to pieces by the canister as it swept the ground where they had fallen. The mud was half way to our knees, and by our constant movement the fallen were almost buried at our feet. We now backed off from the breastwork a few yards, abandoning

* This is, I believe, the only instance in the history of the war of a battery charging on breastworks. It was commanded by Lieutenant James Gilliss, and was attached to the Second Corps. Sergeant William E. Lines, one of only two survivors of the section that went in on that day, and who commanded the right gun of that section, has given the writer the following facts relative to the matter. He says:

"After the capture of the Confederate works, we were put in position just under the hill near the small pine-trees so much spoken of. We fired a few rounds of solid shot. Of course we could not see the Confederate line, but we elevated our guns so as to clear our own infantry. While we were waiting, a staff officer with a Sixth Corps badge rode up to Lieutenant Gilliss, and I saw that they had some argument or dispute, for the officer soon went away. Directly another officer rode up to Gilliss, and the same sort of colloquy took place, the officer evidently wanting Gilliss to do something that the latter would not do. This officer rode away. In a very short time General Wright, who was commanding the Sixth Corps, rode up to Gilliss, and had a moment's conversation with him. Lieutenant Metcalf then came over to the first section, and gave the command, 'I order the guns,' 'drivers mount,' 'cannoneers mount,' 'cannoneers rear,' and away we went, up the hill, past our infantry, and into position. The staff officer who led us was shot before we got into position. I have often thought it was owing to that fact that we got so close to the enemy's works. We were a considerable distance in front of our infantry, and of course artillery could not live long under such a fire as the enemy were putting through there. Our

men went down in short order. The left gun fired nine rounds. I fired fourteen with mine, and was assisted in the last four rounds by an officer of a Vermont regiment, and by another from the 95th Pennsylvania, both of whom were shot. The effect of our canister upon the Confederates was terrible: they were evidently trying to strengthen their first line from the second when we opened on them, and you can imagine the execution at that distance. When Lieutenant Metcalf and myself could no longer serve the guns, we withdrew. Our section went into action with 23 men and 1 officer—Lieutenant Metcalf. The only ones who came out sound were the lieutenant and myself. Every horse was killed, 7 of the men were killed outright, 16 wounded; the gun carriages were so cut with bullets as to be of no further service. . . . 27 balls passed through the lid of the limber chest while Number Six was getting out ammunition, and he was wounded in the face and neck by the fragments of wood and lead. The sponge bucket on my gun had 39 holes in it, being perforated like a sieve. The force of the balls can be imagined when I say that the bucket was made of one-eighth inch iron. One curious circumstance on the morning we captured the works [May 12th] was, that musketry shots seemed to make such a slight noise; instead of the sharp *bing* of the shot, it was a dull *thud*. This may have been an important aid to our success, as the [first] firing of the enemy's skirmishers did not alarm their men in the breastworks."—G. N. G.

It is also claimed that a section of Brown's Rhode Island battery was run up to the breastworks in a similar manner.—EDITOR.

for a while the two twelve-pounders, but still keeping up a fusillade. We soon closed up our shattered ranks and the brigade settled down again to its task. Our fire was now directed at the top of the breastworks, and woe be to the head or hand that appeared above it. In the meantime the New Jersey brigade, Colonel W. H. Penrose, went into action on our right, and the Third Brigade, General Eustis's, was hard at work. The Vermont brigade, under Colonel Lewis A. Grant, that had been sent to Barlow's assistance, was now at the Angle, and General Wheaton's brigade was deep in the struggle. The Second and Third Divisions of the Sixth Corps were also ready to take part. It will thus be seen that we had no lack of men for the defense or capture of this position, whichever it may be termed.

The great difficulty was the prescribed limits of the Angle, around which we were fighting, which precluded the possibility of getting more than a limited number into action at once. At one time our ranks were crowded in some parts four deep by reënforcements. Major Henry P. Truefitt, commanding the 119th Pennsylvania, was killed, and Captain Charles P. Warner, who succeeded him, was shot dead. Later in the day Major William Ellis, of the 49th New York, who had excited our admiration, was shot through the arm and body with a ramrod during one of several attempts to get the men to cross the works and drive off the enemy. Our losses were frightful. What remained of many different regiments that had come to our support had concentrated at this point, and had planted their tattered colors upon a slight rise of ground close to the Angle, where they staid during the latter part of the day.

To keep up the supply of ammunition pack mules were brought into use, each animal carrying three thousand rounds. The boxes were dropped close behind the troops engaged, where they were quickly opened by the officers or file-closers, who served the ammunition to the men. The writer fired four hundred rounds of ammunition, and many others as many or more. In this manner a continuous and rapid fire was maintained, to which the enemy replied with vigor for a while.

Finding that we were not to be driven back, the Confederates began to use more discretion, exposing themselves but little, using the loopholes in their works to fire through, and at times placing the muzzles of their rifles on the top logs, seizing the trigger and small of the stock, and

elevating the breech with one hand sufficiently to reach us. During the day one of our batteries took position behind us, sending shell after shell close over our heads, to explode inside the Confederate works. In like manner Coehorn mortars eight hundred yards in our rear sent their shells with admirable precision gracefully curving over us. Sometimes the enemy's fire would slacken, and the moments would become so monotonous that something had to be done to stir them up. Then some resolute fellow would seize a fence rail or piece of abatis, and, creeping close to the breastworks, thrust it over among the enemy, and then drop on the ground to avoid the volley that was sure to follow. A daring lieutenant in one of our left companies leaped upon the breastworks, took a rifle that was handed to him, and discharged it among the foe. In like manner he discharged another, and was in the act of firing a third shot when his cap flew up in the air, and his body pitched headlong among the enemy.

On several occasions squads of disheartened Confederates raised pieces of shelter tents above the works as a flag of truce; upon our slackening fire and calling to them to come in, they would immediately jump the breastworks and surrender. One party of twenty or thirty thus signified their willingness to submit; but owing to the fact that their comrades occasionally took advantage of the cessation to get a volley into us, it was some time before we concluded to give them a chance. With leveled pieces we called to them to come in. Springing upon the breastworks in a body, they stood for an instant panic-stricken at the terrible array before them; that momentary delay was the signal for their destruction. While we, with our fingers pressing the trigger, shouted to them to jump, their troops, massed in the rear, poured a volley into them, killing or wounding all but a few, who dropped with the rest and crawled in under our pieces, while we instantly began firing.

The battle, which during the morning raged with more or less violence on the right and left of this position, gradually slackened, and attention was concentrated upon the Angle. So continuous and heavy was our fire that the head logs of the breastworks were cut and torn until they resembled hickory brooms. Several large oak-trees, which grew just in the rear of the works, were completely gnawed off by our converging fire, and about 3 o'clock in the day fell among the enemy with a loud crash.*

Towards dusk preparations were made to

* The stump of one of these trees is preserved in Washington. In his official report, Brigadier-General Samuel McGowan, who commanded a brigade in Wilcox's Confederate division, says: "To give some idea of the intensity of the fire, an oak-tree twenty-two inches

in diameter, which stood just in rear of the right of the brigade, was cut down by the constant scaling of musket-balls, and fell about 12 o'clock Thursday night, injuring by its fall several soldiers in the 1st South Carolina regiment."—EDITOR.

relieve us. By this time we were nearly exhausted, and had fired three to four hundred rounds of ammunition per man. Our lips were encrusted with powder from "biting cartridges." Our shoulders and hands were coated with mud that had adhered to the butts of our rifles.*

The troops of the Second Corps, who were to relieve us, now moved up, took our position, and opened fire as we fell back a short distance to re-arrange our shattered ranks and get something to eat, which we were sadly in need of. When darkness came on we dropped from exhaustion.

About midnight, after twenty hours of constant fighting, Lee withdrew from the contest, leaving the Angle in our possession. Thus closed the battle of the second day at Spotsylvania.

On the 13th, early in the day, volunteers were called for to bury the dead. The writer volunteered to assist, and with the detail moved to the works near the Angle, in front of which we buried a number of bodies near where they fell. We were exposed to the fire of sharpshooters, and it was still raining. We cut the name, company, and regiment of each of the dead on the lids of ammunition boxes which we picked up near by. The inscriptions were but feebly executed, for they were done with a pocket knife. This work ended, we went close up where we had fought on Thursday and viewed the spot appropriately called the "Slaughter Pen," or "Bloody Angle."

* Our pieces at times would become choked with burnt powder, and would receive the cartridge but half way. This fact, however, did not interfere with their discharge.—G. N. G.

A momentary gleam of sunshine through the gloom of the sky seemed to add a new horror to the scene. Hundreds of Confederates, dead or dying, lay piled over one another in those pits. The fallen lay three or four feet deep in some places, and, with but few exceptions, they were shot in and about the head. Arms, accouterments, ammunition, cannon, shot and shell, and broken foliage were strewn about. With much labor a detail of Union soldiers buried the dead by simply turning the captured breastworks upon them. Thus had these unfortunate victims unwittingly dug their own graves.† The trenches were nearly full of muddy water. It was the most horrible sight I had ever witnessed.

The enemy's defenses at this point were elaborately constructed of heavy timber, banked with earth to the height of about four feet; above this was placed what is known as a head log, raised just high enough to enable a musket to be inserted between it and the lower work. Pointed pine and pin-oak formed an abatis, in front of which was a deep ditch. Shelves ran along the inside ledges of these works (a series of square pits) and along their flank traverses which extended to the rear; upon these shelves large quantities of "buck and ball" and "minie" cartridges were piled ready for use, and the guns of the dead and wounded were still pointing through the apertures, just as the men had fallen from them.

G. Norton Galloway.

† The Confederate General McGowan officially says: "The trenches on the right in the bloody angle ran with blood and had to be cleared of the dead bodies more than once."—EDITOR.

FORCES AND LOSSES IN THE WILDERNESS CAMPAIGN.

From a careful examination of the Official Records the total effective strength of Grant's army at the beginning of the Wilderness campaign is estimated at about 118,000, and that of Lee's army at about 61,000 of all arms.

On June 1st, at and about Cold Harbor the Army of the Potomac numbered, "present for duty," 103,875. The Eighteenth Corps, from the Army of the James, added to the army on the same date about 10,000 men.

The strength of Lee's army at Cold Harbor is nowhere authoritatively stated. This also applies to the Confederate losses from the Wilderness to Cold Harbor.

The losses in battle of the Union army, as denoted by the record tables prepared by the late Colonel Robert N. Scott, may be summarized as follows:

	<i>Killed.</i>	<i>Wounded.</i>	<i>Captured or missing.</i>	<i>Total.</i>
The Wilderness.....	2,246	12,037	3,383	17,666
Spotsylvania Court House.....	2,725	13,416	2,258	18,399
North Anna and Totopotomoy.....	591	2,734	661	3,986
Cold Harbor.....	1,844	9,077	1,816	12,737
Sheridan's first expedition.....	64	337	224	625
Sheridan's second expedition.....	150	741	625	1,516
Grand total from the Wilderness to the James River....	7,620	38,342	8,967	54,929

MEMORANDA ON THE CIVIL WAR.

A Missing Confederate Cipher Dispatch.

ON the 6th of April, 1887, a statue of General A. S. Johnston, who fell at Shiloh twenty-five years before, was unveiled in the Metarie Cemetery at New Orleans. Among those present at that interesting ceremony was the Confederate ex-President, Mr. Jefferson Davis. Being called upon, he spoke in his usual controversial vein, including these words: "On the field of Shiloh he [Johnston] made but one mistake. He had planned that battle and had sent me a telegram,—which was lost,—which described it just as it was fought—the only battle in the world's history that was fought as the general expected."

In effect this is but a re-avertment of a story first broached in his "Rise and Fall of the Confederate Government," and repeated orally in one or more public addresses. In his book (Vol. II., p. 57) Mr. Davis gives the full text of a telegram from General Johnston to himself dated April 3d, 1862, which he describes as explaining the proposed Confederate "order of movement" upon Pittsburg Landing, and the concluding paragraph of which is in these words: "Hope engagement before Buell can form junction." This was immediately followed, on the same page, with a telegram which he says he sent on the 5th of April, to wit, "General A. S. Johnston: Your dispatch of yesterday received. I hope you will be able to close with enemy before his two columns meet."

This is presented, however, by Mr. Davis not as the answer to the telegram of the 3d of April, but to "one in cipher" of the 4th of April, which he declares is lost, thus strangely overlooking the fact that the closing words of his own dispatch are too clearly the echo of those of Johnston's telegram of April 3d not to be his answer thereto, as is made indisputable by the history of that telegram.

As after the 29th of March, 1862, General Johnston really exercised no active command over the army at Corinth, he either had not found it necessary to provide himself with the means of cipher communication with the Richmond authorities or had mislaid them. Be this as it may, after the conference with Beauregard and the corps commanders at the quarters of the former, on the morning of April 3d, when Beauregard explained his plan of battle, which General Johnston approved, the latter, wishing to inform Mr. Davis of the forward movement, wrote the dispatch of that date. To secure the transmission of it with essential secrecy he sent it to Beauregard for translation into a dictionary cipher (based upon Webster's school dictionary, three columns to the page) which that general had for such communications with his government. That translation I give as it exists in General Beauregard's official telegram book in its regular order of date as follows:

"CORINTH, April 3d, 1862, 3 P. M.

"TO THE PRESIDENT, RICHMOND, VA.

"General Buell 132. R. 5—156 L. 26—250. M. 20—250 R. 5—239 M. 32—111 M. 28—Columbia 43 M. 6—Clifton 252 M. 6—218 M. 26. Mitchell 32. R. 22—124. (Signed)

"A. S. JOHNSTON,
"General C. S. A."

After translation the original was returned to General Johnston, among whose papers it was found and published by Mr. William Preston Johnston, in the biography of his father, as well as by Mr. Davis, but on the part of the son, altogether unwittingly of the fact that it was the translation of the very cipher dispatch whose loss Mr. Davis had deplored, for the reason, as he imagined, that it was not only the plan of battle as Johnston had devised, but as he had fought it. On the other hand, the son adduces it as "clearly" showing that *it was the plan of battle as his father had originally devised*, but not as he had fought it; "doubtless," as he naïvely suggests, "in deference to General Beauregard's opinion in the matter, and for reasons which seemed sufficient at the time." In that biography this dispatch appears without the evidence of the hour of its transmission, and is thus and otherwise made to do duty inconsistent with the fact of that hour, to wit, 3 P. M. Here is the text of it as printed both by Mr. Davis and by Mr. W. P. Johnston:

"CORINTH, April 3d, 1862.

"General Buell in motion 30,000 strong, rapidly from Columbia by Clifton to Savannah. Mitchell behind him with 10,000. Confederate forces—40,000—ordered forward to offer battle near Pittsburg. Division from Bethel, main body from Corinth, reserve from Burnsville, converging to-morrow near Monterey on Pittsburg. Beauregard second in command, Polk the left, Bragg the center, Hardee the right wing, Breckinridge the reserve. Hope engagement before Buell can form junction.

"TO THE PRESIDENT, RICHMOND."

Mr. Davis admits that he has vainly sought to correct the alleged missing cipher dispatch of the 4th of April. In other words, the original of no such paper was among the very full files of official papers left by General Johnston; though it is a fact that they were so full as to be worth ten thousand dollars after the war to the United States government. But Johnston's papers did contain the telegram of the 3d of April—really the only cipher dispatch that was transmitted. The alleged tenor of the telegram of April 4th makes it improbable, I may add, that any dispatch revealing the plan of battle was sent.

The text of the cipher telegram of the 3d of April disposes of two myths: the one born of the bad memory of Mr. Davis as to its scope and tenor; the other, begotten in the brain of the son by an ill-grounded criticism on the part of the Comte de Paris, to the effect that the attack should not have been made, as it was, in three deployed lines parallel with the line of the enemy, but with the three corps moving in columns of attack perpendicularly to the Federal line, each corps having its own reserve. Turning his back square upon the fact that he had just been laboriously seeking to show that his father, not Beauregard, had planned the manner of the battle as well as of the march, Colonel

Johnston had claimed that his father had originally ordered the attack just as the Comte de Paris fancied it should have been ordered, but "doubtless" had been persuaded out of it by Beauregard — thus, *improving* it, considering the very claim he had just put forth that his father had designed the tactics of the battle, which therefore was improved because of his death.

Should there be a shred of doubt left in regard to the true history of General Beauregard's controlling influence and part in bringing about the Shiloh campaign, that, it seems to me, must disappear before the following telegram is dispatched, which was sent while General Johnston was marching toward Corinth for the army then urged by Beauregard:

MEMPHIS, March 15th, 1862.

TO GENERAL G. T. BEAUREGARD.

Having had the most frank of the Herms examined your letter, I mentioned it with attention. It has, however, no serious basis, that of being farther from enemy's lines.

"A. S. JOHNSTON."

That is to say, as near to the date of the battle of Shiloh as three weeks, General Johnston had regarded it as most advantageous that the Confederate concentration should take place not so near to the enemy's base as Corinth, but fully fifty miles away to the north-westward, behind the Hatchee River, and covering Memphis, according to his Bowling Green memorandum of February 7th, 1862, ready in case of defeat to retire here that town and there await a siege and capture. These are not the views, I submit, of a general who within a week thereafter would repair to Corinth with the plan of an offensive campaign fully rounded in his mind ready for execution within a fortnight, but of one bent solely upon the defensive, views perfectly consonant with his proffer of the command to Beauregard, and to withdraw his headquarters from the immediate vicinage of Confederate forces.

Thomas Jordan.

Union Sentiment among Confederate Veterans.

THE ovation to Mr. Henry W. Grady on his return to Atlanta proved how truly he expressed the feelings of his people in his New England Society speech. This feeling is not confined to the new generation who were too young to take part in the war, but it is also the well-nigh universal sentiment of the veterans who fought for "Lost Cause." For my part, it is now several years since I became convinced that it is an international feeling, not only to the whole country, but especially to us of the South, that the war ended in the removal of the incubus of slavery and the consolidation of the entire nation under one flag and one

government. We can hardly doubt that if the Union had been broken up into three or four confederacies (as it would have been after its prestige was once destroyed), they would have felt toward each other as France, Germany, Austria, and Russia feel at this day. The result would have been vain attempts to maintain a durable balance of power, continual wars, conscription, standing armies, fortifications and custom-houses on every frontier, and burdens far more grievous than those under which all Europe is now groaning. The Southern Confederacy (or confederacies), being inferior in population and resources, would have felt these burdens far more than the others. None of these new nationalities would have been strong enough to command the respect of the great European powers, which would have made America the field of their intrigues and conquests, as was attempted in Mexico under Maximilian. Instead of that, we have the grandest country and the most magnificent destinies ever vouchsafed to any people. We could not realize this while the bitterness of defeat was still fresh in our hearts, but a quarter of a century has produced a vast change in the Southern mind. An old adage says: Wise men change their opinions sometimes — fools never; and the great popular heart is almost always wise.

One thing especially should make us proud — it always gave me pleasure to boast of it when in Europe — and it is this: After passing through the most gigantic struggle that any country ever underwent, not a drop of blood was shed after the heat of conflict had ceased. Not even banishment was inflicted upon any of the vanquished, the result being that instead of creating an Ireland in the South we are now one people, united as one man for the defense and the honor of our whole country.

These opinions, formed even before I left America to follow a military career abroad, were confirmed and intensified by seeing the condition of the European masses, taxed without mercy and made "food for powder" to maintain or modify the "balance of power." Yet if they were only my individual ideas, I would hardly feel justified in proclaiming them; but I will state that in the last few years I have expressed these views to *hundreds* of my former brother-soldiers, and that of all those, *only one* failed to give them the most hearty approval — and he had been a very prominent political leader, but not much of a soldier. I have therefore good grounds for asserting that the Southern veterans who fought the war are a unit in their desire for peace and harmony and the maintenance of the restored Union, now and forever.

R. E. Colston,

Formerly Brigadier-General, C. S. A.

WASHINGTON, February 17th, 1887.

TOPICS OF THE TIME.

Lord Wolseley's Estimate of General Lee.

PROMPTED by the appearance of General Long's "Memoirs of Robert E. Lee," Lord Wolseley has followed in the trail of the expert reviewers who allude to a new book as an excuse for enlarging the subject with the fruits of their own study and observation. His critique is printed in "Macmillan's Magazine" for March, and is worthy of general perusal for two reasons: It affords a view (from the English standpoint) of the war of secession and the best-known Southern chieftain; and although it has little to say that is important or true with regard to General Lee, it sheds a flood of light on the military learning and mental strategy of the most conspicuous general in the British army.

No people are better acquainted with Lee's merits as a soldier than the Army of the Potomac. They admire also those traits of character which endeared him to his fellow-Confederates. So if Northerners cannot assist Lord Wolseley in placing him "*on an equal pedestal with that of Washington*," it is from no contempt of his abilities. The chief reason is the fact that Washington labored to create a Union of States and that Lee, with sorrow, but with greater love for a particular State, labored to divide the Union. But now that the Union he would yet have been glad to see preserved, *is* preserved, General Lee is for the whole country an American hero.*

In 1862 Lord Wolseley was a visitor at General Lee's headquarters, where he undoubtedly had opportunities of taking a studious interest in Confederate persons and affairs. He assures us frequently in the course of his paper that he has been a student of our war, and the following sentiment, alone, would point to such study as a duty for a man in his responsible position, since he says that "*the influence which the result of this Confederate war is bound to exercise upon man's future history will seem very great.*"

Lord Wolseley's enthusiasm for Lee springs from personal knowledge, for he says that Lee "*is stamped upon my memory as a being apart and superior to all others, in every way.*" But it is fortunate for Lee's fame that the admiration of his countrymen, North and South, rests upon solid facts, and not, as in Lord Wolseley's case, upon misconception of his character and ignorance of the leading events of his career. It is remarkable also that with all his admiration Lord Wolseley has not allowed his opinions to be influenced by those of his hero, even where Lee might be supposed to be an authority; nor consulted Lee's orders and reports for clues to his motives in strategy and battle. He would seem also to have imitated the traditional reviewer who found it bad method to read a book before criticising it, for certainly he has not leaned heavily on General Long for information.

* In his recent speech at Nashville, Senator John Sherman, referring to the losses and sacrifices of the war, said in part: "The courage, bravery, and fortitude of both sides are now the pride and heritage of us all. Think not that I come here to reproach any man for the part he took in that fight, or to revive in

For convenience let us catalogue some of the points in which Lord Wolseley differs from General Lee and other esteemed authorities:

1. At the outset he says that any "*unprejudiced outsider will admit the sovereign right, both historical and legal, which each State possessed under the Constitution to leave the Union when its people thought fit to do so.*" But General Lee thought differently. In a letter to his son dated January 23d, 1861 (see General Long's "Memoirs," page 88), General Lee says:

"Secession is nothing but revolution. The framers of our Constitution never exhausted so much labor, wisdom, and forbearance in its formation, and surrounded it with so many guards and securities, if it was intended to be broken by every member of the Confederacy at will. It is intended for 'perpetual union,' so expressed in the preamble, and for the establishment of a government, not a compact, which can only be dissolved by revolution or the consent of all the people in convention assembled. It is idle to talk of secession."

2. "*As I study the history of the secession war*," says Lord Wolseley, presumably with a wink at the Muse of History, "*these [Lee and Lincoln] seem to me the two men who influenced it most.*"

Whatever parallel might be drawn between the native integrity and manliness of Lincoln and of Lee, it has been accepted hitherto that Lincoln was the chief executive on one side, and that Lee, shrinking from the responsibilities of civil war, "save," as he writes, "in the defense of my native State," devoted his energies to the command of the Army of Northern Virginia, while other Southerners of great abilities wielded the executive power, and other Southern generals, whose services Lee was great enough to admire, worked faithfully under the executive power, like Lee himself, for the common cause. The early victories that nerved the Southern heart for great sacrifices were won by other men. Lee's first service in the field, in West Virginia, though wisely conservative in view of the difficulties, was a public disappointment. Later he fell heir to Johnston's good beginnings at Seven Pines, in which action the latter was severely wounded. Though almost a fruitless battle, it checked McClellan's aggressive policy, so that Lee had to do at the outset with an enemy whose ardor had subsided; who, in fact, was more concerned about his own safety and "a change of base" than about the capture of Richmond. Lee's daring campaign in the Seven Days' fighting was no compliment to General McClellan, though Lord Wolseley remembers that Lee expressed greater admiration for McClellan than for any other Union general. From this time on Lee was, without question, the chief prop to the military confidence of the South; but he was responsible only for the leadership of the Army of Northern Virginia, until—and now comes a fact for which Lord Wolseley should have the credit of accuracy—

the heart of any one the triumph of victory or the pangs of defeat. . . . No man in the North questions the honesty of purpose or the heroism with which the Confederates maintained their cause, and you will give credit for like courage and honorable motives to Union soldiers, North and South."

he "was given the command over all the Confederate armies a month or two only before the final collapse."

1. Lord Wolseley with superfluous inaccuracy strips Major Vernon of its historical associations and moves them to the Potomac to General Lee's home of Arlington, which he describes as "General Washington's ancestral property" and as "the cherished home of the father of the United States."

4. With calm civility he mentions a Confederate "error" which "led to a serious result, namely, the postponement of action for only twenty days"; and he adds that "Lee, who understood war, pleaded in favor of the government being on the term of the war, but he yielded to them." It is true that Lincoln issued a call for 75,000 three-months men, but at that time Virginia was disregarding the "call of Abraham"; nor is there any record that Lee made an opportunity to plead with Lincoln on the subject. Lee was soon after busy with the organization of the forces of the State of Virginia, that were required to enlist for twelve months or for the war. Most of them favored the longer term because public as well as military opinion favored it, and public opinion at the South was inexorable. Anybody who joined the Southern army was in effect enlisted for as long as he could get about and shoot.

5. Lord Wolseley recalls that in describing to him the constitution of his army General Lee most deplored the fact that the politicians insisted upon the officers being elected by their men. In this his lordship would appear still to have one leg on the Federal side of the line, for such things were done at the North. In Virginia, as General Lee's orders show, all field-officers were appointed, "in conformity to the ordinance of the convention," by the "Governor and Council." In fact, after the demand for field-officers had been met, there were no professional soldiers left in Virginia to fill the vacancies, even if it had been desired to do so by appointment.

6. He states that Lee in two months "created a little army of 50,000 men," though Lee's report to Governor Lee of June 15th — seven days after the State troops had been transferred to the Confederate authorities — estimates the Virginia forces at, surely, 35,000, and possibly 40,000. This error would be trivial but for the aberration to which it leads, for with this army of 50,000 in the field, Lord Wolseley adds that "in another month this army at Bull Run gained a complete victory over the Northern invaders, who were driven back across the Potomac like hordes of frightened sheep." The Union soldiers who were there remember the proclamation. But Confederates will wonder whether his lordship, in omitting to state that Johnston and Beauregard led the Confederates to that victory, intended to imply that the credit belonged to General Lee. Lord Wolseley will surely pardon a little doubt as to the meaning of his omissions when the fog of uncertainty so completely shrouds his explicit information.

Not was it the army that Lee had created which fought the battle of Bull Run. The State troops were scattered at points between Norfolk and West Virginia, and were blended with forces from other Southern States. Of the 50 regiments in the armies of Johnston and Beauregard, only 20 were Virginians.

7. Lord Wolseley offers a novel reason for the fail-

ure to follow up the Bull Run victory by seizing Washington. He ascribes it to "political considerations at Richmond," where the politicians, as he conceives, were engaged in an "attempt to allay the angry feelings of the North," while the dogs of war were being held in. Lord Wolseley evidently has not read the writings of Johnston, Beauregard, and Davis on this subject, or he would know that the political power in Richmond ascribed the failure to the dilatoriness of the generals, while they, on their part, claimed that there was a lack of resources for such an enterprise.

8. In some places Lord Wolseley's aim is more wild than in others, but he sweeps the whole horizon in the remark that "a battle to the Confederates meant a new supply of everything an army required. It may be truthfully said that, practically, the Government at Washington had to provide and pay for the arms and equipment of its enemies." To be sure, there was considerable exchange of the materials of war, and in the East, Lee's army got rather more than its share; but in the West the Confederates had to make the Eastern reckoning more than good. The Federals were wasteful of clothing, and the Confederates were economical by dint of bitter want that drove them even to the dead. Union soldiers did not covet the threadbare raiment of the Confederates, or find much use for their equipments, unless the surrendered muskets and cannon had been made by Federal means or, as often happened, were of the newest English brand.

9. "What most strikes the regular soldier," continues his lordship, "in these campaigns of General Lee is the inefficient manner in which both he and his opponents were often served by their subordinate commanders." If General Wolseley might have had another conversation with General Lee, after the war, that magnanimous chieftain would have told him something about Stonewall Jackson, Longstreet, D. H. Hill, Ewell, A. P. Hill, "Jeb" Stuart, and scores of other able subordinates who were maimed or killed in the performance of brilliant deeds. Only one opinion, we believe, prevails either North or South with respect to Lee's army: It was a splendid body of fighters, surprisingly well officered.

10. Lord Wolseley has cultivated the belief that Lee's strategy and tactics were always "everything that could be desired, up to the moment of victory, but there his action seemed to stop abruptly." True, the Confederates were not Titans. They seemed never to be wound up for more than a week or more of hard marching on scant rations, followed by two or three days of continuous battle, usually against superior numbers, which left them at the end without fresh reserves. After a terrible and exhausting victory a longing for rest seemed to overcome them. General Lee could not furnish physical strength to his men from his own sinews, but he did know how to fight them to a shadow and then how to keep them going on something that from the other side of the line looked like very thin hope. Once, as Lord Wolseley recollects, but with vagueness as to its events, there were seven days of continuous fighting near Richmond. Lee with sublime daring dashed his columns time and again upon McClellan's superior but separated forces. His losses were frightful, but the bravery and energy displayed by his troops were tremendous, and possibly might have proved fatal to his cause if McClellan had assumed the aggressive after Malvern

Hill instead of retiring six miles to a secure position at Harrison's Landing.

11. Yet Lord Wolseley exclaims: "*Was ever an army so hopelessly at the mercy of another as that of McClellan when he began his retreat to Harrison's Landing after the Seven Days' fighting round Richmond?*" For succinct ignorance, there is something unexampled in this statement. Malvern Hill was a staggering repulse to Lee's exhausted infantry, who were not able to confront McClellan at Harrison's Landing until the third day after that battle. And even then Lee withdrew, as he says, on account of "the condition of our troops." McClellan was well-nigh impregnable at Harrison's Landing. If Lee had been able to get at him there, the military situation would have improved, for the Confederates could not long stand such destructive fighting as "the Seven Days'." But Lee preferred to leave McClellan in his camp security resting at the outer gate of Richmond, while he started in the opposite direction to bowl over Pope and startle Washington.

12. Equally remarkable for visionary confidence is Lord Wolseley's next question, "*What commander could wish to have his foe in a 'tighter place' than Burnside was in after his disastrous attack upon Lee at Fredericksburg?*" Lee has explained in his reports, in effect, that he was so much pleased with the tight boot Burnside was wearing, so long as Burnside was the aggressor, that he had no thought of exchanging foot-gear with his enemy, as he surely would have done if he had attacked Burnside within range of the Union cannon on Stafford Heights, across the river. So secure was Burnside at the town that when it was proposed, on deciding to recross the river, to keep hands on Fredericksburg the council of officers believed that 10,000 men was a sufficient force for the purpose.

With less particularity but more discretion, Lord Wolseley concludes the subject with the remark, "*Yet in both instances the Northern commander got safely away, and other similar instances could be mentioned.*"

13. "*The critical military student of this war,*" says his lordship, with a fine compliment to himself, "*will, I think, agree that from first to last the cooperation of even one army corps of regular troops would have given complete victory to whichever side it fought on.*" There is something in this suggestive of Gilbert and Sullivan's "modern major-general." Inasmuch as this was an American war, it had to be fought in the American way. As neither side had a standing army of any importance, each side must create an army out of nearly raw material. But there are those who remember that American "raw material" once battled with "regular" troops, during the scrimmage of 1776, and again at New Orleans in 1815, and that the "regulars" did not then complain of the inferiority of their foes. McClellan's army had a splendid division of regulars, well officered, that did good service, but their deeds do not shine brighter than those of the volunteers on either side. It was not the need of "regular" troops which prolonged the war, but the equality of grit, and daring, and skill, and devotion to ideas. Lord Wolseley cannot "*blind himself to the hyperbole of writers who refer to these armies as the finest that have ever existed.*" It is true that they were not handled in the "regular" European fashion; for the rough, wooded country over which they fought would not permit; but will he deny that the two armies which

grappled for the death-struggle from the Wilderness to Appomattox were sufficiently "regular" as regards discipline, experience, and valor?

14. With Lord Wolseley's historical method, an anecdote or two is sufficient data for such a statement as this: "*The usual proportion throughout the war between the contending sides in each action ranged from about twice to three times more Federals than there were Confederates engaged.*" His lordship would appear to be unaware that there were Western battles in which almost equal numbers fought terrible battles with surprisingly equal losses. But to confine our examination, with him, to the Eastern armies, the records tell us that, save at Antietam, Lee always had on the field of battle within a fourth or a third as many men as his opponent, and that when he was the aggressor he was clever enough as a soldier to strike his blow with forces superior to the wing or detachment smitten; as witness Gaines's Mill and the blow on the Eleventh Corps at Chancellorsville. When Grant began his Wilderness "campaign of attrition," the Army of the Potomac was for once twice as large as the Army of Northern Virginia, and, considering the relative advantages of assault and defense and the steel-like temper of the Confederates, Grant's army was none too large for the job. But his lordship condenses his opinion of those veteran armies in this complaisant simile: "*A trial heat between two jockeys mounted on untrained horses may be interesting, but no one would ever quote the performance as an instance of great racing speed.*"

15. In repeating Lincoln's playful reply to the man who wanted the President's opinion of the number of Confederates in the field, which Lord Wolseley does "*with reference to the relative numbers employed on both sides,*" the drift of Lincoln's humor would have been more apparent if his lordship had stated a fact which has interested students of the "Seven Days' fighting." The day before the battle of Gaines's Mill Lincoln telegraphed to McClellan acknowledgment of three dispatches received the day before, and added, "The later one of 6.15 P. M. suggesting the probability of your being overwhelmed by 200,000, and talking of where the responsibility will belong, pains me very much." But McClellan on July 11th, when safely encamped at Harrison's Landing, returned to the subject with this: "Prisoners all state that I had 200,000 men to fight. A good deal more than two to one, and they knowing the ground." Lincoln did not need the after-testimony of the Confederate records to convince him that this was nonsense; and he must have been aiming at that unique incident when he waggishly said, "*Whenever one of our generals engages a rebel army he reports that he has encountered a force twice his strength. Now I know we have half a million of soldiers in the field, so I am bound to believe the rebels have twice that number.*"

16. But the most surprising of Lord Wolseley's conclusions on the Confederate war pertains to Lee's "faults," such as his "*softness of heart,*" his "*devotion to duty and great respect for obedience,* [which] seem at times to have made him too subservient to those charged with the civil government of his country"; also his appearing "*to have forgotten that he was the great Revolutionary chief engaged in a great Revolutionary war*" when "*the South could only*

under the rule of a *Military Dictator*." In their wars, his lordship is disappointed that General Lee, after obeying the command of his native State to fight for a new constitution and government, did not prove a traitor to the trust reposed in him. After this confession of the character Lord Wolseley would have preferred to find when he visited General Lee, if his lordship's choice (when there is no longer waging or dying of war) should seek to renew the acquaintance with the calm spirit that bowed its head, in honor, at Appomattox, it is to be feared the insulted chieftain would exclaim: "Insatiate Englishman, will not one Benedict Arnold suffice?"

17. Lord Wolseley has as little sympathy with General Lee's real virtues as with his illusory "faults." Apparently he is far away from any possible comprehension of a great leader raised up to command wisely and justly an army of democratic freemen. Nor can he appreciate how General Lee would feel, to know that the most famous English general of the time has written about him as though there were only one side to the civil war, and that the Confederate; and only one soldier on that side, and he Robert E. Lee.

Landscape-Gardeners Needed for America.

The architectural profession, we are told, is already crowded, and bids fair soon to be so overcrowded that even creative ability will find it hard to make a path for itself, and executive intelligence will be a drug in the market. Demand strictly limits supply in this art at least; whenever it comes to pass that there are not enough architectural commissions to "go round," some aspirants will be compelled to turn to other tasks. But, fortunately, the demand for the services of a sister-profession seems to be fast outgrowing existent sources of supply. Our landscape architects are very few, and we are yearly awakening to a clearer recognition of our need for them.

As yet we do not recognize it half clearly or half generally enough. But it is only a few years since the case was even worse with the architects themselves,—in their true estate as differentiated from the "builder." And ideas develop rapidly in America—wants and wishes define and extend themselves with marvelous celerity when once a first faint prompting has been felt. Therefore that young American will be wise in his generation who takes note of current signs and now begins to fit himself to answer the imperious call that will soon be made upon the art of the landscape-architect,—or, to use the older, equally dignified, and exacter term, the *landscape-gardener*.

It is interesting to remember that—far as it lags behind to-day in the number of its professors and in the degree of public interest which attends it—this art showed earlier promise of vitality in America than architecture. Downing wrote excellently of landscape almost forty years ago, when certainly no American had written well of brick and stone; did admirable landscape work when our building was at its very worst; and published helpful illustrations of schemes of planting side by side with the most helpless and hideous designs for cottages and villas. The Central Park, which was planned in the 'fifties, when Richardson was still at college, may be called—considering the difficulties of the site, and allowing for the incom-

plete way in which first intentions have been carried out—almost as great a work of art as any Richardson created. But the public, now so quick to recognize success in the one art, did not then, and does not now, really appreciate success in the other. As a consequence, a hundred aspirants are ready and eager to tread in Mr. Richardson's footsteps, while the path which the success of Messrs. Olmsted and Vaux ought to have made tempting remains almost untrodden by younger feet. If we name these artists, Mr. Parsons, and but one or two others, we name all who are known by repute, it appears, even to those architects who are seeking help,—certainly all who stand visibly before the public as professed landscape-gardeners, anxious to work, as the landscape-gardener always should work, hand in hand with the architect.

Yet how vast is our need for the ministrations of such men. How immense is the number and how various the nature of the tasks which should no more be intrusted to the gardener-artisan than should the construction of public buildings and beautiful homes to the carpenter or mason. A whole huge continent has been so touched by human hands that over a large part of its surface it has been reduced to a state of unkempt, sordid ugliness; and it can be brought back into a state of beauty only by further touches of the same hands, more intelligently applied. Public parks are yearly being laid out in our larger towns. Our customary schemes of village building call imperatively for the landscape-artist's help. And there is an ever-growing demand for country homes of a more sumptuous sort, where the best of architects can but imperfectly do his work if he must do it quite alone. Look at the *châteaux* of France, for instance; at the older country homes of England; at the villas and palaces of Italy, and we see how intimate a union of the two arts produced their magnificent charm. We find it hard to decide where the work of the architect ended, the work of the gardener began. But we find it easy enough to imagine how infinitely less would be the impressiveness of the architect's work had not the gardener's been as good,—had he not set off and emphasized constructed beauty by making nature beautiful about it, and helped to connect and unify the two by an intermediate arrangement of terraces, fountains, balustrades, and more or less formal plantings.

Let it not be supposed that because the landscape-architect works with and in deference to nature, he can trust the light of nature to teach him how to work. The training he needs is as long and as serious as that needed by the architect, and even more varied in its character. He must begin—since his work so emphatically demands *good taste*—by cultivating himself in every possible way, and especially by cultivating his powers of observation and that feeling for natural beauty which comes by effort quite as often as by birth. He must study botany,—must acquaint himself not only with the aspect but with the habits and needs and idiosyncrasies of all sorts of plants, and in particular of all sorts of trees and shrubs. He must know of soils and drains and exposures and fertilizers, and all such matters, as the practical agriculturist knows of them. He must study architecture in a general but not a superficial way. He must travel widely,—in his own land to see how nature works towards beauty, and in older lands to see how men have worked

with her materials and with architectural materials towards the same great end. He must go through a term of pupilage in a busy office like Mr. Olmsted's to learn how the new problems of our own day may be met, how complicated are the considerations which affect any large problem, and how fully it must be worked out on paper before a spade is lifted. He must cultivate patience and imaginative power,—for his works will grow very slowly to completeness, and their final estate will be scarcely foreshadowed in their first. And he must cultivate tact,—the art of dealing with men,—even more diligently, perhaps, than the intending architect must; for he will have to

meet and often “manage” not only the client and the artisan, but the architect himself.

All this is slow work and costly work. But most of it will be found pleasant work, provided *pleasant* is not thought a synonym for *easy*. And once well accomplished it will open a delightful life, an ample outlet for the broadest and deepest artistic endowment, and, we believe, a surely prosperous career. The day is very certainly at hand when the gardener-artisan must and will be relegated to his proper place,—beside the builder; and wise, we repeat, will be the youth who will then have fitted himself to stand in this artisan's former place,—beside the architectural artist.

OPEN LETTERS.

Church Union.*

FROM A UNITARIAN POINT OF VIEW.

THE simple truth seems to be that Christian Unity exists in America now, for any one who wants it. Those people have it who were born, out-of-doors, in the open-air freedom of the Christian church, and those also who, having been born in one or another Egypt or closed tabernacle, have had the courage to go out into the freedom of the world of God.

This would never be doubted, but that, as I dare say you have seen, people not used to the freedom of the open air are at first a little puzzled by it. It is somewhat as, on your summer “outing,” you have seen people who have been so much shut up in the winter that they do not at first enjoy the strong light of the sea-shore or the open pastures. But, indeed, they soon learn. Most people really want Christian Unity. I observe that most of your correspondents do. But some people are hand-tied, and, may be, tongue-tied, by some old shred of what is called a symbol, written in a dead language and in another time, which they are expected by somebody to subscribe in good faith. So you may see a boy on the sea-shore who wants to go into the ocean, but does not, because he is afraid to wet his clothes.

But when there is any real Christian work to do these people almost always strip off enough rags to be able to plunge into God's own infinite sea, and help the others who are doing it. At first, very likely, some stickler, or Pharisee, insists on a formula to say who may come and help and who may not. The word “Pharisee” means sectarian or lover of division. But once past this reef at the harbor's mouth, when they are all out on the infinite ocean, the initial difficulty is all forgotten. I belong to a society which had to meet many times before it could adjust the delicate balance of its formula. It discussed, even to a syllable, the language of its constitution. Finally, all were happily agreed, and it went to work. It has now been at work for nearly a generation. New members have joined it, eagerly, without so much as asking what was the language of its constitution. If they did ask, they would

not learn. For I have put away my copy so carefully that I do not know where it is, and the secretary's was burned in the Boston Fire; but fortunately he does not know that. There are no other copies. The society itself, all the same, does good work for God and for man, every day. It is judged by its fruits, as everything else is judged and must be judged, in the heavens above or in the earth beneath. And yet no man can tell in words what are the conditions of membership.

Any one who wants Christian Unity in America at the end of the nineteenth century has simply to walk out of his own house and go to work with other men in some enterprise which the good God wishes to have carried through. He will find all the unity he wants. This is nobly illustrated in the charity organization societies which are now at work in all the larger cities of the country.

A man may enter any one of these charity organization societies, whether he be Arminian, Baptist, Calvinist, “Disciple,” Episcopalian, Free-Baptist, Greek, Gentile, or Galilean, Hicksite, Independent or orthodox Friend, Jew, Karaite, or Coptic, Lutheran, Methodist, New-Church, orthodox, Presbyterian, Roman Catholic, or Reformer, Sandemanian, or Supralapsarian, Trinitarian, Unitarian, or Universalist; or, indeed, if he be one of those Variorum or Wild-Cat come-outers, the unorganized and un-creeded believers in Xavier, Yahveh, or Zinzendorf, or Et-cetera himself, who bring up the alphabet of the older and the younger churches.

All these people are eagerly welcomed in any of these practical organizations. Dr. Wayland's rule was, is, and will be, the only working rule. “Can they cast out the devils?” he used to ask. If they could, he did not push his questions further. Before the charity organization has been running three months these people are at work together, without a thought of the verbal or technical formulas by which, on occasion, they could divide into their several companies.

It is easy to say that the work of the church is better done by its several sections when they keep up a strict organization among themselves, and each lets the other sections severely alone. But this is only “say so,” and Americans are not ready or apt to believe it. They have read their own history enough to understand the lesson taught in the twelve years between 1775 and 1787, when Massachusetts governed herself, and kept

* See Professor Shields on “The United Churches of the United States,” *CENTURY* for November, 1885; also subsequent Open Letters from ministers of various denominations.

up her own army and navy; when New York did the same, and Virginia the same. The common enemies were not kept at bay as they are by the United States. Now there are so many common enemies that the United Church may well wish to act as a unit in the business of advancing against them and securing the advance of God's Kingdom. I suppose it was Dean Stanley, who, in England, first of all, devised that real Union of the Church for one purpose, which was brought about when a commission of members, from every communion, united for the Revision of the Bible. The objective result, an improved English Bible, is a great reward for that enterprise. But the great truth, that the Church can unite for such a purpose, is a result still better.

There is no lack of similar enterprises which the United Church can undertake in America. This of charity organization is one, and the result, in the harmony and good-fellowship which it brings about, is admirable. Such work might be pushed a great deal further, and will be.

Take Castle Garden, to-morrow, for an instance. There will arrive there, probably, one or two thousand exiles from Europe, perhaps five or ten thousand. If by good luck they are Mormons, they will be met at the landing by kind, intelligent, and skillful agents, who know they are coming and where they are going, who are on friendly terms with the officials, who are experienced in the whole matter. Within three hours, perhaps, of their arrival, without one hitch or jerk, they will all be on their route, under competent superintendence, to their new homes.

But what if, by bad luck, they are not Mormons? What if it chance that they are *only* "Christians"? Nay,—it may happen,—by bad luck that they are *only* sons and daughters of the good God. Is there not in the Christian church of America intelligence enough, love enough, tenderness enough, resolution enough, to treat these poor people as well as if they happened to swear by Joseph Smith's Bible, or to believe it? And if the Christians of a dozen different communions chose to unite, to maintain at Castle Garden a ministry of welcome, such as the Mormon church alone does choose to maintain there, does any one believe that the difference between Ultra-Montanism and ultra-montanism will prevent the two extremes of Christianity even from harmonizing in such an enterprise?

Or if this reader, by good or bad fortune, as he may consider it, does not live in the city where THE CENTURY is published, let him lay down this journal and look in the Police-Report in the daily paper of the city nearest to him. It is certain that he will read the names of one, two, or three poor creatures who have been sent, on the yesterday, to the nearest House of Correction. Would he not return to his CENTURY the next cheerfully if he knew, as he does not, that there was waiting at the court which sentenced these poor criminals an official minister, sustained by the United churches of that city, simply and only to go to the families of the criminals, and to make sure that punishment does not fall where it is least deserved. There is a place where Christianity, pure and simple, may be at work every day, without the slightest danger of quarrel about symbols or formula.

Such are my reasons for saying that when people want Christian Unity they can find it by going

out-of-doors. But if they prefer to live in their tabernacles or badger-skins, they will probably not find it.

Edward E. Hale.

CHRISTIANITY in the concrete, as believed and professed by the various sects calling themselves Christians, consists of Divine truth on its manward side, Divine truth on its Godward side, and the forms and observances by which Divine truth is made efficient for man's moral and spiritual well-being. Under the first head we must of course include the attributes of God so far as man is affected by them, the relation of Jesus Christ to man, the consequences of moral good and evil, and the eternal life of the soul. These all have an essential bearing upon character, furnishing man with adequate reasons for doing, and, still more, for becoming and being all that is just and true, pure and good. God's attributes are motives to trust and love, praise and prayer, obedience and service. Christ in the divineness of his humanity shows all that man can fully know of God, and all that he must be in order to make his own humanity in any humble measure Divine; and by his sacrificial life and death he in the intensity of his love makes the strongest possible appeal to man's emotional nature in persuading him to repentance, virtue, and holiness. The certainty of retribution not only works upon man's hope and fear, but — what is of ineffably more importance — it affixes to moral distinctions the seal and sanction of Omnipotent Wisdom and Love, thus making the characteristics of the right and the wrong not arbitrary and mutable, but intrinsic and indelible. The eternal life alone can attach their true value to objects of desire and pursuit in the present life, so as to give the due preponderance to the interests of man's moral and spiritual nature over those of his brief and precarious earthly being.

As to these truths there is a virtual and — when technical terms are excluded — even a verbal agreement among persons belonging to widely different Christian bodies. It might not seem so at first view. Thus the several creeds of Christendom give statements as to the nature of Christ that appear mutually inconsistent and irreconcilable; but yet the phrase "Divine humanity" expresses all that Christ can ever be to man in this world, and embodies what is felt and owned by those of every name who are conscious of Christian discipleship. So, too, the human side of all the various theories of the atonement resolves itself into this, — that there is between the deserts even of the penitent and believing soul and the pardon and blessedness for which it hopes an immeasurable distance, an impassable chasm, which can be spanned and filled in only by the mercy of God as revealed and manifested in Christ.

Still further, Christians, however far apart they seem, agree in defining the Christian character as consisting in the soul's vital union with Christ, in fine, in its conscious Christlikeness. Now this Christlikeness those who possess it cannot but recognize in every section of the visible church, and with equal distinctness and with equal beauty of holiness in Ritualists and Quakers, Calvinists and Unitarians, Romanists and Swedenborgians. What is common to them all is what they have received from Christ, and this common part of their Christianity is confessedly the greatest part, — that without which the soundest belief or the most

truly apostolic ritual would be utterly worthless. Why should not then the possession of this common element of Christlikeness constitute a bond of union that should far transcend in strength all separating dogmas and rituals?

As to the Godward aspects of Divine truth there are and there probably always will be irreconcilable antagonisms. This is the case in philosophy. From Thales till now many of the strongest minds of our race have made it their specialty; the theories have been innumerable; but in this entire field there is not a single principle or proposition established beyond controversy. The reason is that philosophy has for its scope a realm which no human mind can comprehend. In this sense the Godward side of Divine truth corresponds to the philosophy of mind and of the universe. Its subjects transcend the capacity of the human intellect. They are infinite and many-sided, while man can take in but a finite portion of a single aspect; and who knows but that his errors may often be partial truths, and falsities only because he makes them universal? But these separating doctrines, though worthy and ennobling themes for speculation, have no shaping power over character. Thus the triune conception of God—not without a philosophical basis—cannot be an aid to devotion. Every Christian, however he may formulate his theory of the Divine nature, worships God and prays to him as Father, Redeemer, and Sanctifier. So there is, no doubt, profound truth in Christ's words, "No one knoweth the Son but the Father;" but there is no possible way in which a dogma professing to solve this mystery can enhance or diminish the reverence, trust, and love which we owe to Christ. As to the atonement, there may have been governmental reasons, so to speak, on God's part for the death of Christ; but no theory concerning them can add to or take from the fervor with which he who has received the atonement, in looking at the cross, exclaims with his whole heart, "Herein is love," and expresses the mandate of that love in the simple and sweet words of the old hymn:

"Love so amazing, so divine,
Demands my soul, my life, my all."

As to the ritual of religion we can hardly expect agreement, so long as there remain several tenable theories as to the authority from which that ritual is to be derived, whether from the Scriptures, or from the church, and if from the church, at what age or from what branch of it. But that outward forms, however important, are unessential, is manifest from the fact that the spiritual influences that can come only from Christ have come through very diverse mediums, and with manifestly equal genuineness, to some through the open Bible, to others through the preaching of the Word, to this person through parental example, to that through sacraments and holy rites, to many immediately, as to all the rest mediately, from the Spirit of God, which has avenues of entrance to every soul.

Now the union possible and desirable among Christians is not the ignoring of differences in dogma or in ritual. Each theory of the philosophy of religion has its own natural and accustomed dialect, which its believers may fittingly prefer in the services of Christian worship; and attachment to the ritual which has been the special medium of spiritual benefit is as inevitable

as home-love in a well-ordered family. But the union which is both desirable and practicable is, *first*, a heartfelt recognition, without abatement or reservation, of the Christian estate of all who manifest a genuine Christlikeness; *secondly*, a cordial readiness, on the part of those of every Christian name, to work together in all means and measures for the advancement of Christian righteousness; and *thirdly*, union in worship whenever and wherever the interest of the common faith may be best promoted by such union, or must of necessity suffer detriment by the multiplication of separate churches beyond the capacity of the worshippers to sustain them honorably and usefully.

A. P. Peabody.

Applause as a Spur to Pegasus.

I LIGHTED the other day upon these things in my reading. Byron writes to Murray, his publisher:

"Dec. 10, 1819. I have finished the third Canto [of 'Don Juan'], but the things I have read and heard discourage all further publication,—at least for the present.

"Feb. 7, 1820. I have not yet sent off the Cantos, and have some doubt whether they ought to be published, for they have not the spirit of the first. The outcry has not frightened but it has *hurt* me, and I have not written *con amore* this time."

Moore, biographer of Byron, relates:

"So sensitive, indeed,—in addition to his usual abundance of this quality,—did he at length grow on the subject, that when Mr. W. Bankes, who succeeded me as his visitor, happened to tell him one day that he had heard a Mr. Saunders (or some such name), then resident at Venice, declare that in his opinion "'Don Juan" was all Grub-street,' such an effect had this disparaging speech upon his mind (though coming from a person who, as he himself would have it, was 'nothing but a—salt-fish seller'), that for some time after, by his own confession to Mr. Bankes, he could not bring himself to write another line of the poem, and one morning, opening a drawer where the neglected manuscript lay, he said to his friend, 'Look here, this is all Mr. Saunders's Grub-street.'"

Mr. Ruskin has in his "Arrows of the Chace" a striking passage about the intolerably depressing effect experienced by his friend Turner, the painter, from the disparagement with which his efforts in art were met by the public. As for Byron, in the particular case of his "Don Juan" one might perhaps well wish that his sense of discouragement had been sufficient to prevent altogether the finishing of the poem, splendid as is the iridescence of genius that plays over the surface of that dark and miasmatic water. Still, the illustration serves all the same. Immediate appreciation is a great stimulus to production, a stimulus which only the greatest can miss and yet go on successfully producing.

Shelley, I remember, dashed, dazed, browbeaten by his ill fortune with the public, obliged to be his own publisher, or at least to defray himself the expense of his publishing, exclaimed, in a fit of despondent self-reassurance, of despairing triumph, over his "Adonais" completed, "This, let the critics say what they will, this at least, I *know*, is poetry." How much costly and exhausting effort in sustaining himself for the

great task of poetical creation underlies expressions such as that from a genius such as Shelley!

Webster testified that he never before spoke in an atmosphere of such sympathy and appreciation as surrounded him on the occasion of his reply to Hayne. That atmosphere was no doubt an indispensable condition of the supremely triumphant effect of the speech. Who that has read the *memorabilia* of that remarkable man, Robert Hall, but has noticed how his great oratory was fed and supported by the praise that surrounded him.

It takes a man enormously buoyant with self-estimation, like Wordsworth, for example, to do without the help of present appreciation and sympathy. And under the inspiration of applause Wordsworth would have written better poetry than he did, merely and directly persistent through that inextinguishable sense within of his own genius which was at once the strength and the weakness of this least inspired of all real poets.

I, for my part, should like to know what the result would have been in the case of Walter Scott, had he lost for a term of years his standing with the reading public. Scott was a vastly courageous man, and he had quantity and reserve of animal spirits, the fruit of health and temperament, on which to draw for self-support against a slack time in his popularity. But I feel sure that heaviness of heart would have clogged that joyous play of the great brain had the sense haunted him that he was writing what no one would praise.

Almost ten years of his early manhood Tennyson was voiceless, chilled, as would seem, from singing, by the neglect or the contempt with which his poems had been received. Fortunately he lives long enough to outlive several of those reactions and vicissitudes of alternate challenge and acclamation which assure at length the poet's fame.

How it enhances one's estimation of the majesty of Milton, his genius and his character, that, "unchanged to hoarse or mute," he could go on, amid the ribald noise of the Restoration, to chant the great symphony of the "Paradise Lost." This, with a contemporary authority in letters like Waller to say of his work: "The old blind schoolmaster, John Milton, hath published a tedious poem on the Fall of Man; if its length be not considered a merit, it hath no other"; and with, no matter whom, to express the "general feeling of his age" in saying, "That 'Paradise Lost' of Milton which some are pleased to call a poem"!

Well, what of it all? Shall we agree together to praise more, that we may have more to praise? Doubtful wisdom. There is, in fact, praise enough bestowed, and dispraise enough. The trouble is that these, both of them, get famously ill distributed. What remedy? None. To admire wisely is one of the last triumphs of wisdom. There is at least nothing for us, but to be as wise here as possible and do our utmost to make others so. Our authors will have to get on as best they can with what chance praise, fit or unfit, falls to them. Let each man and woman live and write, as far as possible, in hope to deserve the fame that God himself pronounces lastly on each deed, and other hope of fame surmount and forget.

William C. Wilkinson.

John Tyler.

MR. JAMES O. HARRISON, on "Henry Clay," in *THE CENTURY* for December, 1886, page 182, says:

"It is well known that Mr. Tyler signalized his administration by betraying the confidence of the Whig party, by which he had been elected Vice-President. Suspicions and rumors were soon afloat that Mr. Tyler would not be true to the platform on which he was elected, and . . . these suspicions were absolutely confirmed by his own subsequent action," etc.

Messrs. Nicolay and Hay, in *THE CENTURY* for January, 1887, page 393, say:

"After the treachery of Tyler had turned the victory of the Whigs to dust and ashes," etc.

Certain facts should be recalled to the attention of your readers, in connection with the above erroneous statements, as follows:

First. There was no "platform," and none was intended or implied.

Second. The "Whig party" did not nominate Harrison and Tyler. The Harrisburg Convention which nominated these candidates, December 7th, 1839, was known at the time to be a joint convention of Whigs and Democrats, in which the Democrats accepted Harrison, while the Whigs accepted Tyler. It would be as just to accuse Harrison of "treachery" to the Democrats as to accuse Tyler of "treachery" to the Whigs. The case was one of pure political bargain, in which each side took its chances.

Third. Harrison and Tyler were agreed as to the state in which affairs were when they were elected. After Harrison's death, when Tyler became President, an entirely new state of affairs came up, in which Tyler not only had the right, but was bound to follow his Democratic principles, even to the disappointment of his Whig allies.

DALTON, GEORGIA.

The Cosmic Day.

AN OBJECTION ANSWERED.

THE objection made to the adoption of a Cosmic Day, "that it would be impossible for us to associate noon with 7 o'clock instead of 12," as stated in a recent number of *THE CENTURY*, is altogether fanciful and has no basis in fact. This assertion rests on no mere theory, but on actual personal experience. The Turks have a theory that the sun sets at the same time throughout the year, and that the apparent difference from day to day is but a popular delusion. Accordingly they have called sunset 12 o'clock, and begin reckoning the hours of the day from that point. Watches, to be correct, have, of course, to be changed every day, and are regulated by the muezzin's sunset call to prayer.

On first coming to Turkey, it seemed as if we should never become so accustomed to this anomalous method of reckoning time as to adopt it mentally as our own. But a residence of only a few months has shown how easy it is to adapt one's self to prevailing customs, even when so entirely contrary to those we have been born and bred in as is this method of chronology, and now it seems as natural to look for our noonday meal

at about 7 o'clock as six months ago it did to expect it at 12. Without any thought of former times and seasons, we breakfast (at this time of year) at 2 o'clock, take tea at 12, and if mindful of the proverbial recipe for acquiring health, wealth, and wisdom, go "early to bed" at 4 and rise at 1.

Unless the opponents of the adoption of the Cosmic Day can bring forward some more valid objection than the alleged difficulty of associating certain periods or certain acts with certain names of hours, their objections may, in the language of pleading, be dismissed as "frivolous, irrelevant, and impertinent," on the testimony of actual experience.

H. M. Jewett.

SIVAS, ASIA MINOR.

The Death of Mrs. Cartwright.

ON page 522 of the number for February there is a note on the death of Mrs. Cartwright. The meeting referred to was in charge of the Rev. Hardin Wallace, now a resident of California. By request of the Rev. John P. Brooks, editor of the "Banner of Holiness," I was at Bethel Chapel as a reporter for that paper, and I wrote the account of "Mother" Cartwright's wonderful death for that paper.

Permit me again to state the facts of her death as I witnessed it all, seated as I was not more than six feet in front of her, and with my eyes upon her at the moment. It was about two o'clock in the afternoon. Some ten persons had spoken, or given their "testimony." She was not called upon to speak, but was about to rise from her seat, when the Rev. Mr. Wallace requested her not to rise, and turning to the congregation said, "We will now listen while Mother Cartwright gives her testimony." She spoke of her long and arduous life as the wife of an itinerant Methodist Episcopal minister, of the goodness of God, of the joy and peace she then enjoyed, and with much feeling concluded by saying, "The past three weeks have been the happiest of all my life; I am waiting for the chariot." I wrote her words as she spoke them. The meeting continued in a quiet way, others speaking for about twenty-five minutes longer, when I observed that Mother Cartwright leaned her head on the shoulder of Mrs. Huett, who sat beside her, and as she did so,

closed her eyes. I arose and stepped to her seat, opened the window, and found her dead. Then it was that the Rev. Mr. Wallace said, "The chariot has arrived."

Yours truly,

Francis M. Hayes,
Pastor Methodist Episcopal Church, Colfax, Illinois.

"Shall Young Men go to Vassar? If not, Why not?"

A CORRESPONDENT of ours fails to appreciate the force of Mr. C. S. Percival's open letter with the above title in *THE CENTURY* for January. After stating that Smith, Vassar, Bryn Mawr, and Wellesley are too expensive for the poor, and at the most can only accommodate a limited number of students, she asks what is to become of the Western girl who has college aspirations, with not a single college for women west of the Alleghanies or south of Pennsylvania? Is she, she asks, to rest in the hope that time may bring to her grandchildren what she herself had craved, or ought she to bless, with reasonable men, the colleges that have thrown open their doors to women?

IN an article on "Ashland, the Home of Henry Clay," in *THE CENTURY* for December, 1886, Mr. Charles W. Coleman, Jr., suggests that Mr. Clay may have called his home Ashland in tender memory of Ashland, his native place in Virginia. A correspondent informs us, however, that Mr. Clay's birthplace was called Slash Cottage, and was not given the name of Ashland until many years after the Kentucky Ashland received its name.

Another correspondent writes that Mr. Clay did not study law with Francis Brooke, but with his brother, Robert Brooke, who was afterward Attorney-General of Virginia, and subsequently a governor of that State. The correspondence that Mr. Coleman refers to was with Francis Brooke, and not with Governor Brooke, as Mr. Coleman states.

FOR "of all times," read "of our times," in the quotation from the report of Mr. Lowell's speech, in the May *CENTURY*.

BRIC-À-BRAC.

Uncle Esek's Wisdom.

THE world has had but few teachers; a score of men have furnished us all the wisdom and philosophy we possess.

THE man who knows but little, and tells only what he knows, is a hard man to bother in a cross-examination.

IT takes the evidence of two or three witnesses to prove a man's virtues, but one is enough to fasten his vices upon him.

THE reason why there is so little real friendship in the world is because most of the compacts are based upon policy rather than upon principle.

A WEAK man is harder to steer than a vicious one,—he won't take the bits.

PITY is treacherous; most of it is a secret satisfaction that I am not so badly off as you are.

A LAZY man in a great hurry is very amusing; he is continually stepping on himself.

IF we ever do reach the top round of the ladder, we shall find it a dreadfully cold and lonesome place.

WHOEVER reasons from the heart will make many blunders, but none that will not be forgiven.

THE line between folly and wisdom is often an imaginary one, and men are often seen traveling along with one foot on each side of it.

A GREAT deal of learning has been lost, but not one single precept of wisdom.

Uncle Esek.

Mrs. Piper.

MRS. PIPER was a widow —

“Oh, dear me!

This world is not at all,” she said, “the place it used to be!
Now my poor husband, he was such a good man to provide —
I never had the leastest care of anything outside!

But now,

Why, there's the cow,

A constant care, and Brindle's calf I used to feed when small,
And those two Ayrshire heifers that we purchased in the fall —

Oh, dear!

My husband sleeping in the grave, it's gloomy being here!

The oven Mr. Piper broke, and four steers two year old,

The blind mare and the little colt, they all wait to be sold!

For how am I to keep 'em now? and yet how shall I sell?

And what's the price they ought to bring, how *can* a woman tell?

Now Jacob Smith, he called last night, and staid till nine o'clock,

And talked and talked, and talked and talked, and tried to buy my stock; —

He said he'd pay a higher price than any man in town;

He'd give his note, or, if I chose, he'd pay the money down.

But, there!

To let him take those creeturs off, I really do not dare!

For 'tis a lying world, and men are slippery things at best;

My poor dear husband in the ground, he wasn't like the rest!

But Jacob Smith's a different case; if I would let him, now,

Perhaps he'd wrong me on the horse, or cheat me on a cow;

And so

I do not dare to trust him, and I mean to answer 'No.' ”

Mrs. Piper was a widow —

“Oh, dear me!

A single woman with a farm must fight her way,” said she.

“Of everything about the land my husband always knew;

I never felt, when he was here, I'd anything to do;

But now, what fields to plow,

And how much hay I ought to cut, and just what crops to sow,

And what to tell the hired men, how *can* a woman know?

Oh, dear!

With no strong arm to lean upon, it's lonesome being here!

Now Jacob Smith, the other night, he called on me again,

And talked and talked, and talked and talked, and staid till after ten;

He said he'd like to take my farm, to buy it or to lease —

I do declare, I wish that man would give me any peace!

For, there!

To trust him with my real estate I truly do not dare;

For, if he buys it, on the price he'll cheat me underhand;

And, if he leases it, I know he will run out the land;

And, if he takes it at the halves, both halves he'll strike for then.

It's risky work when women folk have dealings with the men!

And so

I do not dare to trust him, and I mean to answer 'No.' ”

Mrs. Piper was a widow —

“Oh, dear me!

Yet I have still some mercies left; I won't complain,” said she.

“My poor, dear husband knows, I trust, a better world than this;

'Twere sinful selfishness in me to grudge him heaven's bliss!

So now,

I ought to bow

Submissively to what is sent — not murmur and repine;

The hand that sends our trials has, in all, some good design.

Oh, dear!

If we knew all, we might not want our buried lost ones here!

And Jacob Smith, he called last night, but it was not to see

About the cattle or the farm, but this time it was me!

He said he prized me very high, and wished I'd be his wife,

And if I did not he should lead a most unhappy life.

He did not have a selfish thought, but gladly, for my sake,

The care of all my stock and farm he would consent to take —

And, there!

To slight so plain a Providence I really do not dare!

He'll take the cattle off my mind, he'll carry on the farm —

I haven't since my husband died had such a sense of calm!

I think the man was sent to me — a poor lone woman must,

In such a world as this, I feel, have some one she can trust;

And so

I do not feel it would be right for me to answer 'No.' ”

Marian Douglas.

Point d'Alençon.

SOFT hair, soft hands, soft eyes — sometimes
If some caprice should move her
To pleasure in soft lace or silk.
(Ah, no, *not* in lover !)

Soft voice, soft smile, soft languid air,
Pink palms as soft — as satin
(She's so made up of this and lace,
One surely must put that in).

Soft heart ? Well, really, who can say,
Where in that bodice slender,
There could be room for anything
So foolish and so tender ?

Hearts must have room to beat, you see,
When something sets them throbbing ;
Could you imagine that *corsage*
Moved by soft sighs or sobbing ?

The *Modiste* whose thrice mystic lot
It was in this — to glove her,
Clasped all her dainty graces far,
Far closer than a lover.

She moves, and with the dear *frou-frou*
Of trailing silks and laces
There floats a fragrance as of flowers
Fresh from sweet, untrod places.

She must have culled them wet with dew ;
You almost wish she'd tarry
A moment more. My friend, it's but
Edouard Pinaud à *Paris*.

Her little *mouchoir* — Point d'Alençon —
A *gage d'amour*, its calling,
But ah ! too filmy fine a web
For love's sweet, hot tears falling.

Jabots and loops and daintiest frills
Fill all her mental spaces ;
And when she wears her tenderest look
She's dreaming of old laces.

The lace's mist about her throat,
The lace her hand caresses
As soft it falls light fold on fold
On all her charming dresses.

And after all, perhaps it is —
(How would the odd thought strike her ?)
The fitting setting for her life,
Since it is rather like her.

If it *is* Life — this filmy web ?
(One strives in vain to con it)
'Tis Life — or Lace that never had
A pattern woven on it.

Frances Hodgson Burnett.

Who Can Tell ?

WHO can tell when the winter is coming ?
Who can tell when the summer is going ?
We go to sleep when the asters are blooming,
We wake, and we find it snowing.

Who can tell when the winter is going ?
Who can tell when the summer is coming ?
We go to sleep when the tempests are blowing,
We wake, and the bees are humming.

Ernest Whitney.

Whence these Tears ?

ONE learned in Love's art
Instructed me,
Naught moved a maiden's heart
Like jealousy.
So, when from Constance' eyes in vain I sought
To win a kindlier glance,
I looked askance
Where, at her 'broidery frame, sweet Cecil wrought.

I looked, and lo ! mine eyes
Were fastened there —
I swore such art was wise —
(The maid was fair !)
Why should I turn, I said, to Constance' frown
Should this my cunning stir
But wrath in her ?
At Cecil's feet I laid my homage down !

But mark my cruel fate,
My wounded heart —
She said I'd come too late !
I cursed the art ;
For, when to Constance once again I turned,
Such was her jealousy
She'd none of me,
And all my proffered love she lightly spurned.

Margaret Deland.

Uncertain.

A LITTLE Pegasus
Will make a greater fuss
Than one of thrice his size ;
He will not pull his load ;
He will not keep the road ;
You cannot make him wise.

"Come !" with asperity,
I say, "and pull for me
My van of comic verse."
He hangs his shaggy head,
And sighs to me instead,
"I'd rather draw your hearse !"

"Where is that Sentiment
For which you last were sent ?"
I ask impatiently.
Up go his heels, and off,
And back he brings a scoff
Or foolish jest to me.

I never can foresee
What he will bring to me,
Nor where he'll choose to balk.
I scarcely dare at all
To ride him, lest I fall —
'Tis safer far to walk !

Yet — little elfin steed,
Useless in time of need,
Uncertain at all times ;
Restive, and rough, and wild,
How often you've beguiled
Dull pain away with rhymes.

"A poor thing, but mine own" ;
Then leave me not alone ;
A foolish dream is mine
Of mounting you some night
For a wild, distant flight
Where stars unnumbered shine.

Margaret Vandegrift.

THE CENTURY MAGAZINE.

VOL. XXXIV.

JULY, 1887.

No. 3.

NEARLY every season I make the acquaintance of one or more of our new flowers. It takes years to exhaust the botanical treasures of any one considerable neighborhood, unless one makes a dead set at it, like an herbalist. One likes to have his floral acquaintances come to him easily and naturally, like his other friends. Some pleasant occasion should bring you together. You meet in a walk, or touch elbows on a picnic under a tree, or get acquainted on a fishing or camping-out expedition. What comes to you in the way of birds or flowers while wooing only the large spirit of open-air nature seems like special good fortune. At any rate, one does not want to bolt his botany, but rather to prolong the course. One likes to have something in reserve, something to be on the lookout for on his walks. I have never yet found the orchid called *Calypso*, a large, variegated purple and yellow flower, Gray says, which grows in cold, wet woods and bogs, very beautiful, and very rare. *Calypso*, you know, was the nymph who fell in love with Ulysses and detained him seven years upon her island, and died of a broken heart after he left her. I have a keen desire to see her in her floral guise, reigning over some silent bog, or rising above the moss of some dark glen in the woods, and would gladly be the Ulysses to be detained at least a few hours by her.

I will describe her by the aid of Gray, so that if any of my readers come across her they may know what a rarity they have found. She may be looked for in cold, mossy, boggy places in our Northern woods. You will see a low flower somewhat like a lady's-slipper; that is, with an inflated sac-shaped lip, the petals and sepals much alike, rising and spreading, the color mingled purple and yellow, the stem, or scape, from three to five inches high, with but one leaf,—that one thin and slightly heart-shaped, with a stem which starts from a solid bulb. That is the nymph of our boggy solitudes, waiting to break her heart for any adventurous hero who may penetrate her domain.

Several of our harmless little wild-flowers have been absurdly named out of the old mythologies: thus, Indian cucumber root, one of Thoreau's favorite flowers, is named after the sorceress *Medea*, and is called "*medeola*," because it was at one time thought to possess rare medicinal properties; and medicine and sorcery have always been more or less confounded in the opinion of mankind. It is a pretty and decorative sort of plant, with, when perfect, two stages or platforms of leaves, one above the other. You see a whorl of five or six leaves, a foot or more from the ground, which seems to bear a standard with another whorl of three leaves at the top of it. The small, colorless, recurved flowers shoot out from above this top whorl. The whole expression of the plant is singularly slender and graceful. Sometimes, probably the first year, it only attains to the first circle of leaves. This is the platform from which it will rear its flower column the next year. Its white, tuberous root is

crisp and tender, and leaves in the mouth distinctly the taste of cucumber. Whether or not the Indians used it as a relish as we do the cucumber, I do not know.

Still another pretty flower that perpetuates the name of a Grecian nymph, a flower that was a new find to me last summer, is the Arethusa. Arethusa was one of the nymphs who attended Diana, and was by that goddess turned into a fountain, that she might escape the god of the river Alpheus, who became desperately in love with her on seeing her at her bath. Our Arethusa is one of the prettiest of the orchids, and has been pursued through many a marsh and quaking-bog by her lovers. She is a bright pink-purple flower an inch or more long, with the odor of sweet violets. The sepals and petals rise up and arch over the column, which we may call the heart of the flower, as if shielding it. In Plymouth county, Massachusetts, where the Arethusa seems common, I have heard it called Indian pink.

But I was going to recount my new finds. One sprang up in the footsteps of that destroying angel, Dynamite. A new railroad cut across my tramping-ground, with its hordes of Italian laborers and its mountains of giant-powder, etc., was enough to banish all the gentler deities forever from the place. But it did not. Scarcely had the earthquake passed when, walking at the base of a rocky cliff that had been partly blown away in the search for stone for two huge abutments that stood near by, I beheld the débris at the base of the cliff draped and festooned by one of our most beautiful foliage plants, and one I had long been on the lookout for, namely, the climbing fumitory. It was growing everywhere in the greatest profusion, affording by its tenderness, delicacy, and grace the most striking contrast to the destruction the black giant had wrought. The power that had smote the rock seemed to have called it into being. Probably the seeds had lain dormant in cracks and crevices for years, and when the catastrophe came, and they found themselves in new soil amid the wreck of the old order of things, they sprang into new life, and grew as if the world had been created anew for them, as, in a sense, it had. Certainly, they grew most luxuriantly, and never was the ruin wrought by powder veiled by more delicate lace-like foliage.*

The panicles of drooping, pale flesh-colored flowers heightened the effect of the whole. This plant is a regular climber; it has no extra appendages for that purpose, and does not wind, but climbs by means of its

* Strange to say, the plant did not appear in that locality the next season, and has never appeared since. Perhaps it will take another dynamite earthquake to wake it up.

Cardinal Flower

Starwort.

Yellow Snapdragon.

young leaf-stalks, which lay hold like tiny hands or hooks. The end of every branch is armed with a multitude of these baby hands. The flowers are pendent and swing like ear jewels. They are slightly heart-shaped, and when examined closely look like little pockets made of crumpled silk, nearly white on the inside, or under side, and pale purple on the side toward the light, and shirred up at the bottom. And pockets they are in quite a literal sense, for, though they fade, they do not fall, but become pockets full of seeds. The plant is a perpetual bloomer from July till killed by the autumn frosts.

The closely allied species of this plant, the *dicentra* (Dutchman's breeches and squirrel corn), are much more common, and are among our prettiest spring flowers. I have an eye out for the white-hearts (related to the bleeding-hearts of the gardens, and absurdly called "Dutchman's breeches") the last week in April. It is a rock-loving plant, and springs up on the shelves of the ledges or in the débris at their base as if by magic. As soon as bloodroot has begun to star the waste, stony places, and the first swallow has been heard in the sky, we are on the lookout for *dicentra*. The more northern species, called "squirrel corn" from the small golden tubers at its root, blooms in May, and has the fragrance of hyacinths. It does not affect the rocks, like all the other flowers of this family.

My second new acquaintance the same season was the showy lady's-slipper. Most of the floral ladies leave their slippers in swampy places in the woods; only the stemless one leaves hers on dry ground before she reaches the swamp, commonly under evergreen trees, where the carpet of pine needles will not hurt her feet. But one may penetrate many wet, mucky places in the woods before he finds the prettiest of them all, the showy lady's-slipper,—the prettiest slipper, but the stoutest and coarsest plant; the flower large and very showy, white, tinged with purple in front; the stem two feet high, very leafy, and coarser than bear-weed. Report had come to me through my botanizing neighbor, that in a certain quaking sphagnum bog in the woods, the showy lady's-slipper could be found. The locality proved to be the marrowy grave of an extinct lake or black

LADY'S-SMUCK, OR WILD ROCKET.

MEADOW BEAUTY.

tarn. On the borders of it the white azalea was in bloom, fast fading. In the midst of it were spruces and black ash and giant ferns, and low in the spongy, mossy bottom, the pitcher plant. The lady's-slipper grew in little groups and companies all about. Never have I beheld a prettier sight,—so gay, so festive, so holiday-looking. Were they so many gay bonnets rising above the foliage, or were they flocks of white doves with purple-stained breasts just lifting up their wings to take flight, or were they little fleets of fairy boats, with sail set, tossing on a mimic sea of wild weedy growths? Such images throng the mind on recalling the scene, and only faintly hint its beauty and animation. The long, erect, white sepals do much to give the alert, tossing look which the flower wears. The dim light, too, of its secluded haunts, and its snowy purity and freshness, contribute to the impression it makes. The purple tinge is like a stain of wine which has slightly overflowed the brim of the inflated lip or sac and run part way down its snowy sides.

This lady's-slipper is one of the rarest and choicest of our wild-flowers, and its haunts and its beauty are known only to the few. Those who have the secret guard it closely, lest their favorite be exterminated. A well-known botanist in one of the large New England cities told me that it was found in but one place in that neighborhood, and that the secret, so far as he knew, was known to but three persons, and was carefully kept by them.

Coming away with my treasures, my hat fairly brushed the nest of the red-eyed vireo, which was so cunningly concealed, such an open secret, in the dim, leafless underwoods, that I could but pause and regard it. It was suspended from the end of a small, curving sapling, was canopied by one or two large

leaves, was flecked here and there by some whitish substance so as to blend it with the gray mottled boles of the trees, and, in the dimly lighted ground-floor of the woods, was sure to escape any but the most prolonged scrutiny. It was not so much hidden as it was rendered invisible by texture and position with reference to light and shade.

A few summers ago I struck a new and beautiful plant, in the shape of a weed that had only recently appeared in that part of the country. I was walking through an August meadow when I saw, on a little knoll, a bit of most vivid orange, verging on a crimson. I knew of no flower of such a complexion frequenting such a place as that. On investigation, it proved to be a stranger. It had a rough, hairy, leafless stem about a foot high, surmounted by a corymbose cluster of flowers or flower heads of dark vivid orange color. The leaves were deeply notched and toothed, very bristly, and were pressed flat to the ground. The whole plant was a veritable Esau for hairs, and it seemed to lay hold upon the ground as if it was not going to let go easily. And what a fiery plume it had! The next day, in another field a mile away, I chanced upon another. On making inquiry, I found that a small patch or colony of the flowers had appeared that season, or first been noticed that season, in a meadow well known to me from boyhood. They had been cut down with the grass in early July, and the first week in August had shot up and bloomed again. I found the spot aflame with them. Their leaves covered every inch of the surface where they stood, and not a spear of grass grew there. They were taking slow but complete possession; they were devouring the meadow by inches. The plant seemed to be a species of *hieracium*, or hawkweed, or some closely allied species of the composite family, but I could not find it mentioned in our botanies.*

A few days later, on the edge of an adjoining county ten miles distant, I found, probably, its headquarters. It had appeared there a few years before, and was thought to have

* I have since learned that the plant is *Hieracium aurantiacum* from Europe, a kind of hawkweed, and that it has recently appeared in other parts of this State (New York) and New England.

escaped from some farmer's door-yard. Patches of it were appearing here and there in the fields, and the farmers were thoroughly alive to the danger and were fighting it like fire. Its seeds are winged like those of the dandelion, and it sows itself far and near. It would be a beautiful acquisition to our midsummer fields, supplying a tint as brilliant as that given by the scarlet poppies to English grain fields. But it would be an expensive one, as it usurps the land completely.

Parts of New England have already a midsummer flower nearly as brilliant and probably far less aggressive and noxious, in meadow beauty, or *rhexia*, the sole northern genus of a family of tropical plants. I found it very abundant in August in the country bordering on Buzzard's Bay. It was a new flower to me, and I was puzzled to make it out. It seemed like some sort of scarlet evening-primrose. The parts were in fours, the petals slightly heart-shaped and convoluted in the bud, the leaves bristly, the calyx-tube prolonged, etc.; but the stem was square, the leaves opposite, and the tube urn-shaped. The flowers were

an inch across, and bright purple or scarlet. It grew in large patches in dry, sandy fields, making the desert gay with color; and also on the edges of marshy places. It eclipses any flower of the open fields known to me farther inland. When we come to improve our wild garden, as recommended by Mr. Robinson in his book on wild gardening, we must not forget the *rhexia*.

Our sea-coast flowers are probably more brilliant in color than the same flowers in the

Lematis.

interior. I thought the wild rose on the Massachusetts coast deeper tinted and more fragrant than those I was used to. The steeple-bush, or hard-hack, had more color, as had the rose-gerardia and several

other plants.

But when vivid color is wanted, what can surpass or equal our cardinal-flower? There is a glow about this flower as if color emanated from it as from a live coal. The eye is baffled and does not seem to reach the surface of the petal; it does not see the texture or material part as it does in other flowers, but rests in a steady, still radiance.

It is not so much something colored as it is color itself. And then the moist, cool, shady places it affects, usually where it has no floral rivals, and where the large, dark shade needs just such a dab of fire. Often, too, we see it double, its reflected image in some dark pool heightening its effect. I have never found it with its only rival in color, the monarda or bee-balm, a species of mint. Farther north, the cardinal-flower seems to fail, and the monarda takes its place, growing in similar localities. One may see it about a mountain spring, or along a meadow brook, or glowing in the shade around the head of a wild mountain lake. It stands up two feet high or more, and the flowers show like a broad scarlet cap.

The only thing I have seen in this country that calls to mind the green grain fields of Britain splashed with scarlet poppies may be witnessed in August in the marshes of the lower Hudson, when the broad sedgy and flaggy spaces are sprinkled with the great marsh-mallow. It is a most pleasing spectacle,—level stretches of dark green flag or waving marsh-grass kindled on every square yard by these bright pink blossoms like great burning coals fanned in the breeze. The mallow is not so deeply colored as the poppy, but it is much larger, and has the tint of youth and happiness. It is an immigrant from Europe, but it is making itself thoroughly at home in our great river meadows.

The same day your eye is attracted by the mallows, as your train skirts or cuts through the broad marshes, it will revel with delight in the masses of fresh bright color afforded by the purple loosestrife, which grows in similar localities, and shows here and there like purple bonfires. It is a tall plant, grows in dense masses, and affords a most striking border to the broad spaces dotted with the mallow. It, too, came to us from over seas, and first appeared along the Wallkill, many years ago. It used to be thought by the farmers in that vicinity

that its seed was first brought in wool imported to this country from Australia, and washed in the Wallkill at Walden, where there was a woolen factory. This is not probable, as it is a European species, and I should sooner think it had escaped from cultivation. If one were to act upon the suggestions of Robinson's "Wild Garden," already alluded to, he would gather the seeds of these plants and sow them in the marshes and along the sluggish inland streams, till the banks of all our rivers were gay with these brilliant exotics.

Among our native plants, the one that takes broad marshes to itself and presents vast sheets of color is the marsh milkweed, far less brilliant than the loose-strife or the mallow; still a missionary in the wilderness, lighting up many waste places with the humbler tints of the purple.

One sometimes seems to discover a familiar wild flower anew by coming upon it in some peculiar and striking situation. Our columbine is at all times and in all places one of the most exquisitely beautiful of flowers; yet one spring day, when I saw it growing out of a small seam on the face of a great lichen-covered wall of rock, where no soil or mold was visible,—a jet of foliage and color shooting out of a black line on the face of a perpendicular mountain wall and rising up like a tiny fountain, its drops turning to flame-colored jewels that hung and danced in the air against the gray rocky surface,—its beauty became something magical and audacious. On little narrow shelves in the rocky wall the corydalis was blooming, and among the loose bowlders at its base the bloodroot shone conspicuous, suggesting snow rather than anything more sanguine.

Certain flowers one makes special expeditions for every season. They are limited in their ranges, and must gener-

C

vening primrose

Mountain Laurel.

ally be sought for in particular haunts. How many excursions to the woods does the delicious trailing arbutus give rise to! How can one let the spring go by without gathering it himself when it hides in the moss! There are arbutus days in one's calendar, days when the trailing flower fairly calls him to the woods. With me, they come the latter part of April. The grass is greening here and there on the moist slopes and by the spring runs; the first furrow has been struck by the farmer; the liverleaf is in the height of its beauty, and the bright constellations of the bloodroot shine out here and there; one has had his first taste and his second taste of the spring and of the woods, and his tongue is sharpened rather than cloyed. Now he will take the most delicious and satisfying draught of all, the very essence and soul of the early season, of the tender brooding days, with all their prophecies and awakenings, in the handful of trailing arbutus which he gathers in his walk. At the mere thought of it, one sees the sunlight flooding the woods, smells the warm earthy odors which the heat liberates from beneath the dry leaves, hears the mellow bass of the first bumble-bee,

"Rover of the underwoods,"

or the finer chord of the adventurous honey-bee seeking store for his empty comb. The arriving swallows twitter above the woods; the first chewink rustles the dry leaves; the northward bound thrushes, the hermit and the gray-cheeked, flit here and there before you. The robin, the sparrow, and the bluebird are building their first nests, and the first shad are making their way slowly up the Hudson. Indeed, the season is fairly under way when the trailing arbutus comes. Now look out for troops of boys and girls going to the woods to gather it! and let them look out that in their greed they do not exterminate it. Within reach of our large towns the choicer spring wild-flowers are hunted mercilessly. Every fresh party from town goes about as if bent upon the destruction of the species. One day, about ten miles from one of our Hudson River cities, there got into the train six young

women loaded down with vast sheaves and bundles of trailing arbutus. Each one of them had enough for forty. They had apparently made a clean sweep of the woods. It was a pretty sight,—the pink and white of the girls and the pink and white of the flowers! and the car too was suddenly filled with perfume,—the breath of spring loaded the air, but I thought it a pity to ravish the woods in that way. The next party probably made a still cleaner sweep, and because a handful was desirable, thought an awful proportionately more so; till, by and by, the flower will be driven from those woods.

Another flower that one makes special excursions for is the pond lily. The pond lily is a star, and easily takes the first place among lilies; and the expedition to her haunts, and the gathering her when she rocks upon the dark secluded waters of some pool or lakelet, are the crown and summit of the floral expeditions of summer. It is the expedition about which more things gather than almost any other: you want your boat, you want your lunch, you want your friend or friends with you. You are going to put in the greater part of the day: you are going to picnic in the woods, and indulge in a "green thought in a green shade."

When my friend and I go for pond lilies, we have to traverse a distance of three miles with our boat in a wagon. The road is what is called a "back road," and leads through woods most of the way. Black Pond, where the lilies grow, lies about one hundred feet higher than the Hudson, from which it is separated by a range of rather bold wooded heights, one of which might well be called Mount Hymettus, for I have found a great deal of wild honey in the forest that covers it. The stream which flows out of the pond takes a northward course for two or three miles, till it finds an opening through the rocky hills, when it makes rapidly for the Hudson. Its career all the way from the lake is a series of alternating pools and cascades. Now a long, deep, level stretch, where the perch and the bass and the pickerel lurk, and where the willow-herb and the royal osmunda fern line the shores; then a sudden leap of eight, ten, or fifteen feet down rocks to another level stretch, where the water again loiters and suns itself; and so on through its adventurous course till the hills are cleared and the river is in sight. Our road leads us along this stream, across its rude bridges,

through dark hemlock and pine woods, under gray, rocky walls, now past a black pool, then within sight or hearing of a foaming rapid or fall, till we strike the outlet of the long level that leads to the lake. In this we launch our boat and paddle slowly upward over its dark surface, now pushing our way through half-submerged tree-tops, then ducking under the trunk of an overturned tree which bridges the stream and makes a convenient way for the squirrels and wood-mice, or else forcing the boat over it when it is sunk a few inches below the surface. We are traversing what was once a continuation of the lake; the forest floor is as level as the water and but a few inches above it, even in summer; it sweeps back a half mile or more, densely covered with black ash, red maple, and other deciduous trees, to the foot of the rocky hills which shut us in. What glimpses we get, as we steal along, into the heart of the rank, dense, silent woods! I carry in my eye yet the vision I had on one occasion, of a solitary meadow lily hanging like a fairy bell there at the end of a chance opening where a ray of sunlight fell full upon it and brought out its brilliant orange against the dark

green background. It appeared to be the only bit of bright color in all the woods. Then the song of a single hermit-thrush immediately after did even more for the ear than the lily did for the eye. Presently the swamp-sparrow, one of the rarest of the sparrows, was seen and heard; and that nest there in a small bough a few feet over the water proves to be hers

WATER LILIES AND MARSH-MALLOWS.

—in appearance, a ground bird's nest in a bough, with the same four speckled eggs. As we come in sight of the lilies, where they cover the water at the outlet of the lake, a brisk gust of wind, as if it had been waiting to surprise us, sweeps down and causes every leaf to leap from the water and show its pink under side. Was it a fluttering of hundreds of wings,

or the clapping of a multitude of hands? But there rocked the lilies with their golden hearts open to the sun, and their tender white petals as fresh as crystals of snow. What a queenly flower indeed, the type of unsullied purity and sweetness! Its root, like a black, corrugated, ugly reptile, clinging to the slime, but its flower in purity and whiteness like a star. There is something very pretty in the closed bud making its way up through the water to meet the sun, and there is something touching in the flower closing itself up again after its brief career, and slowly burying itself beneath the dark wave. One almost fancies a sad, regretful look in it as the stem draws it downward to mature its seed on the sunless bottom. The pond lily is a flower of the morning: it closes a little after noon, but after you have plucked it and carried it home, it still feels the call of the morning sun, and will open to him if you give it a good chance. Coil their stems up in the grass on the lawn, where the sun's rays can reach them, and sprinkle them copiously. By the time you are ready for your morning walk, there they sit upon the moist grass, almost as charmingly as upon the wave.

Our more choice wild-flowers, the rarer and finer spirits among them, please us by their individual beauty and charm; others, more coarse and common, delight us by mass and profusion: we regard not the one, but the many, as did Wordsworth his golden daffodils:

"Ten thousand saw I at a glance
Tossing their heads in sprightly dance."

Of such is the marsh-marigold, giving a golden lining to many a dark, marshy place in the leafless April woods, or marking a little water-course through a greening meadow with a broad line of new gold. One glances up from his walk, and his eye falls upon something like fixed and heaped-up sunshine there beneath the alders, or yonder in the freshening field.

In a measure, the same is true of our wild sunflowers, lighting up many a neglected bushy fence corner or weedy roadside with their bright, beaming faces. The evening primrose is a coarse, rankly growing plant; but, in late summer, how many an untrimmed bank is painted over by it with the most fresh and delicate of canary yellow!

We have one flower which grows in vast multitudes, yet which is exquisitely delicate and beautiful in and of itself; I mean the *houstonia*, or bluets. In May, in certain parts of the country, I see vast sheets of it; in old, low meadow bottoms that have never known the plow, it covers the ground like a dull bluish or purplish snow which has blown unevenly about. In the mass it is not especially pleasing; it has a faded, indefinite sort of look. Its color is not strong and positive enough to be effective in the mass, yet each single flower is a gem of itself. The color of the common violet is much more firm and pronounced; and how many a grassy bank is made gay with it in the mid-May days! We have a great

INDIAN PIPE.

TRAILING ARBUTUS.

variety of violets, and they are very capricious as to perfume. The only species which are uniformly fragrant are the tall Canada violet, so common in our Northern woods,—white, with a tinge of purple to the under side of its petals,—and the small white violet of the marshy places; yet one summer I came upon a host of the spurred violet in a sunny place in the woods which filled the air with a delicate perfume. A handful of them yielded a perceptible fragrance, but a single flower none that we could detect. The Canada violet very frequently blooms in the fall, and is more fragrant at such times than in its earlier blooming. I must not forget to mention that delicate and lovely flower of May, the fringed polygala. You gather it when you go for the fragrant, showy orchis,—that is, if you are lucky enough to find it. It is rather a shy flower, and is not found in every woods. One day we went up and down through the woods looking for it,—woods of mingled oak, chestnut, pine, and hemlock,—and were about giving it up when suddenly we came upon a gay company of them beside an old wood-road. It was as if a flock of small rose-purple butterflies had alighted there on the ground before us. The whole plant has a singularly fresh and tender aspect. Its foliage is of a slightly purple tinge, and of very delicate texture. Not the least interesting feature about the plant is the concealed fertile flower which it bears on a subterranean shoot, keeping, as it were, one flower for beauty and one for use.

John Burroughs.

FRAILTY'S SHIELD.

LOOK what arms the fenceless wield,—
 Frailest things have frailty's shield!
 Cockle-boat outrides the gale
 That has shred the frigate's sail;
 Curlew skims the breaker's crest;
 Swings the oriole in its nest;
 Flower a single summer bred
 Lightly lifts its jaunty head
 When is past the storm whose stroke
 Laid the pride of centuried oak;
 Where with fire the soil was bathed
 The white trefoil springs unscathed.

Frailest things have frailty's shield:
 Here a fly in amber sealed;
 There a bauble, tossed aside
 Under ancient lava-tide,
 Meets the musing delver's gaze.
 Time the king's memorial lays,

Touching it with sportive staff,
 But spares Erotion's epitaph.

Frailest things have frailty's shield,
 Guarded by a charm concealed;
 So the gaunt and ravening wild
 Softens towards the weanling child,
 And along the giddy steep
 Safe one glideth, blind with sleep.

Art thou mighty? — Challenged Fate
 Chooseth thee for wrestling mate!
 Art thou feeble? — Fate disarmed,
 Turning, leaveth thee unharmed.
 Thou that bendest shalt not break;
 Smiling in the tempest's wake,
 Thou shalt rise, and see around
 How the strong ones strew the ground;
 Saving lightness thou didst wield,—
 Frailest things have frailty's shield!

Edithe M. Thomas.

SISTER TODHUNTER'S HEART.

BY THE AUTHOR OF "ELDER BROWN'S BACKSLIDE" AND "TWO RUNAWAYS."

HERE was an unusual excitement in Sweetwater. The new preacher, a young man of fine parts, accompanied by his wife, had arrived a few days before, delivered a most effective sermon, and had been called upon

with the promptness common to country communities where isolation renders local curiosity uncurable after twenty-four hours. The lady of the parsonage, whose husband was but lately a theological student and now engaged for the first time upon regular pastoral labors, came from the city, and dressed in a manner that was bound to win her the admiration or the hatred of half the village. Already that grand, interchangeable jury common to all communities was sitting upon her case. The term is used in a figurative sense, for the inquest was conducted from yard to yard, window to window, and even across the one street along which Sweetwater was congregated. Wherever two or three were gathered together and two of the three happened to be of the cradle-rocking order of society, Parson Riley's wife was the theme.

The climax was reached in the case when Parson Riley's wife sent out modest little notes inviting about twenty matrons to take tea with her the next day. Then the jury let the main question pass while it resolved itself into committees of one, each of which began with almost frantic anxiety to look into the question of dress. Adaptation became the order of the day, for no time remained for new garments, even if Sweetwater could have furnished them. Twenty ladies drew out from their hiding-places twenty bonnets of varied shapes, ages, and designs; twenty ladies shook to the breeze the camphored folds of twenty bombazines, alpacas, and venerable silks; and twenty pairs of hands went to work with needles, thread, hot irons, stain-eradicators, and all the household help that could be mustered, to turn the water of ancient respectability into the wine of modern style as outlined in stray magazines and described by the occasional town visitor.

So it was, then, that when Sweetwater, as very properly represented by its leading ladies, assembled in Parson Riley's modest little parlor and gazed upon itself in all its glory, a somewhat satisfied air settled over it. Poor faded little Mrs. Brown in her dingy alpaca, which everybody knew she bought nine years before

with money awarded her at the county fair for preserves and pickles, and had turned and re-turned until it was equally worn all over, smiled placidly upon Mrs. Bailey's watered silk that she wore when she was a bride, and upon the bombazine gown that Mrs. Buckner inherited from her mother, and felt thoroughly comfortable. And Mrs. Buckner's little straw bonnet, that had been in fashion twice in the fifteen years of its service, rested easy upon her own artificial knot of hair when she beheld Mrs. Culpepper's Leghorn flare-front head-gear, and noted the corkscrew iron-gray curls pinned around the severe brow of Colonel Ledbetter's wife just as they had been on state occasions for twenty years.

This feeling of comfort was greatly strengthened by the fact that Parson Riley's wife wore a plain dark close-fitting gown of some flexible material without ornamentation, and that her hair was brushed back without any attempt at the fashionable arrangements they feared would crush them. Then the little lady moved about among them with her sweetest smiles, and the nicest tea, and a little notice for each of her guests. She had observed what an "elegant young woman" was Mrs. Buckner's Samanthy, just back from Wesleyan College in Macon; and Mrs. Brown's son Tom was "handsome enough to be governor." As for Mrs. Culpepper's baby, why, it was "just too lovely for anything." She captured a very large-hearted woman entirely when she whispered to Mrs. Bailey that her husband was the finest-looking man she had seen in Sweetwater,—“excepting my Phil, you know,” she added. And this loyalty only sank the compliment deeper. Then she hurried off for a pencil, and begged Mrs. Colonel Ledbetter to give her her recipe for making the scuppernong wine she had heard so much praised, and she laid her book in the dear old lady's lap and wrote it as dictated. In an hour Parson Riley's wife was by unanimous consent established at the head of Sweetwater, and could afford to take the company in to see her lace curtains, baby and baby dresses, and all the little bric-à-brac that had been showered upon her as a bride,—without awakening a single jealous feeling.

But a storm was brewing, and its first mutterings were heard when Mrs. Culpepper thoughtlessly mentioned "Sister Todhunter."

"Sister Todhunter?" said Parson Riley's wife, looking from one to the other, a puzzled

"I WANT TO SPEAK ABOUT MRS. TODHUNTER."

expression shadowing her pretty face ; " have I met Sister Todhunter ? Dear me, can I have made a mistake after all ? " She had tried so hard to please everybody, and here was trouble at the first move.

" No, my dear," said Mrs. Culpepper promptly ; " it was I who made the mistake." But poor Mrs. Riley noted the ominous look upon the faces of several and the glances they exchanged.

" I am sure," she said earnestly, " I would have been glad to have had Sister Todhunter if I had known in time. Does she live in the village ? "

" No, dear," said Mrs. Colonel Ledbetter ; " she is a disagreeable old thing who lives out on her farm about a mile from here. You haven't lost anything by not knowing her." Mrs. Ledbetter was a power in the land, and her iron-gray curls shook in a dangerous and threatening manner as she declared herself. " She is sometimes pleasant, to be sure, but if it wasn't for her husband, poor man, who married her out of pity, although she was only a ' cracker ' and he a man of education and standing, she wouldn't be noticed."

" I think," said poor faded little Mrs. Brown meekly, " that Sister Todhunter has a good

heart, and I'm sure she always treated me kindly."

"And who wouldn't?" interposed Mrs. Culpepper, laughing. "You see some good in everybody, Salhe, and everybody sees some in you. But as for Sister Todhunter, she is better at long range."

Presently there was a movement among the ladies, and soon Parson Riley's wife, the recipient of twenty kisses and as many warm handshakes, was left alone with her empty cups and the memory of Sister Todhunter.

II.

WHEN Parson Riley heard the description of his wife's tea-party from her own lips, told with many a smile and an occasional sigh, his first resolution was to call upon Colonel Todhunter and his wife. So it was that early next morning he saddled his patient mare and ambled out to the Todhunter farm.

As Parson Riley approached the little cottage, he saw sitting on the steps a man with his chin in his hands. The first thing that impressed him was the air of extreme dejection about the individual, an air that had become more marked after he had dismounted and advanced toward the house. Rousing himself from his reveries, the individual rose slowly and fixed a pair of tired, watery blue eyes upon the parson. The clothes he wore were broadcloth, but they were faded now, and stained down the front with tobacco juice; and they shone with a polish evidently acquired, like good manners, through long wear.

"This is Colonel Todhunter, I believe," said the visitor, holding out his hand. "I am the Rev. Mr. Riley." The gentleman in the polished suit held the proffered hand as he replied, in a singularly low and sweet voice:

"You're the new parson, I reckon. You will have to speak louder; I am a little deaf."

"Yes," said the parson, elevating his voice. "How is your family?"

"What did you say?" inquired the low, musical voice, while the blue eyes brightened a little.

"How is your family?"

"Oh, very well, I believe. Come in and set down." He led the way slowly, with a slight limp, toward the little porch. As they ascended the steps Parson Riley caught sight of the figure of an enormous woman in a calico dress and a white apron, that loomed up in the doorway. She carried in her hand a broom; and a broad, square, almost fierce face with small black eyes was turned upon him.

"Mandy," said the colonel gently, "this is the new parson." "The new parson"

stepped forward quickly and extended his hand.

"My dear madam, I am glad to meet you," he said, a smile kindling on his handsome face. She looked at him suspiciously, gave him her left hand, and said:

"Howdye!"

"I hope you are well, madam?"

"Toler'ble," she replied. And then she turned her back and moved off with an elephantine amble.

"So this is Sister Todhunter," thought Parson Riley. "Well, I shall have trouble here."

The men sat down, and the conversation began. Colonel Todhunter proved to be courtly, almost womanly, in his manners, but his few opinions were ventured with a diffidence most painful, and the parson was glad when the time came to say good-day. He was about to mount his mare again when the colonel, who had followed him out, touched his arm.

"I want to speak to you on a private matter," he said softly. "Suppose we walk a little." So arm and arm they moved off. "I want to speak about Mrs. Todhunter," said the gentle voice again. "To tell you the truth, Parson, I am leading a life here that is almost unbearable, and I think you can help me.

"Mrs. Todhunter is a violent woman, Parson,—I use the term advisedly; she is a violent woman, and unless I can bring about a marked change in her character, I do not know what I shall do. She uses language toward me that is altogether unchristian-like and unbecoming. And worse; when she gets one of her spells upon her, she assaults me with anything nearest at hand. Only this morning I received several blows from her broom that have nearly lamed me. Parson,"—they had reached the friendly shelter of the barn by this time, and the colonel straightened up a little, while his eyes actually glittered,—“I am tired of this dog's life, and I want your assistance. I think if Mrs. Todhunter is formally reported to the church, and humiliated, it will bring about a change." Parson Riley's face showed his surprise, and the colonel added at once, "I have had this in mind a long time, and once I brought the matter to the mind of Parson Thompson, who preceded you,—a worthy man, but timid. He would not move in the matter. Now, will you?" Parson Riley was young and combative.

"I will," he said promptly.

"What?" The deaf man placed his hand to his ear.

"I will," shouted the parson. "Sister Todhunter shall be disciplined." The colonel looked pleased.

"I was a church-member myself once," he said softly, "but this eternal quarrel drove me out. I could not break bread feeling as I do toward Mrs. Todhunter." His chin trembled. He filled his cheeks with wind and blew it out under the pressure of his emotion. "You cannot imagine to what an extent this persecution has gone. Why, sir, there have been times when I considered my life in danger. I am not a dissipated man," he continued, resting his blue-veined hand upon the parson's shoulder and turning the blue eyes earnestly upon him, "but of course I take a julep now and then,—you understand; habits of an old-time Georgia gentleman,—and sometimes I have taken too much. I admit that Mrs. Todhunter has had some provocation in that direction, but not enough, Parson, to justify her in regarding me as a dog." His breast heaved convulsively.

"A woman," said the young man firmly, touched by the pathos and emotion of his dignified companion, "has no right to strike her husband except in the defense of her life."

"Hey?" Colonel Todhunter cupped his left ear deftly with the transparent hand.

"I say a woman has no right to strike her husband —"

"Why, bless your soul, Parson, that's a small matter, a very small matter indeed!" A sad smile flitted across the lips of the speaker. "A very small matter." He fixed his eyes upon his companion with a sudden resolution. "Why, do you know, Mrs. Todhunter came near smothering me, only last week?"

"Smothering?"

"Hey?"

"Came near smothering you?"

"Yes, sir. To tell the truth, Parson, I was a little mixed,—had taken a little too much, you understand. Had been camping out a week down at Bloomley's mill with Colonel Ledbetter and others, fishing, and drank a little too much. Unfortunat'ly I came home a little under the influence of stimulants, and found Mrs. Todhunter on fire about the cotton being in the grass. As I was preparing to lie down, being also ill, Mrs. Todhunter, with her superior strength and weight, forced me between the mattresses and sat down on me. And there she sat, Parson, three hundred pounds, and it a July day, and knitted all the afternoon. 'I'll sweat that whisky out er you,' she says; and she did. The perspiration that exuded from my pores soaked through the mattress and dripped on the floor. I do not know how I lived through it." He drew out his handkerchief and wiped his forehead, to which the memory of his sufferings had actually brought the moisture. "When

will you move in the matter?" he asked more cheerfully.

"At once."

"Hey?"

"At once. I'll have her up next Sunday —"

Parson Riley paused. The vast presence of Sister Todhunter had passed around the corner of the barn. There was a painful silence of about two seconds, and then her voice arose.

"So," she said loudly, with her eye on the colonel, who started as though shot, "so! *This* is your game, is it? tellin' lies on your wife to every stranger that comes along. I'll teach you better manners, if I have to break every bone in yer soft, cowardly body." She made a rush at her offending lord, which he easily and promptly avoided by stepping briskly away, leaving his late companion to hold the field as best he might.

"Madam," said Parson Riley, raising his hand as if about to ask a benediction,—it was his most impressive attitude,—"I beseech you to remember that this gentleman is your husband and that you are a member of my church —"

"What have you got to do with hit, you little chick'n-eatin' thing you?" She had turned upon him with war in her eye and war in her whole make-up generally. "A pretty sort er parson you air, ain't yer, hangin' roun' decent women's houses list'nin' ter lies an' slanders. Oh, I know what he wants; he wants ter git me up 'fore Moun' Zion Church. He tried hit on ole Thompson, but *he* daresn't move er peg. I tole him, an' I tell you, ef they have me up 'fore Moun' Zion, hit'll be er bad day fur Moun' Zion." She shook her clinched fist at him.

Parson Riley was half Irish, a little Welsh, and the rest American. Besides, he was young and inexperienced.

"Your case will be up next Sunday mornin'. You can come or not, as you please." He said this with a somewhat unclerical but very natural emphasis, and, turning on his heels, left the spot. The last words he heard were, "I ain't 'feard o' you ner all the Moun' Zions in the world."

As Parson Riley mounted his mare, Colonel Todhunter crawled through the hedge a few yards off, looked cautiously around, secured his pipe from the porch, and went back silently the way he came. A smile forced itself upon the lips of the young preacher, and a little farther down the road he laughed outright.

III.

SUNDAY morning brought an enormous crowd to Mount Zion Church, as the village

edance was called. This was natural, as on that day the Presiding Elder was to deliver a sermon, and a visit from the Presiding Elder of the district always drew a crowd. But the fact noised about throughout the land, that Sister Todhunter had been summoned and was to be tried, also operated powerfully as an assembling factor, and many people who had long neglected their church duties put in an appearance. Farmers for miles around came bringing their wives and daughters in their wagons. Young men in buggies with their sweethearts were numerous, and the grove about the church was full of vehicles and "tied-out stock" when service time arrived.

About ten o'clock a sudden movement around the doorway indicated that preaching was about to begin, and the congregation filed slowly within, the men to the left, the women to the right. Parson Riley, sitting in the pulpit with the portly form of Elder Hamlin beside him, watched with an abiding interest the faces of the comers. When the last was in and settled, he heaved a deep sigh of relief,—Sister Todhunter was not present; she was going to remain at home and let the trial go by default.

He did not know Sister Todhunter!

Elder Hamlin at last arose, his red countenance glowing like a beacon above the sea of faces, and in a voice like a trumpet's opened the meeting with prayer. He asked Divine blessing upon Mount Zion, Sweetwater, and the remainder of the world, invoking a helping hand for "the b-r-r-a-v-e young soldier of the cross" who had "come among these people to battle for the right," and upon "the young woman, just buddin' into matoority," who had "come to share his trials and minister with him." His prayer concluded with an appeal in behalf of the erring sister whose wrong-doings they were about to consider.

"May she be led to see the error of her way," he said, "an' turn her feet into the strait an' narrow path." And he thanked the Lord for the assurance given in those lines which declare that

"while the lamp holds out to burn
The viles' summer may return."

Elder Hamlin ceased, and amid the shuffling of feet that followed the deep "Amen" which rolled from the prompt "Amen corner" back into the dilatory recess beyond the last post, the congregation resumed their seats. Then Parson Riley stepped forward, and in the clear debating-society tones his wife loved so well, read the opening hymn:

"From Greenland's icy mountains,
From India's coral strand."

Elder Buckner stood up in advance of the congregation and raised the tune in a strong baritone that at once sprang out boldly and challenged the whole assembly. He was instantly pursued and overtaken by Mrs. Culpepper's soprano, and Mrs. Buckner's sweet contralto soon found an entering place. After her came the deep bumble-bee bass of Colonel Ledbetter, who adjusted his gold-rimmed glasses as he came in. This was the customary opening. No one in Sweetwater would have dreamed of invading the melody with any sort of a voice until Elder Buckner, Mrs. Culpepper, Mrs. Buckner, and Colonel Ledbetter had obtained a fair start. Any one so imprudent would have drawn the attention of the whole congregation upon himself. But the quartette well under way, everybody was at liberty to rush in; and so on this occasion, soon, borne aloft by the united voices of the entire congregation, the grand old melody sailed out and swept far away down the pine aisles into the peaceful Sabbath heart of the woodlands.

The last tone died away—as usual it was the deep hum of Colonel Ledbetter's bass, which refused to be quieted for a while. Then the congregation sank into their seats, and Elder Hamlin stood up and delivered a powerful sermon upon the wife and her true position.

Then came the long-looked-for moment.

Parson Riley had descended from the pulpit to state the business of the hour, which every one awaited with feverish impatience, when a form filled the doorway, and Sister Todhunter, in holiday attire of red silk, black lace, and a great flower laden flare-front bonnet, stood before him. As by instinct everybody knew she was there, and every head save one was turned toward her. She paused long enough to survey the crowd contemptuously, then with a great waddle she marched up the aisle, took a chair out from under little Major Brown almost before he could vacate it, placed its back against the pulpit, and sat down.

"Now," she said, looking at Parson Riley while she adjusted the folds of her dress, "go on with yer lies; I'm ready." Parson Riley turned pale and then red. Some of the thoughtless young people snickered, and there was a general stir of expectation. Colonel Ledbetter, without unbending a particle of his enormous and ever-blooming dignity, looked at Major Brown and winked with both eyes. Brown put his hand over his mouth and coughed violently. But the parson soon rallied, and turning to the congregation said firmly:

"Brothers and sisters, for such you are in the holy union of the church, and I trust soon to say in the affection born of joint and

self-sacrificing labors, I have a painful duty to perform this morning, one that I fain would avoid, but ——”

“Oh, shucks, say what yer got ter say and don't palaver so much.” This, of course, came from Sister Todhunter. He paused a second for the new sensation to subside, and without looking at her he continued:

“It is a duty, and of such there can be no avoidance without guilt.”

“Very pretty. B'en all the week er learnin' hit?”

“I am called upon to present to you this morning an erring sister,” he continued, linking his hands together and bowing them before him palms downward while he rocked back upon his heels and brought his toes to the ground again, “who, not satisfied with violating at home the proprieties of the domestic circle and the commands and precepts of the Scriptures, has come into the house of the Lord defiant and rebellious, with sneers upon her lips and contempt for his minister and his people in her heart. The evidence of this latter is before you; of the former, her husband, a gentleman whom you all know, will speak.”

Colonel Todhunter was sitting on the front seat at the elbow of Parson Riley, his chin upon his shirt-front, and deep dejection written in every line of his face. There was also a pallor there. He was probably the only person in the church who had not seen or heard his wife enter. The parson was forced to rouse him with a touch.

“Get up, Colonel,” he said, “and state your case.”

“Hey?” The parson motioned to a spot in front and then to the sea of expectant faces turned toward him. He understood, and sidled along with his white face to the crowd, his blue eyes searching every bench, until he reached the place indicated; then he folded his poor white hands together and drew a long breath of relief: Sister Todhunter was not in sight. He opened his mouth to speak, when an event occurred that threw the crowd present into the most intense excitement. In moving to the front Colonel Todhunter came within four or five feet of his wife, to whom his back was half turned. He had just satisfied himself that he was secure, and had said “I,” when Sister Todhunter leaned forward, extended her crooked-handled umbrella its full length, deftly hooked it in the collar of her husband's coat, and with one jerk landed him backward and head-first into her lap. So sudden was the act, so utterly unexpected, that everybody for an instant paused and gazed in open-mouthed astonishment. Then those in the rear tumbled over each other for better positions, and big Elder Hamlin rushed to the

colonel's assistance. The angry woman met the rescuer with such energy that his alarmed neighbors were compelled to lead him outside and pour water on his head.

In the mean time Major Brown, Colonel Ledbetter, Elder Buckner, Mr. Culpepper, and others were struggling to release Colonel Todhunter, whose convulsive play of legs and awful expression of face indicated approaching dissolution. The united strength of six men was sufficient at last to effect this, and the colonel, all breathless, arose.

“Are you hurt much, Colonel?” shouted good Mrs. Buckner, who had crowded to the front. With one hand on his head and the other struggling for his handkerchief, which was in the wrong coat-tail pocket, and with tears rolling down his cheeks, he replied softly:

“I had only a little hair left, gray hair, madam; I fear she has pulled that out too.”

The hubbub was indescribable, and everybody was crowding to the front. Parson Riley waved them back.

“Sit down,” he shouted. “We can't do anything so long as you stand up!” All dropped back into their seats, except about a dozen of the most trustworthy and dignified churchmen around the refractory sister, who with a strong grip on the edge of her chair was holding her position, while she talked to the men nearest her.

“You think yerself mighty smart, don't yer?” she said, catching Parson Riley's eye. “An' yer wife — my! ain't she stuck up, with her lace curtains an' tea-parties! Too proud ter invite *me*, but not too proud ter invite old Jane Gramby, whose boy stole a mule.” There was a shriek in the audience, and Mr. Gramby, standing near, hurried to his wife.

“An' there's Tom Culpepper. *He's* er pretty nice one to be settin' hisself up fur er church-cleaner. I saw him pass my house so drunk las' week he didn't know if he was goin' home er comin' back.” Again the thoughtless giggled. Tom Culpepper's habits were certainly unfortunate.

“An' there's Brother Spikes. He's er good han' ter weed out er church, ain't he? An' his cotton in the grass so bad that yer can't see hit from the road.” Again a subdued applause from the great audience.

“This is simply outrageous,” said Brother Spikes to Mr. John Edgerly hotly; “that woman ought to be ducked.”

“Ought she, indeed!” said Sister Todhunter, catching the remark. “Then you better git John Edgerly ter help you. His gra'ma was ducked for tattlin', en I reckon he'll know how ter go about hit.” This terrible dig drew all eyes upon Edgerly, and he turned as red as a turkey-comb.

"ANOTHER FIERCE STRUGGLE ENSUED AT THE WAGON."

"Madam," said Colonel Ledbetter, advancing to a prominent position in all the dignity and confidence of his high standing in Sweetwater, "I trust you will let your old friend advise you."

"When did you come to be my old friend?" she replied with terrible sarcasm. "Was hit when yer charged me twelve per cent. for the loan of er hundred dollars, or was hit when you made me pay for er hundred bushels of corn because my mule et five?" Taking his hat and cane, the colonel walked outside and sat down on a stump.

"Gentlemen," said Parson Riley suddenly,

seeing his force rapidly falling away, "the only thing to do is to carry her out and send her home. If you will all take hold we can carry her out quickly." The men were ready for any escape from the merciless lashing the woman was giving them. With a rush they seized her, chair and all, she fighting desperately, and bore her outside. After a brief rest, during which the assaulting party repaired damages, they lifted her again and made for the wagon. The rail fence furnished her a hold when they tried to lift her over, and it became necessary to take it down. Then another fierce struggle ensued at the wagon. Finding herself overmatched,

"ELDER HAMLIN OVERBOARD."

Sister Todhunter gave vent to a shrill scream that brought Colonel Todhunter to her side in repentance and alarm. He attempted to soothe her, but she was no sooner lifted into the wagon than she kicked the dash-board off and seized him by the ear. It took the efforts of the crowd again to release him. Elder Hamlin, who had recovered his wind and rallied, here climbed into the wagon with the others to help hold her, while the rest hitched up her mules. Then, led by Billy, her ten-year-old son, who had watched the proceedings in sullen silence, the strange load moved off, a delegation accompanying it to keep things straight. As they crossed the creek, Sister Todhunter by a sudden movement managed to throw Elder Hamlin overboard. He stood up in the water and swore a great round oath that horrified everybody. But Sister Todhunter laughed hysterically.

"Put him out, put him out er Moun' Zion too! Don't yer hear him er cussin' back there?" Elder Hamlin had retired to the bank, and was denouncing the whole race of obstreperous women, but not swearing. His one oath was confessed in open meeting afterward, and willingly forgiven.

This, however, was Sister Todhunter's last effort. She was seized with a collapse on reaching home, and begged to be placed on the grass. There sitting, she declared that death was near, and begged them to leave her. Her husband came up and ministered to her, and she was heard to ask Billy to lead her to the well, as she wanted to jump in and end her misery; and Billy told her he wished she would. Then the committee returned. It transpired afterward that Sister Todhunter rallied enough to go into the house, and, in a sudden return of her passion, slammed the door on the neck of Colonel Todhunter, who incautiously looked in, and held him a prisoner until a mutual understanding was effected. As may be well understood, the terms were not liberal for Colonel Todhunter.

IV.

OF course Sister Todhunter was summarily expelled from the church. The affair furnished Sweetwater with a sensation for several weeks, but by and by it grew to be an old topic, and Sister Todhunter could venture into town upon her shopping without attracting universal attention and comment. She was a cash customer, a fact that helped wonderfully to gain her defenders, and, besides, many people regarded her as victorious in the church fight, and enjoyed the way she laid about her. But there was no friendship between the female side of Sweetwater and Sister Todhunter. She had talked too plainly.

READER, did you ever see a baby fade away without apparent cause, baffling the oldest physicians and wringing the very life from its mother, hour by hour, day by day? — watch its poor little face grow old and pinched, and its great eyes grow brighter until they seemed

to burn like candle-flames in the empty sockets? So faded the little babe that nestled in the depths of its soft nest when the parson's wife showed the assembled matrons of Sweet-water her laces and curtains in the shadowed room back of the parlor. Day by day the mother sat in her low rocker, her tender eyes upon the wasting form, a fever in her own brain, and a weight upon her heart that had driven out every tear-drop and left her powerless to weep. By day and by night she sat there, bathing the babe in the dry grief of despair. The little frame lay bared before her—legs of a thumb's thickness, with the skin crumpled upon them, arms that were the arms of a doll, and hands that scarce checked the light that fell upon them when the mother lifted them again and again in her mute despair.

The doctor had yielded up hope: save one or two, the neighbors, worn out, had withdrawn; and to-day, the day of which I write, the mother sat waiting for the rustle of the angel's wing.

As there she sat, suddenly the doorway was darkened, and Sister Todhunter from the mountain of her awful presence looked down upon the scene.

"Why hadn't you sent for me?" she said bluffly. Parson Riley's wife looked up and then back again. She did not comprehend that she was addressed. Sister Todhunter looked at the baby. Then she ran her hands under it gently and raised it, pillow and all. 'Twas but a feather's weight. The mother yielded meekly, and fastened her eyes anxiously upon the great rescuer who had arrived.

"Is there any hope?" she asked humbly.

"Hope?" Sister Todhunter gave her a look of scorn. "I should say so! I've seen many er sicker kitten 'n this git well. Go git me some mullein."

"Mullein?"

"Yes, mullein. Don't yer know mullein when you see hit?" Parson Riley's wife shook her head sadly.

"I have never seen any," she said.

"Well, go an' tell the cook ter bring me some. Lord, what sorter women will the nex' set be! Never seen mullein!" But the mother was gone, and the lady who had been keeping her company turned up her nose and silently followed her. The cook had heard of mullein, fortunately, which grows wild in all Georgia, and soon appeared with some.

"So," said Sister Todhunter contentedly when she saw it. "Now go make some strong tea outer hit. Make hit with milk." The cook hurried away. Everybody seemed to gain life when Sister Todhunter took command.

The tea soon arrived, and the new nurse administered a couple of teaspoonfuls.

"He can't retain anything a moment," said the mother; "it is no use to torture him any more."

"Will yer hush?" Sister Todhunter almost shouted the question. "Don't yer reck'n I've seen er sick baby 'fore now?"

Parson Riley's wife "hushed" and became a mute observer. The child retained the food, and presently Sister Todhunter gave it more. The second time its eyes were fixed upon the cup, and its little lips were feebly raised to meet it. It drank half a cupful, then turned its face on Sister Todhunter's broad knee and slept. Seeing this, a great hope grew in its mother's heart and peered like an imprisoned spirit through her anxious eyes. Metaphorically she began to lean upon the vast figure by her side, which seemed so confident and resourceful.

"Lay down," said Sister Todhunter bluntly, looking up into the face fixed so hungrily upon

"THE TERMS WERE NOT LIBERAL FOR COLONEL TODHUNTER."

hers. The young woman's eyes grew wistful and beseeching.

"I can't sleep," she said, "and my baby dying." Sister Todhunter gave her a peculiar look.

"Of all the fools!" she began, then changed her mind. "Lay down right there on the bed

"I'VE SEEN MANY ER SICKER KITTEN 'N THIS GIT WELL."

an' watch me. The baby ain't er dyin'." And moved by some strange power, the mother obeyed.

The baby slept. One, two, three, four hours passed. Then it waked. The warm mullein and milk was ready, and it drank again. Again it slept. And the mother lying there silently drifted away into dreamland too, for the first time in many days, and slept the sleep of exhaustion.

Thus Parson Riley found them in the almost soundless twilight, when, hurrying back from the deathbed of a distant friend who had sent for him, he tiptoed into the room. If he had been confronted with Beelzebub himself, he could not have been more astonished. He gazed upon the sleeping wife and burly

nurse in whose broad lap slumbered the little one he loved better than life, but whom, as he rode homeward through the lonely pine-lands, he had yielded up to its Maker. His face flushed. The woman raised one hand, swept a glance over the two sleepers, and then motioned to the door. Parson Riley bent his head and noiselessly passed out. He stood among the jasmines at his gate, with his pale face turned up to the blue sky which seemed so near him there, making no sound; and it seemed to him as he waited that a mystery was unfurled about him, and he grew and broadened under its touch.

Still the suns glided by, but the child lived — lived and grew strong. One day Colonel Todhunter drove the mules up to the front

door and halted them. Sister Todhunter placed the infant in its mother's lap and said:

"Keep him on mullein and milk a while longer. He's all right now.—Shet up!" she added, seeing the mother's eyes fill with tears and her bosom heave; "an' if yer need me, sen' down."

"You saved my child," sobbed Parson Riley's wife, "and I'll pray for you always."

"Me saved him! That's er pretty thing fur er preacher's wife ter say! The Lord did it, chile,—the Lord and his mullein tea." She nearly crushed the life out of Parson Riley in her hurry to get out.

"Mallam," he began, seizing one of her hands.

"Shet up!" she replied, snatching it away. He looked at her beseechingly.

"Won't you let me thank you?" he said; "and — won't you let me say something about that other matter?"

She laughed. "Not now, Parson. I'm goin' home, an' the Lord knows how I will find things there, fur 'twixt Billy and Mr. Todhunter the chances fur ther goin' wrong is the

bes' in the worl'. But, Parson, you *can* study on supp'n. When yer go ter turn ernother woman out of er church, don't yer go ter the neighbors fur her character, nor ter her husband, if he happens ter be a trillin' kind er man; but come straight to headquarters. Trouble and worry sometimes sorter crusts over er woman's heart, so that ev'ybody can't see hit, Parson, but hit's there all the same." She got upon the block and clambered into the wagon, where in deafness sat her liege lord. "Good-bye, Parson," she said, as they drove off. "I'm glad ther baby's mendin'. Keep him on mullein tea." The parson lifted his hat.

"God bless you, madam," he said tearfully. He watched them as they rolled down the lane. The wheel struck a stump.

"Did anybody ever see sech er man?" he heard her shout. "Gimme them lines!" He saw the colonel rock violently as the reins were wrenched out of his hands, and then he saw his patient little hairless head with its broad ears settle down between his shoulders again. Presently a turn in the road hid them from sight.

H. S. Edwards.

POEMS BY E. R. SILL.

THE REFORMER.

BEFORE the monstrous wrong he sets him down —
 One man against a stone-walled city of sin.
 For centuries those walls have been a-building;
 Smooth porphyry, they slope and coldly glass
 The flying storm and wheeling sun. No chink,
 No crevice lets the thinnest arrow in.
 He fights alone, and from the cloudy ramparts
 A thousand evil faces gibe and jeer him.
 Let him lie down and die: what is the right,
 And where is justice, in a world like this?

But by and by, earth shakes herself, impatient;
 And down, in one great roar of ruin, crash
 Watch-tower and citadel and battlements.
 When the red dust has cleared, the lonely soldier
 Stands with strange thoughts beneath the friendly stars.

DESIRE OF SLEEP.

IT is not death I mean,
 Nor even forgetfulness,
 But healthful human sleep,
 Dreamless, and still, and deep,
 Where I would hide and glean
 Some heavenly balm to bless.

I would not die; I long
 To live, to see my days
 Bud once again, and bloom,
 And make amidst them room
 For thoughts like birds of song,
 Out-winging happy ways.

I would not even forget:
 Only, a little while —
 Just now — I cannot bear
 Remembrance with despair;
 The years are coming yet
 When I shall look, and smile.

Not now — oh, not to-night!
 Too clear on midnight's deep
 Come voice and hand and touch;
 The heart aches overmuch —
 Hush sounds! shut out the light!
 A little I *must* sleep.

THE HUNDREDTH MAN.*

BY FRANK R. STOCKTON,

Author of "Rudder Grange," "The Lady, or the Tiger?" "The Late Mrs. Null,"
"The Casting Away of Mrs. Lecks and Mrs. Aleshine," etc.

XXIII.

WHILE Mr. Crisman was engaged in setting up Miss Stull's sketching umbrella, that young lady looked upon him with much more

interest than she regarded the work which he was doing for her. He was certainly a handsome young man, and in some respects pleased her better than did Mr. Stratford. Mr. Crisman, too, proved fully equal to the exigencies of this chance meeting. He was naturally chatty and sociable, and having become intensely bored during his companionless stay at the Cherry Bridge tavern, he was delighted at this legitimate opportunity of assisting and of talking to a very pretty young lady. He did not hesitate to ask questions or to offer suggestions in regard to the sketching business, and in her answers to these Miss Matilda managed, with much deftness, to inform him who she was and where she lived, and also to make him aware that she knew who he was.

Crisman delayed his walk, and watched the sketching for some time, but at last he took up his rod. He asked her if she was coming again to this place to sketch, and she answered:

"Of course, if I do not finish this to-day I must work on it to-morrow."

When she came again on the morrow, she found Mr. Crisman there.

"I thought I would come over," he said, "and see how you were getting along with the picture." And that was all the reason or pretense he deemed it necessary to give for his presence.

Miss Stull liked this. It showed there was no nonsense about the young man; and she greeted him very pleasantly. Although she had known him but such a very short time, and although their introduction consisted of nothing but the words she herself had spoken concerning their respective identities, Mr. Crisman possessed the present qualification which in her eyes raised him above all other young men in the world: he was there.

He staid with her a full hour, during which

the drawing made little progress, but the acquaintanceship made much. John People was a simple-minded young man, while Mr. Crisman was, in many ways, extremely sharp-witted; yet Miss Matilda drew from the latter twenty times more information in regard to the persons of their mutual knowledge than she had ever been able to extract from the former. They barely mentioned Gay, for Mr. Crisman did not wish to talk about her, and Miss Stull did not think it wise to do so; but they discussed Mrs. Justin and Mr. Stratford very thoroughly, and when Mr. Crisman had finished his analysis of the character of the gentleman, Miss Stull began to perceive how very kind chance had been in sending her the fisherman she did not expect instead of the one she had been looking for.

Mr. Crisman then proceeded to give his companion a pretty good account of himself; and as this was a subject it always pleased him to talk of, he dwelt upon it to a considerable extent. He omitted all allusion to the original cause of his visits to this neighborhood, contenting himself with stating that he was at present staying here to fish and shoot,—that is, if he could ever find anything to shoot,—and that in a few days he was going on a yachting expedition, which would fill up the remainder of his vacation.

Mr. Crisman walked home with Miss Stull, carried her stool and her umbrella, went into the house, and was presented to her mother as a friend of Mrs. Justin. There was something extremely frank and straightforward in the conduct of Mr. Crisman. There seemed to him nothing strained or unusual in his making the acquaintance of the Stull family in this informal manner, and he showed a readiness to enter into any intimate social relations to which he might be invited. Mrs. Stull liked the absence of that stiffness which she often noticed in the society which her husband compelled her to enter, and, altogether, these three persons, each of whom was beginning to feel somewhat lonely in this country neighborhood, were very well satisfied with the new acquaintanceship.

Miss Stull sat by herself that evening, after her mother had gone to bed, and seriously pondered upon Mr. Crisman. She knew better

than any one who merely looked upon her, that not only were the months and years passing by her, but that a very good proportion of them had already passed, and that the period had arrived when she should begin to think seriously of some young man or other. As far as she could judge, Mr. Crisman fulfilled all her requirements. Personally he was entirely satisfactory, and, although she did not suppose he was rich, he had told her he was in a very good business, and she felt sure of this, for otherwise, in her opinion, the engagement of Gay Armatt would never have been allowed. In fact, this engagement was a strong recommendation to Miss Stull. It was as though his preliminary examinations had been passed, and she might therefore take him at a much more advanced stage of friendship than a person who had not thus been proved. That the engagement had been broken off did not trouble her at all. From what she had seen, she attributed it entirely to Mr. Stratford's agency, and if the girl preferred to marry that man instead of Mr. Crisman, she, Miss Matilda, was quite satisfied.

That her father would approve of Crisman she was not at all sure, but then her father disapproved of so many things it would not do to consider him always. If she should become engaged to this gentleman, she herself would see to it that the marriage took place at the proper time; and as she saw no good reason for any objection on the part of her parent, she felt quite sure that the name of J. Weatherby Stull would be signed to such checks as might be needed at the beginning of housekeeping. As to the future, Miss Matilda was very hopeful. She was the principal child of the family, and she did not believe that her father would dare to divert permanently from her any portion of her rightful share in his property.

Having thought over this matter for nearly two hours, she determined, unless subsequently she saw some reason for changing her mind, that she would marry Mr. Crisman, and that she must lose no time in making very good use of her present exceptional opportunities.

During the next few days, several admirable methods for enjoying the scenery and the air of the country about Cherry Bridge were suggested by Mr. Crisman. He believed these to be original suggestions, not perceiving that they were produced by the adroit and quiet working of Miss Matilda's mind upon his own. There was nothing accidental about these walks and drives; Mr. Crisman came boldly to Mrs. Stull's residence, and boldly stated what he came to propose.

Miss Stull found that the remaining days of Mr. Crisman's vacation were not sufficient for

the completion of her work, and she resolved to extend his stay at Cherry Bridge. For the day on which he was to join his yachting friends she proposed an excursion to a somewhat distant point of interest which she would never see unless she had some one like Mr. Crisman to accompany her. At first he declared that it was impossible for him to go on this excursion, but subsequently telegraphed to his friends requesting them to postpone for a day their start for the yacht trip. On his return from his drive with Miss Stull he found a telegram informing him that wind, tide, and friends with limited time wait for no man, and that the yachting party had sailed.

Now there was no reason why Mr. Crisman should not spend the rest of his vacation at Cherry Bridge; and there he spent it, and for the greater part of the time in the society of Miss Stull. On his side Mr. Crisman had no serious thoughts in connection with this very pleasant companionship. He enjoyed it, but he never expected anything to come of it. He expected to marry Gay Armatt, and would not have been surprised at any time to receive a note from Mrs. Justin stating that it would be in the interest of all parties if he should call at her house and see Gay, who was beginning to look at the matter in dispute between them in a different light from that in which she had first regarded it. He had not the slightest idea of making any conciliatory propositions himself; his nature was too obstinate for this; and he believed, besides, that anything in the way of "knuckling down" on his part would be injurious as a precedent to the matrimonial relations he proposed to establish. He was very willing that the people at the Justin house should see that he was not pining away on account of the rupture of the engagement, and that he did not even have to leave Cherry Bridge in order to find agreeable companionship.

And thus he wound his merry way among the subtle threads which Miss Matilda spread about him, sometimes breaking away in this direction or that, imagining the while that he was as free as a bird in the air, but carrying with him, all unknown to himself, attachments strong enough to bring him back whenever Miss Matilda wished to draw him to her. As his holidays approached their close, the lady dexterously tightened and strengthened his bonds, until one day he found himself so enveloped and secured that he could not fly, nor run, nor walk, save at the will of his captor; he was so skillfully bound, in fact, that he could not even wish to flutter. He was engaged to be married to Miss Matilda Stull.

When he discovered this fact, it was natural that Mr. Crisman should experience some sudden emotions; one of these was an emotion of

vanity : how quickly had he conquered this fine girl! He could not but think of what so lately had been,—Miss Matilda could not prevent that backward glance of his eyes,—but the thoughts of what had been were overpowered by the thoughts of what existed now. All those fond feelings towards Gay which had been cooled and hardened by his jealousy and his anger, Miss Matilda had warmed into strong glow and directed towards herself. One thing very potent in preventing Crisman from looking backward was the remembrance that never had Gay given that value to his utterances which had been so earnestly accorded them by Matilda. That deft spinner had actually spun her web over his heart. He loved her. He felt that she exactly suited him, and paying no thought to peculiarity of circumstances nor to hastiness of action, he was proud and happy that he had won this girl.

When all this had been settled and these two were pledged to each other for life, Miss Matilda enjoined upon her lover strict secrecy for the present. Nothing was to be made public until the parties should meet in the city in the autumn, and then the lady would herself attend to the announcement of the engagement to her father. She felt quite sure she would be able to make him look upon the matter in a proper light; when this was done, all else would be easy. And then she allowed Mr. Crisman to depart.

Miss Stull's next move was to inform Gay Armatt, as soon as possible, of what had happened. This was not in accordance with the injunctions of secrecy which she had imposed upon Mr. Crisman, but she considered it a necessary step, and did not hesitate to make it. Until Gay had been positively assured that her lover had gone from her forever, Matilda could not feel safe.

Miss Matilda had not seen her young friend since she had met her in the buggy with Mr. Stratford. Mrs. Justin, having heard that Crisman was still in the neighborhood, said nothing about it to Gay, but endeavored to keep her, as much as possible, at home, in order that there might be no accidental and undesirable meeting. Stratford, too, thought it would be wise at this time to leave the trout streams and the woods to the supposed irate young man, and he paid a short visit to the sea-shore. About what Crisman might do or say, should he meet Stratford, the latter attempted to form no supposition; but he desired above all things to avoid scandal regarding Gay, and therefore went away.

Miss Matilda had noticed this state of affairs, and thought that matters had been managed very wisely; but now that Mr. Crisman had gone, there was no reason why

Miss Armatt should be kept any longer in seclusion and ignorance, and she determined to see her. It is true that Miss Stull did not owe the Justin house a visit, the debt being the other way. But in the country, she argued, social rules may sometimes be set aside; and happening to be driving that way, she stopped in to see Gay. It had been so long, she explained, since she had heard from her that she feared she might be ill. It was during this interview that Miss Matilda allowed Gay to suspect, and at last actually admitted to her, that she was engaged to Crisman.

"I did not intend, my dear," said Miss Stull, "to tell you this at present, but the secret has come out almost without my knowing it. This is a queer world, isn't it, dear? People pair off this way, and then they find they have made a mistake and they pair off that way. But, so long as we are all the happier for it, we ought to be very glad. And now, my dear Gay, I want you to understand that both you and Mrs. Justin owe us a visit—I'll be generous and won't count this—and if you don't pay it very soon you'll find us standing on our dignity. So now you see what you have to expect. Good-bye, and I'm very sorry Mrs. Justin is not at home."

Gay remained standing by the chair from which she had risen when her visitor took her leave. Since the actual confession, and while Miss Matilda spoke her few concluding words, Gay had not opened her lips; and now she remained struck by a heavy pain, the nature of which she did not understand. She had sent this man away, and she ought to have known him well enough to comprehend that he would not return; why, therefore, should she feel pain at what he had done? A man who could so quickly turn his affections upon another could not be worthy of her. Why, therefore, should she now feel pain? He had treated her as no man should treat a woman; she had declined to be longer engaged to him; and he had gone to another woman. Her pride, her reason, her womanly self-respect, stood by her to comfort and support her. But, in spite of all support and comfort, she did feel pain.

XXIV.

JOHN PEOPLE had been summoned by Mr. Stull to the city, the alterations at Vatoldi's having reached a stage where the daily supervision of the manager was necessary. In the course of a week or so, however, John contrived to arrange matters in such a way as to give himself two days in which to visit Cherry Bridge. He informed Mr. Stull that there were some affairs he wished to attend

to which the somewhat unexpected conclusion of his holiday had forced him to neglect. He did not say that this neglected business was a proposition of love to Mr. Stull's daughter, but such was the fact. John fully determined that before he left his native fields again he would boldly lay the state of his heart before Miss Stull, and find out how she regarded him.

For the first day after his arrival in the country John wandered over the fields, along the roads, and in every place where he thought it might be possible to encounter Miss Matilda accidentally. But, Mr. Crisman having recently left, that young lady had gladly given herself a rest from country strolling, and John met her not. A visit to her house naturally suggested itself to his mind, but this course was repugnant to him. In the first place, he thought if he went to the Stull house eventually would know what he went for, and that he could not endure. Then again, he could not be sure of seeing Miss Matilda alone in her home, and even if he had this good fortune, he felt that in a room or on a piazza he could not speak to her as freely and eloquently as if he were with her in the open fields.

On the second morning the pensive resignation on his brow deepened into positive trouble, for it now seemed quite probable to him that fate had decreed that he should visit Miss Matilda at her home. How he should do this, at what time he should go there, how he should demean himself, what primary reason he should give for his visit, were questions which greatly preyed upon his mind. Wandering slowly along the verdant banks of Cherry Creek, he lifted up his eyes, and beheld Miss Gay Armatt approaching him. Instantly there came into his mind a happy thought. He had met Miss Armatt several times, both at his uncle's house and at Mrs. Justin's, and, by his mother's report, he knew her to be a most kind and good young woman. "Now, why should she not help me?" was John's happy thought. "I don't mind telling her just what is the matter, and if she is as kind as they say she is, it will be easy enough for her to get Matilda to take a walk with her and so give me all the chance I want."

Having come up with the young lady, John took off his hat, bade her good-morning, and stopped. Gay raised her eyes towards him as she returned his salutation, and John thought that the lady probably did not feel very well. She was not looking her best. He made some inquiries about Mrs. Justin which had the effect of arresting Miss Armatt's steps; and then, finding that he could think of no other prefatory remarks, John perceived that it would be necessary for him to say immediately what he had to say.

"Excuse me, miss," said he, "for taking your time, but I want to ask you something, and I hope you are not in a hurry."

"I am in no hurry at all," said Gay. "Is there anything I can do for you?"

"This question helped him very much. "Oh, yes, indeed," he said, "there is something you can do for me. It may seem very queer to you, Miss Armatt, for me to stand here and plump things out to you in this way; but the fact is there's no time to be lost, and what I don't do to-day can't be done at all; at least there is no likelihood of it. It will amaze you a good deal, I have no doubt, when you hear me say — and I must own that I'm amazed to hear myself say it out freely this way — that I am in love."

"In love!" exclaimed Miss Gay, and there came into her face a quick look which startled John. It seemed to him as though she might bound into the bushes and flee from his sight like a deer. Could it be possible that this young lady thought that he was about to make an amatory proposal to her?

"It is Miss Stull I'm in love with," said John quickly, "and I'm pretty sure I'll never get a chance to let her know it if somebody don't help me, and so I thought I'd ask you, thinking if you wouldn't do it for my sake, which would be natural enough, not knowing me very well, you might do it for my mother's, who looks on you and Mrs. Justin as her most valued neighbors."

It had been days since Gay had smiled, but she could not help smiling now. "I am always glad to do anything neighborly," said she, "but this seems very odd. Does your mother wish you to marry Miss Stull?"

"She just builds on it," answered John, "and I want you to know, Miss Armatt, that although this thing might look out of the way to any outside party, there's a good deal more reason for it than anybody except just two or three has any idea of. Miss Stull is the daughter of a rich man, and I am only the manager at Vatoldi's. But there are things that I can't tell you, but which will come out some day, that make matters a good deal more even between us than you would be likely to think. And I don't doubt, either, that old Stull will come round all right when the affair has been settled between me and his daughter, and has run on long enough to get seasoned."

"But what would you have me to do with it?" asked Gay.

"It's just this," said John: "This is the last day I have got to stay here, for I don't know how long, and I am bound to tell her before I sleep to-night. Now, I can't go to her house to tell her, Miss Armatt. Upon my word I can't! If I was to meet her mother or those

two young sisters, it would drive every word out of my mind. But on the green grass and under the blue sky I could tell her all I feel and think. And that is what I want to get a chance to do. Now, if you would ask her to take a walk with you this afternoon, and I was to fall in with you, and you'd think of some reason or other for being obliged to go home and leave us two there, then you'd be doing for me more than any woman on earth could do except Matilda herself, if she be so minded to say the word I want her to say."

Gay stood and looked upon the ground. This was all very unpleasant and embarrassing. Here was a young man whom she had heard of as a very good and deserving young man, who had been so unhappy as to fall in love with Matilda Stull. She did not thoroughly understand the relative social conditions of the two, but she knew that one was a rich young lady, and the other was the son of Mrs. People. These situations in life appeared quite incongruous to Gay, but she only thought of them in connection with her wonder that this love of the young man had ever been suffered to grow up. In regard to the present and important phase of the question, there was but one thing to think of, and that was that Miss Stull was already engaged.

And yet Gay could not say this to John People. She had not told Mrs. Justin, nor Mr. Stratford, nor any one, for it was not only the pledge of secrecy which prevented her from telling of this engagement; had she been free to speak, she could not have told any one that the man who but a few weeks before had been her lover had now promised to marry another woman.

"Now you see, Miss Armatt," said John, "it is a very simple thing I ask of you. Won't you be kind enough to do it for me?"

There was that in the tone and voice and look of John People which was so honest, and withal so tender, that it touched Gay's heart. There could be no doubt that this man was truly in love. Would her conscience permit her to let him hurl himself against that cold steel wall which he adored, and in which he fancied he saw a reflection of himself?

"It is a very hard thing," thought Gay, "for me to have to do this. It is just the same as if I were refusing him for Matilda Stull. People ought to attend to these things for themselves. And yet I know, and he doesn't know. Ought I to let him go on in this blind way? It would be too cruel."

"Mr. People," she said, "if I were you, I think I would not carry this matter any further. Indeed, I would not."

John looked at her very steadily, and a little of the ruddiness seemed to fade out of his

face. "Why do you say that, Miss Armatt? Have you any reason to think that I ought not to speak to her?"

"Yes," said Gay, "and a very good reason. I can't explain it to you, but —"

"Now, Miss Armatt," interrupted John, with eager haste, "I understand what you mean, but you are not right. You don't know Miss Stull as I do. And even if things were as unequal between us as they look to be, — and upon my word, Miss Armatt, I tell you they are not, — it wouldn't make any difference to her. I've walked with her, and I've talked with her, and if you could have heard her, you would know what I know. And besides," he added, throwing into his voice a tone of strong entreaty, "I want to have this settled. I can't live this way any longer. Even if she didn't mean all she seemed to mean, and if she didn't care about what I said, I want to know it. Perhaps if she thinks I am too forward, I might be able to make her understand that there have been changes. Things are not exactly as they used to be. You see, Miss Armatt, all I ask is, just help me to see her; only let me talk to her."

"Mr. People," said Gay, looking at him very earnestly, and with a certain tenderness in her voice, "I really would not try to see Miss Stull. It will be much better for you to give it all up at once. I know that you can never be anything to her."

"You know!" cried John. "Do you really mean that?"

"I mean it," she said; "most earnestly and truly I mean it. You ask me to help you, and there is no way in the world in which I can help you so well as to keep you from going one step farther."

"Miss Armatt," said John, his voice a little broken, "do you know anything which gives you the right to say that?"

"Yes, I do," answered Gay, "and it would be wicked and cruel in me not to say so. I am very, very sorry for you, Mr. People, but it would be of no use at all for you to go to Matilda Stull, and you ought not to do it."

John stood looking upon the ground; then he raised his eyes. "No use at all?" he said.

"Not one bit," answered Gay. "I positively know it."

John's breast heaved, and he turned to one side. Then he held out his hand. "I am much obliged to you, Miss Armatt," he said. And he went away.

Gay stood and looked after him. Never again could that young man walk under blue skies and over green fields with the woman he loved. If he had ever done anything of the kind, all that was left to him now was to look back upon it.

And she, herself? She must look back too.

She walked on a few steps, and then she sat upon a stone. "It is too hard," she said to herself, "that this should be brought to me from both sides. It is too much!" And, putting her face into her hands, there burst from her the first tears she had shed since she became a woman.

XXV.

MR. ZENAS TURBY had not been very successful in his search for iron on the farm of Enoch Bullripple. He had found strong evidences of the existence of the ore on the lands of Mr. Stull, but the deposits did not seem to extend themselves in the direction of the Bullripple hills and fields. When Mr. Turby returned to his county town, after the Sunday on which Mr. Stratford had seen him making his investigations, he wrote Mr. Stull a report of the result of his searches, and it was very plain to him from the reply which he received that this report was not at all satisfactory to his employer.

Mr. Stull was a man of business as well as a man of feeling, and while he would have been very glad to see Enoch Bullripple ousted from his farm and to possess himself of the same, he did not care to go into this transaction solely from motives of revenge; he wished also to derive some direct advantage from it.

The question of the tenure of the lands was a very simple one. Mrs. People's husband and Enoch had each bought their farms from the heir of an old farmer who had been one of the earliest settlers of Cherry Bridge. The sale had been perfectly satisfactory to all parties, and Enoch had paid in full for his farm, but Mr. People had never been able to do this, and therefore it was that Mr. Stull, desiring a country place in a picturesque region for his growing family, had found it possible to buy up the mortgage against said farm, to oust the People family, and to possess himself of the property. During the last few years, however, it had become known that the old farmer before mentioned had had other heirs besides the one who sold the farms to Mr. People and Enoch Bullripple; but as these heirs lived in the West, and probably did not know that their relative had owned this mountain property, and if they did, were not likely to enter into litigation for their share of the comparatively small value of the farms, the sandy foundations of this real estate transaction were considered to be quite sound enough for ordinary intents and purposes.

Now, Mr. Stull looked upon the matter in this light: If his land and that of old Enoch

were rich in iron ore, he wished to possess himself of it all on a secure tenure, and would, therefore, gladly take measures to have the distant heirs come forward and prove their claims, and cause the property to be put upon the market, whereupon he would buy it, willingly sacrificing what he had paid before for the sake of the larger gain. But if this should prove to possess no mineral wealth, its agricultural value was not sufficient to make him desirous of buying it again, and he was perfectly willing to trust his good fortune and his lawyer to hold possession of it. Nor was the fact that Mr. Turby had found iron on his farm sufficient to induce Mr. Stull to take the measures he had meditated. If he could not have Enoch Bullripple's land, and perhaps some adjoining properties, so as to form a large tract which would be worth working, Mr. Stull did not care to go into the iron ore business. Therefore it was that Turby's report was not satisfactory to him.

Now, the energetic Zenas had hoped for himself a very fair profit from this piece of business, and he was loath, therefore, to see it dropped. Perceiving more plainly than he had perceived it before that he ought to find iron ore on the land of Enoch Bullripple, he determined to do it, if the thing were possible. He thereupon made another visit to Cherry Bridge; and as Enoch and his sister were sitting down to dinner on a pleasant summer day, they both saw the tax collector and amateur professor of applied geology busy at work near the top of a little hill not a half mile from their window.

"Confound that sneak of a Zenas Turby!" exclaimed Enoch, rising to his feet. "I've a mind to take my gun and blow off the top of his head! He knows I've told him not to come scratchin' here at my land. He thinks he's so far away we can't see him."

Mrs. People was not in a happy humor. It had not been very long since she had been told by her son John, just before he had left her for the city, that the brilliant hopes she built upon the basis of a Stull-People combination had come to naught, and must be allowed to vanish utterly. It was very hard for her to bear a blow like this, and her customary expression of outreaching good-nature had changed to one of mild ill-humor. The vision of herself as the central figure in her old homestead, or at least only declining to assume that position from the fact that Matilda Stull might prove a disagreeable daughter to live with, had been a very dear one to her. She had seen it by day and by night; while making pies, at the working of butter, and even during the intricate processes of the preserving of plums and the concoction of

currant-jelly. To give it up was like a spoonful of brine in a custard pudding.

The worst thing about Mrs. People's ill-humors, which were of very rare occurrence, was the fact that no one could tell in what direction they would vent themselves. Like a howitzer strapped to the back of a mule, they were as likely to be directed against friend as foe.

"Now, what in the name of common sense, Enoch," said she, "are you workin' yourself up into such tantrums for? If Zenas Turby finds iron on your land, how's that goin' to hurt you? What with the rains one year, and the drought the next, and the chicken-pip reg'lar every spring, there ain't much else you get off it. If he finds ore, it's yours and not his. So what's the use of jumpin' up that way and pullin' the table-cloth all crooked?"

Enoch sat down, but he kept his eye fixed on Zenas, who was now engaged in filling up a hole he had made in the ground. When this had been done, he gathered some large flat stones and made a little pile of them near the place where he had dug his hole. "Markin' the spot, eh?" said Enoch to himself, for he thought it not wise to make any further remarks on it to his sister. "What is he doin' that for?"

There now came into the shrewd old mind of Mr. Bullripple, as he watched the intruder disappear across the fields, a suspicion that those people out West, who it had been rumored ought to have had a voice in the giving of a title to this land, might have commissioned Zenas Turby to examine into the value of the property and find out whether or not it was worth fighting for. This supposition disturbed the mind of Enoch, for although he had declined to believe in the alleged claims of the far-away heirs, and had very strong faith in the virtue of possession when it related to land that had been bought and paid for, it was natural enough that he should be troubled by any actual evidence that an attack might be made upon the validity of his land deeds.

Even if Turby were merely searching for ore in the interests of some one who desired to open mines on his land, Enoch was dissatisfied. He had been told, years before, by a scientific friend of Mr. Stratford that there was no probability that his land contained iron, and he would have had no faith in the value of any propositions which might be made to him on the subject.

When he had finished his dinner, Enoch put on his hat and went out.

"Now, if you meet Mr. Turby," said Mrs. People, "don't you bother him. If he can find anythin' that's worth havin' on this place, I'm sure I'd like to see him do it! I always told

you, Enoch, that you took the poorest farm, and let Mr. People have the one that was ever so much better. Of course I was glad enough of that at the time, but if you'd been a little sharper, you'd got the best farm, and you and me would have been livin' on it now, and that Stull man would have had this dried-up place. Mr. People was very sharp."

Enoch said nothing about his having preferred a farm for which he felt he could pay, leaving to his brother-in-law the larger one for which it would be very difficult to pay, and went out over the fields. He walked straight to the spot where Turby had been digging, and stood and looked at it, and with a sharp-pointed stone he began to turn up the loose soil. When he had scratched out the most of it, he looked into the bottom of the hole.

"It may be," thought he, "that that rocky stuff has got some iron in it; and, at any rate, I'm dead sure that old Zenas is goin' to bring somebody here to look at it."

Mr. Bullripple, in a reflective mood, stood kicking the loose earth and stones back into the hole. Then he suddenly pulled his soft felt hat down over his right brow. A broad grin illumined his countenance, and with rapid steps he started for home. In about half an hour he returned, pushing before him a heavily loaded wheelbarrow. When he reached the little pile of stones, he took from the barrow a spade and a pickaxe, and began vigorously to deepen the hole which Mr. Turby had made, throwing most of the excavated soil into the wheelbarrow, which had been emptied of all its contents. When the hole was deep enough, he nearly filled it with said contents, and then, throwing in some soil, he smoothed up the place and made it look very much as it had done when Turby left it. Then Enoch took away his tools and his barrow, dumping the soil the latter contained into a hollow at some little distance, and returned to his house.

All that afternoon, no matter what else he might be doing, Mr. Bullripple kept an eye on the spot where he and Mr. Turby had been working. Nobody came to it, however, and the next morning he found himself obliged to go to the village. He left the spot in question in charge of his sister, telling her that if, during his absence, she saw anybody go there to dig, she must put on her bonnet and hurry over there to see what they got out of the ground. As Mrs. People always possessed a lively curiosity to know what people might get out of the ground, or out of anything else, she willingly accepted this charge.

When Mr. Bullripple arrived at the Cherry Bridge tavern, he found there Zenas Turby, who was ostensibly visiting the village for the purpose of collecting some debts.

"How d'ye do, Turby?" said Enoch. "Sull keepin' up your right, I see, to the name of Old Scratch!"

"What do you mean?" said the other.

"I mean," said Enoch, "that you're still gon' round, scratchin' up people's land to see what's under the grass. I do sometimes think that the ground-hogs must owe you somethin' and that you're tryin' to levy on 'em."

As usual, there were several village loungers in the room, and among these it was quite natural that Enoch's remark should raise a laugh.

"Humph!" growled Turby. "When I get anybody levied on either for **not payin' what he owes**, or else for holdin' what he don't own, it isn't gon' to be a ground-hog, mind, I tell you."

"Now, look here, Zenas," said Mr. Bullripple, seating himself astraddle of a chair with his arms over its back, "it does **make me laugh to see you come huntin' and grubbin' about my land to find iron ore when everybody knows there isn't any there.**"

"Confound your land!" said Turby. "What do I care about it?" And taking his big cane in his hand, he rose to depart.

"Care about it!" shouted Enoch in a tone which arrested the steps of the collector. "I should say you cared lots about it. Perhaps you will hardly believe me," he said, turning round to the company, "but it's as true as preachin' that I saw Zenas Turby yesterday diggin' away in one of my fields as if he was after a gold mine. Now, I believe it's nothin' but contrariness that makes him do that. I've told him, over and over again, that there ain't no ore there, and jus' to prove that I am wrong, he's tryin' to find it; but he's found himself to be the worst mistook man in this county, in spite of all he says he knows about mines and ores, and that sort of thing."

Mr. Turby's rugged face was turned severely upon Enoch. "Mistook, eh?" he growled. "That's all you know about it! I don't mind sayin' that I make it my business to know what sort of land there is in every part of this county, and I don't make no mistakes neither. And, to prove it, I say there is iron on Enoch Bullripple's place. I don't say there's enough of it to make the land worth anything, which everybody knows it isn't now; but it's there, for all that."

Enoch laughed derisively. "It is easy enough to say that," he cried, "but you couldn't show me a piece of ore on my land as big as a hickory nut. I dare you to do it."

Enoch's contemptuous tone was very irritating to Mr. Turby.

"Now, to show you and the rest of these people what sort of fool you are, Enoch Bullripple, I'll jus' take you over to your own farm

and let you see the ore that you haven't got sense enough to know is there till I come to pint it out to you. And anybody can come along that chooses."

"All right!" said Enoch. "If you want a chance to show you don't know anythin', I'm ready to give it to you." And he went out to his horse.

Mr. Turby's sulky was tied near by, and the tavern loungers did not mind a walk of a mile or so to find out which was the fool, Zenas Turby or Enoch Bullripple. Enoch called upon Pat, the stable-man, to come along and bring a spade and pickaxe, for he did not wish, he said, that Mr. Turby should fail in the search because his own little pick would not grub deep enough.

The party proceeded by the road for a considerable distance, and then they tied their horses to a fence and went over the fields until they came to the spot where Zenas had been digging.

"There's iron ore here," he said, "for I found it myself just about this spot."

"You have a great eye for spots," said Enoch, assuming to take no notice of the little pile of stones, "and you can dig here jus' as well as anywhere, for you won't find nothin'."

"We'll see about that," said Zenas. "You can begin there," turning to Pat and pointing to the place where the soil had been disturbed.

Pat made a blow with his pick, and scattered some loose dirt and stones; then again he brought down the heavy implement, and its point penetrated to some distance into the earth, where it appeared to fasten itself. The stout Pat gave a dexterous double-twist and jerked it out, and low upon its point there hung an old and somewhat rusty flat-iron.

Everybody started with surprise, and then there was a yell of laughter.

"Upon my word!" shouted Enoch, "my sile has got iron in it, after all! Go ahead, Pat!"

The laughing Irishman went ahead with right good will, and in a few moments he brought out of the hole a piece of old chain, two or three horseshoes, and several pieces of broken stove-pipe.

Everybody was in a roar of delight except Mr. Turby, who stood purple-red and furious. "I'll pay you for this, you, Bullripple!" he said, shaking his fist at his old enemy. And without another word, he marched away.

If his anger had not dulled his usually sharp wits, he might have stopped long enough to show that there really was iron in the soil. But the boisterous derision of the little party made him forget everything else.

"Good-bye, Zenas," shouted Enoch after him. "I'll give in that you are right and I am

wrong. Nobody can say now that there ain't no iron on my land, for you've come here yourself and p'inted it out."

And a fresh burst of laughter followed the retreating Turby.

Enoch now related with much glee how he had planned out and created this novel mineral deposit; how he had gone to the village in the hope that he could find Turby and stir him up to come and get himself caught in this trap. And then the jubilant little company departed, to tell to whomsoever they could find to listen this capital joke upon an old curmudgeon whom nobody liked.

"Ef iver he ses oirn ore agin," said the jovial Pat, "it's shure there'll be somebody to fetch him a bit of a sthove-poise, and axin him ef that's the sort he's afther."

The first person to whom Enoch had the chance to tell the tale was his sister, whom he met as he was leading his horse homeward across the fields. Mrs. People had seen the men on the hill, and, true to her promise and her curiosity, had hurried off to find out what they were going to dig up. Rapid progress was impossible for her, and she did not arrive in time; but Enoch's story so warmed her with delight that the clouds and fogs that had come up on account of the Matilda Stull disappointment melted and vanished away, and the disposition of Mrs. People again dwelt under its natural sunny sky.

Mr. Turby drove directly home to his county town, and on the way he turned over this matter in his mind. He had made a blunder in allowing to slip from him in his anger the admission that he had found iron ore on the Bullripple farm. But, after all, the case was not as bad as it might be. The result of the joke would be to cause those giggling fools to believe that there was no ore there, and that suited him exactly. But he would make Enoch Bullripple pay for his trick; and the first stroke in this present labor of hate would be to write to Mr. Stull and inform him that, having made renewed investigations on the Bullripple farm, he had found large deposits of iron.

"If that stirs him up," said Mr. Turby to himself, "to start out fresh ag'in after that land, he's the man to git it. And when he's got it, it'll be my turn to do the grinnin'!"

XXVI.

WHEN Horace Stratford returned from the sea-shore to his summer home on the Bullripple farm, his mind was in a state of uncertainty which was not usual to it. This was occasioned by doubts in regard to the proper conduct of his relations with Gay Armatt. Everything was

now very different from what it had been. In his former intercourse with her the two had been separated by a barrier which protected them both, and, while it separated them, actually gave them a sense of freedom in their social relations which they could not have felt had they not always been able to see that the engagement with Crisman stood between them. That barrier no longer existed, and Stratford could not but ask himself if Gay and he could continue to move in close parallel lines without a bar between them. Would not their lines be ever liable to meet? Would not the world wonder if they did not meet? Would not Gay herself wonder?

But he was not at all willing to create an effectual barrier of space by removing his line to a great and safe distance from that of Gay. He knew nothing of the new bonds into which Mr. Crisman had entered, and he had not that faith in the absolute sundering of his relations with Gay which he would have liked to have. If the two should come together,—the one a little lonely, still loyal as far as principle could go, and always apt to be tender-hearted, and the other repentant of his brutal folly, and with renewed desire to possess that treasure on which he had turned his back,—Stratford would be very fearful of the consequences. And if those consequences should be a reëngagement, the last condition of Gay would be far worse than the first, for she would take a man whom she knew to be unworthy of her, and this step would give his unworthiness peculiar advantages in their future life.

Looking at the matter in this light, it was plain enough that Gay should not be left to feel the want of that companionship to which she had been accustomed during this bright summer, and to miss that support and stimulation which Stratford had given her almost ever since he had known her, and which, in his opinion, had been productive of such good results. He could not forget that the devil finds some mischief still for idle minds as well as for idle hands, and he wished that Gay's mind should be worthily and industriously engaged with something which should not be Crisman.

If Stratford had been asked why he had not before considered the possibility of this dilemma, he would have answered that the present state of affairs came about much more suddenly than he had expected. He had believed that Gay would gradually be led to see her false position, and as the problems of the case formed themselves, the solutions would also appear. But now there was no time for the natural growth of solutions. They must be artificially constructed, and Stratford felt the task a very difficult one. If he could have been taken into the confidence of Miss Matilda

Stull, his mind would have been very much eased.

In this mental condition Stratford went to visit Mrs. Justin, and when he had been ten minutes in the company of Gay, all his doubts and uncertainties regarding his proper course of action were dissipated. This was in consequence, first, of the girl's demeanor, for she met him with the same frank and earnest friendliness which she had shown to him on the last day they had met. "She has not changed in regard to me," he said to himself, "and why should I change in regard to her?"

In the second place, Stratford was affected by the girl's appearance. There was something of sadness about her, and while he could not determine exactly how this sadness showed itself, he could see that it was there. She had lost none of her bloom, her freshness, or her beauty; but, apart from her friendliness and her delight in meeting him again, she was not exactly the same Gay.

"Poor child!" thought Stratford, "she has been touched more deeply than I supposed, and I must do what I can for her."

Therefore it was that the next morning the old readings were recommenced on the piazza; and therefore it was that on many days afterwards Stratford staid to dinner, and often to supper; and that the beautiful country freely yielded its pleasures, sometimes to the three of them, and sometimes to the two. Stratford was very anxious to see the full joyousness of Gay's nature assert itself. He thought it due to her character that there should disappear from her demeanor as soon as possible all vestige of regret for a step which her own good sense and high honor had impelled her to take. He knew nothing of that second blow, that revelation of the fact that not only had she no lover, but that she never had had a lover. To be affianced now to Matilda Stull, Crisman must always have been false to her. So thought Gay Armatt.

The full joyousness did not appear, but Gay entered with great earnestness and hearty good will into everything that Stratford proposed, whether it were study or pleasure. She had not known before how much restraint she had been used to put upon herself in her intercourse with this friend. She now knew that not only had there been a good deal of restraint, but that it had all disappeared. As the days passed on, she became Stratford's disciple. No one ever more thoroughly believed in a master than she believed in him.

With the exceedingly friendly intimacy which resulted from all this, Mrs. Justin did not interfere. She had thought Stratford's course wrong in the beginning, and she thought it wrong now. She did not believe

it was right in a man who had just broken off a match to step forward so promptly to turn the rupture to his own advantage. And yet she could not deny to herself that no greater good could have happened to Gay than her delivery from Crisman. And neither could she believe that any possible good could now come to the girl which would be greater than a marriage with Stratford. She had opposed that which she believed to be evil which was being done that good might come of it, and the good had come in spite of her opposition. She now considered that she had done enough. She would oppose no more.

It was on a warm morning, well forward in August, that Stratford was very much surprised by a visit from Arthur Thorne. It was such an unusual, in fact such an unheard-of thing for Thorne to make a visit without either being invited or announcing his intention, that Stratford did not attempt to conceal his astonishment when he met his friend.

"I thought you would be somewhat amazed," said Mr. Thorne, as he took a seat on the Bullripple porch and fanned himself with his straw hat, "but I didn't suppose your emotion would really injure your constitution, and as I wanted to come, I came. I'll tell you all about it as soon as I get a little cooled off."

In a few minutes Mr. Thorne became more comfortable, and then he settled himself back in the big wooden arm-chair, and asked his friend for a pipe.

"A pipe!" exclaimed Stratford. "You don't mean to say you smoke!"

"Yes, I do," said Thorne. "Why shouldn't I smoke? In fact, I like to smoke. The family don't object to it out here, do they?"

"Of course nobody objects to it," said the other, "but I must admit that I am surprised to find that you want to smoke, and especially a pipe."

Stratford brought the pipe and one for himself, and the two friends composed themselves for a chat.

"I can talk so much better when I am smoking," said Arthur.

"That is a new thing, isn't it?" remarked Stratford.

"Rather newish," said his friend. "And indeed there seems to be a tendency towards newishness with me. Now, I am well aware that it isn't proper for me to come here without knowing whether you want me or not, or even writing to let you know I intended to do it. But I just took it into my head to come, and here I am. If it is not entirely convenient for you to have me, I can go to the tavern in the village. I dare say it is a very good tavern."

"Convenient!" said Stratford. "Of course it is entirely convenient. Here is the room which you had before, all ready for you."

"That is very good of you," said Thorne, "and I don't mind in the least telling you why I came down here, or up, whichever it is. It is all on account of Miss Armatt. I never had anything take possession of me as that girl has! I have tried to be proper about it, but it's of no use. In fact, I am tired of being proper. It doesn't pay. Sometimes it makes me sick to see everything straight and proper about me, for I am just the other way myself. I have worked hard at one thing, and I have worked hard at another; that doesn't help me at all; I am thinking of her all the time.—Then I sat down, and said to myself: 'This trying to do the right thing is all stuff and nonsense. There is Stratford; he doesn't trouble himself about anything of the sort, and he is happy. If he likes a girl, he makes himself agreeable to her, he spends his time with her, and he carries out his theories. It doesn't make any difference to him that she is engaged to be married to some one else; now, why should it make a difference to

me? I cannot expect to make myself agreeable to her, nor to spend my time with her, and I have no theories to carry out, but I can go there and look at her again.' And that I determined to do. Now, I know very well that even this is not right; that it is unjust to myself, and unjust to the man who is engaged to Miss Armatt. But, as I said before, I am tired of doing right. That sort of thing doesn't help me any. It simply gives me the worst of everything and puts me in the background; and I have made up my mind to drop it. Of course this is all very astonishing to you, Stratford, but I determined to be quite frank and open with you, and let you see everything just as it stands."

Stratford drew a long breath. "I wish to be perfectly frank and open with *you*," he said, "and therefore deem it my duty to tell you that Miss Armatt is not under promise to marry any one. Her engagement with Mr. Crisman has been broken off."

"Good Heavens!" exclaimed Thorne, springing up so suddenly that his chair fell backward on the porch.

(To be continued.)

Frank R. Stockton.

ANIMAL LOCOMOTION IN THE MUYBRIDGE PHOTOGRAPHS.

It is now nine years since the photographs of Eadweard Muybridge, taken in California, surprised the world by challenging all received conceptions of animal motion. Their subsequent publication in "The Horse in Motion," in 1882, constitutes the most considerable record on the subject hitherto accessible. In the interval since their appearance, it has become clear that what was at first presented as altering the portrayal of living movement was in reality an important addition to the instruments of scientific research, by extending observation along a path where the limits of human sense had barred advance. For the past four years the University of Pennsylvania, chiefly through the efforts of Dr. William Pepper, its Provost, has furnished Mr. Muybridge the apparatus and the scientific supervision requisite to widen the record and extend the research of instantaneous photography into the method and mechanism of animal motion. Whether animals should be drawn as they appear in the camera is still *sub judice*; but there is no question whatever that in no other way can they be seen for the study of their locomotion.

We see with a camera whose drop-shutter winks in a thirtieth of a second, but on whose plate impressions last for from a sixteenth to an eighth of a second, so that moving objects for any space they cover in this time appear either as blurred, like the shimmer of a turning wheel, or continuous, like the circle left by a whirling and lighted stick. To read this record takes the brain an appreciable fraction of time—at least one five-hundredth of a second. If the four feet of a quadruped are in consideration, there is the absolute dead-wall that when a leg moves there are five points to think about together and the mind can only carry four objects at once in consciousness—as more than one confused observer has found in trying to catch and carry the sequence of footfalls in the slowest walk of horse or cow. These limits of brain and eye, not in what is unseen but in what is seen, are less easy to appreciate and accept as fundamental than those with which we are more familiar. That we cannot see under a certain size or beyond a certain distance, that the retina makes no accounting of the photographic dark beyond the violet and knows naught of the heat dark this side the red, that in the world of unheard sound about us some notes we cannot hear because they are too high and some because

MULE BUCKING AND KICKING.

CHILD WALKING AND CRAWLING UPSTAIRS.

they are too low, that we live in a world of odors of which to our grave loss we smell a bare hundredth part of what a healthy dog smells,—these limitations we daily act upon, and the use of all instruments of precision rests upon them. The use of instantaneous photography in reading the secret of motion was as much the introduction of a new instrument of precision to supply the lack of sense as the use of the microscope, and had the same limitations in its application. More was claimed than was meet, and less admitted than was true, of the revelations of Mr. Muybridge. Art is one long convention which accepts the ordinary impressions of sense in interpreting nature. “Flowers, like everything else that is lovely in the visible world,” says Mr. John Ruskin, “are only to be seen rightly with the eyes which the God who made them gave us, and neither with microscopes nor spectacles.” The artist responds to science, not in her discoveries, but in their influence in changing the general and average perception of nature. Landscape art has not been altered by geological discoveries, but their collective influence has created an atmosphere in which an artist breathes uneasily if he has put slate débris at the foot of a basalt cliff.

The real discovery which Mr. Muybridge made was, therefore, the addition of a new method of research, which put before the eye what it could not see unaided.

To obtain the results of this new method through a complete and consecutive series of observations, carried on with a definite purpose under a scientific direction as proposed by the University of Pennsylvania, required in an abundant measure both time and money. The late Mr. J. B. Lippincott, of Philadelphia, whose interest in the lower animals had shown itself by his repeated gifts to the veterinary department of the university, was much interested in the investigation, and liberally advanced the preliminary expenses. Additional advances were made by a committee of five guarantors, under the stipulation that the scientific

conduct of the work should rest in the hands of the university through a commission appointed from its faculties to supervise the work.

When the work, begun four years ago, was completed, \$30,000 had been expended, and 100,000 plates exposed; and the final results, as reproduced by a photo-gelatine process, extend, in the completed work, through 781 folio sheets, presenting over 20,000 positions assumed by men, women, and children, draped and nude, and by birds and animals in motion. Human action is extended through all the round of work and play, for both sexes and all ages; the Zoölogical Garden was drawn upon for animals, the university hospital for instances of disease, and the entire field of athletic action was covered by university students, some of them “record-breakers.” The photographs of moving animals taken in this work nearly equal all others, while those taken by Mr. Muybridge covering a series of motions automatically timed are many fold the successive exposures ever made elsewhere.

The merest beginner can spring a drop-shutter so as to obtain a single exposure of a moving object. To secure a series of such pictures accurately divided in time and evenly distributed in space is a different matter, and can be achieved only by successively exposing different plates or exposing successive portions of the same plate. The latter has been the favorite method of Monsieur E. J. Marey, the French investigator in this field, who whirls a perforated disk over an instantaneous plate before which the object is moving. This is the principle of the zoëtrope, but with the plate where the eye is in the toy and with the slit whirling, instead of the painted ring of figures. When a man turns a somersault before this apparatus, the developed plate shows him flinging himself in successive positions across it, as each successive slit in the perforated disk lets in a new image as it passes. A “battery” of cameras in a row, tripped in suc-

cession as the object moves before them, has been the method usually employed in this country. In the familiar illustrations taken in California, each camera was exposed by a thread which the moving horse broke as he went across the field. In the present researches, an electric circuit worked by a chronometric apparatus opened and closed each shutter. The studio through which this great defile of life studies passed was a fenced space open to the sky. A screen, before which the object moved, reticulated in small squares of 2 inches and large ones of 19, 15 and 50 centimeters), whose net-work appears on the background of some illustrations, faced a "battery" of from 12 to 24 cameras. At right angles stood another row, arranged perpendicularly, and for many movements a third set was employed. Each act was therefore raked fore and aft as well as registered in passage, and was often covered from top to bottom besides. Sloping white screens "threw up" the under lights. Beyond all, there was above neither roof, glass, nor sky-light, nothing but the clear and open sky. For photography which has to do with the human figure, so rarely exposed to the frank, kindly, and searching light of the heavens, this is a difference, not of degree, but of kind. There is no mirror, no reflector for diffusing a perfect light like the perfect arch of the sky. To one familiar with work from the model, and knowing the chill and steady north light of the studio and the life-class, dead to changes, there was full suggestion in this long succession of studies and poses in the complete light of day, complex, intricate, but full of teaching in form, in motion, in texture, and in color. It will be a broad service to art if the study of these photographs suggests to some one the possibility of putting under the searching sky work from the life. It would change its *motif*, as landscape art has been transfigured by a like translation to the haven and heaven of nature.

Minute photographs were taken by the cameras in action, and were enlarged from the small representations of beast or bird to the illustrations used in this article, which picture but portions of the original plates. Full light, careful manipulation, and perfect lenses enabled these enlargements to be made without distortion, replacing the silhouettes which are the usual and familiar result of instantaneous work by prints distinct, defined, and determinate. A new device, opened and closed by the automatic action of an electric circuit, reduced the exposures to a point apparently much below any previous record. Careful calculation tends to show that the exposures of a number of plates must have been less than $\frac{1}{2000}$ of a second, and not impossibly as low as $\frac{1}{3000}$. In

practical work, however, $\frac{1}{800}$ to $\frac{1}{1000}$ of a second proved fully short enough to catch the phase of a stride of a horse, and $\frac{1}{200}$ of a second was used for most of the slower movements. No clock can measure these brief intervals, but a tuning-fork, keyed to one hundred vibrations in the second, left its tell-tale dots on a moving cylinder where the opening circuit which tripped the cameras made their marks. It is possible that elements of error as to time exist in such a method absent from M. Marey's, but they are counterbalanced for popular exposition by better pictorial results.

The great body of records secured by these methods makes no such special revelation as Mr. Muybridge's earlier photographs. The attitudes which amazed the world then were accepted by most, as they were by Mr. George E. Waring in an article in *THE CENTURY* for July, 1882,* as settling the manner, method, and mechanism of progression by the horse and dog.

But, now that a broader record is presented, there is tolerably certain to be something of a reaction to the more familiar views of movement. The wet-plates of a decade ago gave simple outlines and not rounded pictures. Greater skill and care in manipulation, and more numerous examples, make it clear to any one who examines the photographs presented here, that the impression of automatism left by the earlier illustrations disappears in these later views of motion. The character of the stride, certain simple facts in the sequence of footfalls, and the alternation of support were reasonably well conveyed; but less apparent manifestations, which convey both the character of the individual animal and the characteristics of each motion, disappeared in the dense shadows of the earlier silhouettes. If, as Mr. Waring said of them five years ago, "the testimony of the zoëtrope, and, later, of the zoöpraxiscope, has silenced all skepticism, and one can no longer hesitate to concede the truth and simplicity of what at first seemed complicated and absurd," still, I take it that no one who had ridden a horse or loved a dog but felt a certain outraged sensibility in being assured that creatures whose footfalls, the slip and swell of whose shoulders, and the gathering arch and spring of whose back had an individuality all their own, as distinct as the pressure of a friend's hand or the tone of his voice, were four-legged machines chiefly occupied in balancing on one toe, straining a pastern to breaking, or gathering their legs in a disorderly bundle on their stomachs. These photographs, taken under more favorable conditions, give each of the remarkable positions

* "The Horse in Motion," by George E. Waring, Jr. *CENTURY*, Vol. 24, p. 381.

which repetition has made familiar and to which even repetition can scarcely reconcile us; but they are given with subtle variations, with change and alteration, with departures from the automatic sequence first suggested, which show how individual is the movement, not merely of each species, but of each animal.

The University Commission intrusted to Dr. Harrison Allen, emeritus professor of physiology in the university and a comparative anatomist of high rank, the work of studying

the "Horse in Motion," led its author to assert that in the work of propulsion and support the fore limb "does more than its share of both offices." Dr. Allen offers a different theory. These rounded photographs of the play and action of muscle suggest that the history of animal movement is the development of the rear limbs for use as a spring and source of energy and of the fore limbs as a basis of support. For the race-horses, the fore limbs are vaulting poles. To them, when the hind-quarters have given

RUNNING STRAIGHT HIGH JUMP.

the entire series, with the view of eliciting and illustrating the laws of animal motion and muscular action shown by it. Dr. Allen has published his conclusions as a preface to the memoir on the series, in which will also appear the results reached by other investigators. These conclusions somewhat redeem the unaided human eye from failure to catch the principle of animal locomotion. The apparent spring from the fore foot, which was the most conspicuous revelation of the photographs of

their powerful impulse, he passes; on them he balances; and from them he moves on to the next gathering launch of his haunches. Through generations of adaptation, the slender, "clean" fore leg has become a straight but springy column of support. The great muscular system of the shoulder is, in Dr. Allen's view, little able to give the leg impulse, and is arranged for support about the firm shoulder-bones which hug the spine—the horse has no collar-bone to smash like a bow bent beyond its limits, as his

BACK SOMERSAULT.

rider's does when both go headlong in an ugly cropper. These muscles catch and diffuse the shock with which a horse in his forward stride lands on his fore legs. Each joint, which rolls so simply with smooth surfaces in animals less highly organized for speed, has become in the horse tongued and grooved at elbow, wrist, and knuckle,—to apply to "shoulder," "knee," and "pastern" joints their human analogues,—the fore hoof has widened to a larger support than the hind, largest of all in draught-horses, where the fore feet are the fulcrum on which the push of the hind-quarters turns, until the straight elastic column is equal to its task, breaking, if at all, at the springy joint whose flex carries off the shock of impact even in the rushing descent in the figure on page 367.

The breathless instant which every child knows on a rocking-horse, and which any one of vivid memory for childhood will recall, when doubt comes whether this time rocker and rider are not going to pitch forward on their noses, and the settling back in safety on the hind rockers, illustrate very fairly the swing by which a horse passes from stride to stride—with the advantage in the horse that he swings his hind rockers forward as his body launches on past the perpendicular support of

the fore leg, until this too has passed from under the center of gravity and the hind legs are ready in place to offer support for the next stride. For this impulse, the hind-quarter rivets into the back-bone, whose lumbar vertebræ can double like a curving spring under the pull of the great system of muscles whose sheathing swell is so plainly apparent in the figure on page 367 as the horse flings his weight over the hurdle. How far this spring of the loins can go stands graphically forth in the figure on page 367. The buck, first with one foot and then with both, the return to the ground, and the vicious lash behind, fall well short of half a second; but there is time in this to show at once how rigid and how flexible is this mechanism. Or, as Dr. Allen says, with a scientific elegance and accuracy no layman can hope to equal in touching at a safe remove upon this frequent object of the paragrapher's pen, "The excursus of the hind legs is dependent upon the flexibility of the lumbar vertebræ."

So, too, as an elastic bow suddenly and strongly bent has a tendency to spring to one side and another, the horse's rear limbs, taken as a whole, tend to spring out; and it is this spread outward of the stifle or upper joint

PIGEON, FLYING.

AMERICAN EAGLE, FLYING.

and bend inward of the back or "knee" which gives the "style action" whose presence is accepted as the sign of speed present or to be transmitted. In a dog moving at full speed, the back, in furnishing these impulses, doubles like a bent bow, giving those curious foreshortened curves which at swift intervals turn a coursing hound in all appearance to a rolling ball as one rides hard behind; and in more than one instance these photographs show that the impulse of the hind legs is strong enough to keep the fore legs busy through two or three steps as the dog goes balancing forward, shot on by the curving spring of back-bone, haunch, and hind leg.

Such a view of animal movement has its support, Dr. Allen urges, to summarize his views, in the circumstance that the earliest progression was by the hind legs alone, still apparent in the kangaroo, and yet more

striking in the earliest animals. If the path by which vertebral movement has developed be followed, a regular sequence appears, beginning with lizards like the salamander, whose legs are spread straight out on each side and move independently. By degrees and by pairs, first back and then fore, the legs of quadrupeds turn downwards until they have gone through all the successive angles, and reach in man the possibility of fore and aft extension. Just as a series of angles can be drawn beginning with the reptile prone and moving up by a growing angle until man stands at a right angle with the ground, so the legs spread flat in lizards of an early type slowly crook down until they are bent under the crocodile, extend straight down, bent a quarter circle around, below higher quadrupeds, and can at last be placed in a direct line with the trunk in man. *Per*

THROWING A TWENTY-POUND ROCK.

contra, the bird, which is a slip backwards, a "no thoroughfare" in the ascending series of creation, bends its wings upward to the reverse angle of the quadruped. All the progress of specialized motion, as it grows from the simplicity of the hop, through the leap, the canter, the run, the trot, an artificial gait, and reaches in the walk the most intricate of all natural motions, preserves lift and impulse

in the figure on page 366, such a swing of the rider as suggests that the fore leg as it left the ground has given an impulse of its own. May it not be that while the hind-quarters in a sense overcome inertia, and start the stride, the muscular office of the fore-quarters is to preserve it?

But apart from scientific results whose full measure can be known only after the careful

BASEBALL-THROWING.

from hind-quarters and the spring-balance and moving support of fore.

This theory of animal motion being a reaction from the first position assumed on the subject, it is not impossible that the ultimate decision will rest somewhere between. Without assuming to pass upon an issue whose decision requires special training, I question whether any one who has felt, under the edges of his saddle-leathers, the powerful action of a horse's fore-quarters at high speed will be ready to admit that these surging muscles merely stiffen and hold in place the bending fore leg. An observant eye will catch also,

study by many investigators of these plates, they have an interest of their own in the light they give the ordinary observer, and still more the artist, upon the usual facts of nature. Flight is a daily puzzle, and the instantaneous photographs of the pigeon and the American eagle (pp. 362, 363) tell more of the secrets of flight than any group of illustrations accessible outside of a special paper or two in "transactions." The "sharp stroke and long recover" which has revolutionized college boating because it used speed and a sharp "catch" where force was exerted, and wasted none of the energy of action in hasty preparation, is apparent

BASEBALL-BATTING.

in the oarage through the air of each of these birds. In every flying-machine, the "recover" is all the battle. The lifting stroke is easily dealt, but to get the wing back has overtaxed the invention of two centuries devoted to the problem. In the bird, through all the period in which the pinion is brought forward for recovery,—and this occupies three-fifths of the time employed in the acts,—the wing slides along tail-end down, front edge raised, and the bird passes up kite-fashion on the impulse which the stroke has given. The real recover only begins when the head has been almost hidden by the arched and hooding wing, and then—every feather whirled about like the slats of a Venetian blind by a single pull of the muscle lying at the quill-pits—the wing is thrown over the head by a single twist of wrist and elbow: feathers are only finger-nails, ready for the next stroke. Up to this point the bird has been rising. Here for an instant it drops, to begin rising again with the next stroke, giving the wavy line of progression, apparent in the series, but lost to the eye in the straight path a pigeon usually seems to follow.

The flight in these photographs is nowhere swift. As it is, moving slowly, the downward rush of the pigeon's wing, catching the air in a curving line like a propeller flange, has outstripped the speed of an instantaneous plate. The bird in this flight is moving through the

twelve views only a yard or so (one meter) in $\frac{2\frac{3}{4}}{1000}$ of a second,—about thirteen feet a second, or a mile in a little over seven minutes. A pigeon under favorable circumstances is equal not to ten but to sixty and eighty miles an hour. The constant habit in drawing a wing is to present it as a plane of simple form and curve, which a wing never is, and to overlook the separate action of the long quill-feathers. The Japanese do neither. The rudest sketch of bird-flight made in Japan by an artisan rather than an artist, which can be picked up for a few cents, gives the wing its double screw curve and opens the moving feathers, which, at every stroke, turn backwards and forwards. To find an eagle whose ragged and opening feathers give the impression of life and action apparent in the figure on page 363, we must turn back to the vigorous eagle whose spreading wings fill the space on the coins of an early Ptolemy. Ragged, unkempt, and weak as the great bird was from long confinement when he winged his brief flight across this field with neither "the pride nor ample pinion that the Theban eagle bears," there is still about the stretch and sweep of these great vans, their easy curve and sharp recover, such suggestion of free flight as it would be hard to match in any drawing, familiar though the subject be and tried of scores of pencils.

The lesson of this extended series illustrating animal motion is in the lower animals one

JUMPING A HURDLE-BARE-BACK.

of mechanism rather than form; in man it is one rather of form than of mechanism. There is no one of the plates given in this article, for instance, if the figure on page 360 be excepted, in which a new attitude is presented. There, the sharp ingathering of all four limbs, in a manner which suggests the cramped legs of a racer between strides, varies widely from the conventional type of a running jump, which represents the jumper as shooting over the bar, bent, but with arms and legs straight. The others, vigorous as they are in their speaking attitudes, give no new positions; but they emphasize the difficulty of exactly catching and fixing, without the memoranda offered by photographs like these, the successive changes of pose and muscle which the simplest physical act brings about or the new posture in which it leaves the body. The series on page 364 cover in time a half second from first to last, and the alterations in posture, which modify so wholly the profile of the figure, are separated from each other by a tenth of a second each. The trained eye misses much of the rapid swell and subsidence of muscle and flex of trunk in these brief intervals; the un-

trained eye misses both altogether. All are recorded in this accurate portraiture. The complete transformation of figure which takes place in batting, from Figs. 1 to 8 on page 365, is worked in three-quarters of a second. When we speak of nervous energy transmitted at a speed of 90 feet (30 meters) a second or a muscle contracting in from $\frac{8}{100}$ to $\frac{9}{100}$ of a second, the statement furnishes a shallow conception of the rapidity with which the trained and coördinated muscles of the human trunk and arms go through the myriad changes which are needed in some act which familiarity has brought to the edge of automatism. Yet in these swiftly changing relations are hidden the secret and revelation of living action as it is. It were bald error, open to ridicule, to suggest that the notation of the photograph can compare with the study of these changes in the living figure; but the data furnished by these series of photographs give ma-

terial for the study of the altering positions of action akin to, and, within just limit and in its proper place and station, comparable with the familiar knowledge obtained by the study of artistic anatomy carried on in the only method in which its lessons can be adequately acquired.

It is well to be mindful of the value of the records here presented and provided on a still larger scale by these researches of the University of Pennsylvania, because a sense of surface and of the precise forces at work beneath it is one of the broad marks of difference which separate modern sculpture, if a few examples be excepted, from ancient. The eye grows accustomed to what it sees fully, frequently, and in freedom. Its capacity for appreciation—turning aside from the point of view involved in production to a more general and generous attitude towards art—grows by what it feeds upon. Limited as is the teaching and narrow the lesson given by these sharply defined shadows of action caught and crystallized by the camera, they are still broad enough to suggest, I venture to say, a somewhat new measure and method of criticism for much hitherto overlooked and little understood by recep-

give but untrained laymen; and art, if it is to succeed at all, must be built up on a broad foundation of lay appreciation. Its plant withers or grows to distorted shapes, if it is forced this soil in deep and well-cultivated measure. The resemblance between the last figure on page 363 and the familiar Mercury of John of Bologna is a trite matter, interesting but not important of itself. But I question greatly if, in this most suggestive series, any one will follow from the start in putting the stone the changes which finally launch the twenty-pound weight, without a new sense, not merely of the light, airy, and splendid figure so long adored, which the sculptor of the Renaissance poised on the breath of the west wind, but of the truth and vigor with which that masterpiece suggests and expresses swift, continuous, and powerful motion. In that appreciative anxiety to admire the right thing at all pain and hazard to past predilection which is at once the cause, characteristic, and, in due season, let one hope, promise, of the present average American attitude towards most art, the training of perception in such matters as these is indispensable to progress in public taste.

Suggestions of this order, although nowhere else linked to so remarkable and typical an example, run through the instances of more swift and violent and therefore less familiar action in the photographs of the running, straight high jump (page 360), and of the back somersault (page 361). In the jump, as in putting the heavy weight, the models in each case were university students whose success in contests was the best test of their fit proficiency, a circumstance of which the reader can scarcely fail to be sensible, even before he is informed of the fact. The running high jump, involving a high lift rather than a far throw of the body, is less rapid than most violent exertions. From first to last one second elapses for all the illustrations. With this time the subject is often enough attempted by clever English draughtsmen; but even here where the camera has least relatively to tell, there is fresh suggestion in the fashion, already touched upon, in

which the gathering of the legs and arms follows the same act in the mid-stride of four-footed animals; and the straight line in which the body shoots towards the ground, tense as a crucifix, gives sense of movement not easily surpassed. But if the jump is slow, the somersault is not. The span of time, from the instant the ground is left until the feet touch the ground again, is less than half a second; and in this space the body has been whirled around in air through the

JUMPING A HURDLE — SADDLE.

moving arc of a ball shot forward, twisting as it goes.

The advance of instantaneous photography in recent years, not less than the excellence of the method employed in this inquiry, has its best measure in the figures of a gray mare taking a hurdle in a single easy flight, smooth and straight as a swallow's (page 366). The impulse for this leap has already been given before this series opens. Its character, the swelling strain of the hind-quarters, is better caught in another leap (page 367). The seven exposures which carry the mare from the time

CANTER — BARE-BACK.

her hind feet leave the ground until her fore legs catch it again cover a bare third of a second ($\frac{60}{1000}$ to each interval). The twenty-one feet of the leap from hind hoof to hind hoof are passed in half a second. So far as mere position and outline go, this is an old story, but the modeling, the balance, and the action are all new, and all dependent for interest on evanescent phases only apparent to the camera's supersensitive plate. The rigid swell of the powerful muscles which sheathe the thigh and give the lift to both leaps lasts, at longest, less than one-tenth of a second, and yet on the proper portrayal of this rests the vraisemblance of the flight, the ocular persuasion of a force exerted equal to its successful doing (page 367). M. Taine has somewhere said that human progression lost the possibility of grace when the yielding arch of the foot was shod with the stiff-soled and heeled boot of modern life. Something akin to this will occur at the contrast between the flexile changing grace of the leap bare-back and the same spring in a saddle. The rigid pad of leather and wood, light as it may be, is a bar to free and common action by horse and rider. The full meaning of this shines in each figuring of the horse and his nude bare-back rider on this page. The slender youthful rider and his

horse give us again the Greek seat of the frieze of the Parthenon, with its drooping hand and swaying motion, its simplicity of outline, of treatment, and of poise. Nor can I better emphasize and express the value and worth of these photographs of living motion in directing criticism and stimulating appreciation, than by saying that so well trained an observer and conscientious a critic as the late Mr. Charles C. Perkins, in his "Historical Hand-book of Italian Sculpture," did not hesitate to say of Donatello's equestrian statue, at Padua, of Eramos di Narni, that "it shows the closest study of nature in all but one particular; namely, that the horse moves by lifting his two right legs simultaneously from the ground." "This error, common to other sculptors, both ancient and modern," as Mr. Perkins writes, is the position caught above; and it is the position selected by keener and better-trained eyes than Mr. Perkins's,—the position of Verocchio's colossal bronze of Colleoni at Venice; of more than one of the figures in the Panathenaic procession; of the statue of Balbus found at Pompeii; and of that matchless semblance of a matchless man, the equestrian statue of Marcus Aurelius.

Talcott Williams.

THE LINCOLN-DOUGLAS DEBATES.

ABRAHAM LINCOLN: A HISTORY.*

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

BUILDING IN WHICH THE LECOMPTON CONSTITUTION WAS DRAWN.

THE LECOMPTON CONSTITUTION.

THE year 1857 brings us to a decided change in the affairs of Kansas, but to no less remarkable occurrences. Active civil war gradually ceased in the preceding autumn,—a result due to the vigorous and impartial administration of Governor Geary and the arrival of the inclement winter weather.

On the evening of the day the legislature met (January 12th, 1857), the pro-slavery party held a large political convention, in which it was confessed that they were in a hopeless minority in the territory, and the general conclusion was reached that it was no longer worth while to attempt to form a slave State in Kansas.† Many of its hitherto active leaders immediately and definitely abandoned the struggle. But the Missouri cabal, intrenched in the various territorial and county offices, held to their design, though their labors now assumed a somewhat different character. They denounced Governor Geary in their reso-

lutions, and devised legislation to further their intrigues.‡ By the middle of February, under their inspiration, a bill providing for a convention to frame a State constitution was perfected and enacted. The governor immediately sent the legislature his message, reminding them that the leading idea of the organic act was to leave the actual *bonâ fide* inhabitants of the territory “perfectly free to form and regulate their domestic institutions in their own way,” and vetoing the bill because “the legislature has failed to make any provision to submit the constitution when

framed to the consideration of the people for their ratification or rejection.”§ The governor’s argument was wasted on the predetermined legislators. They promptly passed the act over his veto.

The cabal was in no mood to be thwarted, and under a show of outward toleration, if not respect, their deep hostility found such means of making itself felt that the governor began to receive insult from street ruffians, and to become apprehensive for his personal safety. In such a contest he was single-handed against the whole pro-slavery town of Lecompton. The foundation of his authority was gradually sapped; and finding himself no longer sustained at Washington, where the private appeals and denunciations of the cabal were more influential than his official reports, he wrote his resignation on the day of Buchanan’s inauguration, and a week later left the territory in secrecy as a fugitive. Thus, in less than three years, three successive Democratic executives had been resisted, disgraced, and overthrown by the political conspiracy which ruled the territory; and Kansas had indeed become, in the phraseology of the day, “the graveyard of governors.”

The Kansas imbroglio was a political scandal of such large proportions, and so clearly threatened a dangerous schism in the Demo-

JAMES BUCHANAN, PRESIDENT, 1857-61. (FROM A PHOTOGRAPH BY BRADY.)

cratic party, that the new President, Buchanan, and his new Cabinet, proceeded to its treatment with the utmost caution. The subject was fraught with difficulties not of easy solution. The South, to retain her political supremacy, or even her equality, needed more slave States to furnish additional votes in the United States Senate. To make a slave State of Kansas, the Missouri Compromise had been repealed, and a bogus legislature elected and supported by

the successive Missouri invasions and the guerrilla war of 1856. All these devices had, however, confessedly failed of their object. Northern emigration and antislavery sentiment were clearly in possession of Kansas, and a majority of voters stood ready upon fair occasion to place her in the column of free States. It had become a game on the chess-board of national politics. The moving pieces stood in Missouri and Kansas, but the

players sat in Washington. In reality it was a double game. There was plot and under-plot. Beneath the struggle between free States and slave States were the intrigue and deception carried on between Northern Dem-

crats and Southern Democrats. In reality it was a double game. There was plot and under-plot. Beneath the struggle between free States and slave States were the intrigue and deception carried on between Northern Dem-

GOVERNOR ROBERT J. WALKER.

ocrats and Southern Democrats. The Kansas-Nebraska act was a double-tongued statute, and the Cincinnati platform a Janus-faced banner. Momentary victory was with the Southern Democrats, for they had secured the nomination and election of President Buchanan, a "Northern man with Southern principles."

Determined to secure whatever prestige could be derived from high qualification and party influence, Buchanan tendered the vacant governorship of Kansas to his intimate personal and political friend, Robert J. Walker, of Mississippi, a man of great ability and na-

Harney should be "put in special command in Kansas with a large body of troops, and especially of dragoons and a battery,"* and retained there subject to his military directions until the danger was over; and second, that he "should advocate the submission of the constitution to the vote of the people for ratification or rejection."†

This latter had now become a vital point in the political game. The recent action of the territorial legislature and Geary's already

* Walker to Cass, July 15th, 1857. Senate Docs., 1st Sess., 35th Cong., Vol. I., Ex. Doc. 8, p. 32.

† Walker to Cass, Dec. 15th, 1857. *Ibid.*, p. 122.

mentioned veto message were before the President and his Cabinet.* But much more important than this move of the Kansas pieces was the prior determination of prominent Washington players. During the Kansas civil war and the Presidential campaign of the previous year, by way of offset to the Topeka constitution, both Senator Douglas† and Senator Toombs‡ wrote and introduced in the Senate bills to enable Kansas to form a State constitution. The first by design, and the second by accident, contained a clause to submit such constitution, when formed, to a vote of the people. Both these bills were considered not only by the Senate Committee on Territories, of which Douglas was chairman, but also by a caucus of Democratic senators. Said Senator Bigler:

"It was held, by those most intelligent on the subject, that in view of all the difficulties surrounding that Territory, [and] the danger of any experiment at that time of a popular vote, it would be better that there should be no such provision in the Toombs bill; and it was my understanding, in all the intercourse I had, that that convention would make a constitution and send it here without submitting it to the popular vote."§

This Toombs bill was, after modification in other respects, adopted by Douglas, and duly passed by the Senate; but the House with an opposition majority refused its assent. All these preliminaries were well known to the Buchanan Cabinet, and of course also to Douglas. It is fair to assume that under such circumstances Walker's emphatic stipulation was deliberately and thoroughly discussed. Indeed, extraordinary urging had been necessary to induce him to reconsider his early refusals. Douglas personally joined in the solicitation. || Because of the determined opposition of his own family, Walker had promised his wife that he would not go to Kansas without her consent; and President Buchanan was so anxious on the point that he personally called on Mrs. Walker and persuaded her to waive her objections. ¶ Under influences like these Walker finally accepted the appointment, and the President and Cabinet accepted his conditions without reserve. He wrote his inaugural address in Washington, using the following language:

* Geary to Marcy, Feb. 21st, 1857. Senate Docs., 1st Sess. 35th Cong., Vol. VI., Ex. Doc. 17, p. 178.

† March 7th, 1856. ‡ June 25th, 1856.

§ Bigler, Senate Speech, Dec. 9th, 1857. *Globe*, Part I., p. 21. See also Bigler, Senate Speech, Dec. 21st, 1857. *Globe*, Part I., p. 113.

FREDERICK P. STANTON. (FROM A PHOTOGRAPH BY BRADY.)

"I repeat then as my clear conviction that unless the convention submit the constitution to the vote of all the actual resident settlers, and the election be fairly and justly conducted, the constitution will be and ought to be rejected by Congress."

He submitted this draft of his inaugural to President Buchanan, who read and approved the document and the promise. Secretary Cass wrote his official instructions in accordance with it. On Walker's journey West he stopped at Chicago and submitted his inaugural to Douglas, who also indorsed his policy.** The new governor fondly believed he had removed every obstacle to success, and every possibility of misunderstanding or disapproval by the Administration, such as had befallen his predecessors. But President Buchanan either deceived him at the beginning, or betrayed him in the end.

With Governor Walker there was sent a new territorial secretary. Woodson, who had

|| Douglas, Milwaukee Speech, October 13th, 1860.

so often abused his powers during his repeated service as acting governor, was promoted to a more lucrative post to create the vacancy. Frederick P. Stanton, of Tennessee, formerly a representative in Congress, a man of talent and, as the event proved, also a man of courage, was now made Secretary. Both Walker and Stanton being from slave States, it may be presumed that the slavery question was considered safe in their hands. Walker, indeed, entertained sentiments somewhat more valuable to the South in this conjuncture. He believed in the balance of power; he preferred that the people of Kansas should make it a slave State; he was "in favor of maintaining the equilibrium of the government by giving the South a majority in the Senate, while the North would always necessarily have a majority in the House of Representatives."* Both also entered on their mission with the feelings entertained by the President and the Democratic party; namely, that the free-State men were a mischievous insurrectionary faction, willfully disturbing the peace and defying the laws. Gradually, however, their personal observation convinced them that this view was a profound error.

Governor Walker arrived in the Territory late in May, and it required but short investigation to satisfy him that any idea of making Kansas a slave State was utterly preposterous. Had everything else been propitious, climate alone seemed to render it impossible. But popular sentiment was also overwhelmingly against it; he estimated that the voters were for a free State more than two to one.† All the efforts of the pro-slavery party to form a slave State seemed to be finally abandoned. If he could not make Kansas a slave State, his next desire was to make her a Democratic State. "And the only plan to accomplish this was to unite the free-State Democrats with the pro-slavery party, and all those whom I regarded as conservative men, against the more violent portion of the Republicans."‡ He therefore sought by fair words to induce the free-State men to take part in the election of delegates to the constitutional convention. His inaugural address, quoting the President's instructions, promised that such election should be free from fraud and violence; that the delegates should be protected in their deliberations; and that if unsatisfactory, "you may by a subsequent vote defeat the ratification of the constitution."§

This same policy was a few weeks later urged

at Topeka, where a mass meeting of the free-State men was called to support and instruct another sitting of the "insurrectionary" free-State legislature elected under the Topeka constitution. The governor found a large assemblage, and a very earnest discussion in progress, whether the "legislature" should pursue only nominal action, such as would in substance amount to a petition for redress of grievances, or whether they should actually organize their State government, and pass a complete code of laws. The moderate free-State men favored the former, the violent and radical the latter course. When their mass meeting adjourned, they proceeded to the governor's lodgings and called him out in a speech, in which he renewed the counsels and promises of his inaugural address. "The legislature," said he, "has called a convention to assemble in September next. That constitution they will or they will not submit to the vote of a majority of the then actual resident settlers of Kansas. If they do not submit it, I will join you, fellow-citizens, in lawful opposition to their course. And I cannot doubt, gentlemen, that one much higher than I, the Chief Magistrate of the Union, will join you in that opposition."|| His invitation to them to participate in the election of a convention produced no effect; they still adhered to their resolve to have nothing to do with any affirmative proceedings under the bogus laws or territorial legislature. But the governor's promise of a fair vote on the constitution was received with favor. "Although this mass convention," reports the governor, "did not adopt fully my advice to abandon the whole Topeka movement, yet they did vote down by a large majority the resolutions prepared by the more violent of their own party in favor of a complete State organization and the adoption of a code of State laws."

If the governor was gratified at this result as indicative of probable success in his official administration, he rejoiced yet more in its significance as a favorable symptom of party politics. "The result of the whole discussion at Topeka," he reports, "was regarded by the friends of law and order as highly favorable to their cause, and as the commencement of a great movement essential to success; viz., the separation of the free-State Democrats from the Republicans, who had to some extent heretofore coöperated under the name of the free-State party."** Another party symptom gave

the governor equal, if not greater, encouragement. On the 2d and 3d of July the "National Democratic" or pro-slavery party of the Territory met in convention at Lecompton. The leaders were out in full force. The hopelessness of making Kansas a slave State was once more acknowledged, the governor's policy indorsed, and a resolution "against the submission of the constitution to a vote of the people was laid on the table as a test vote by a vote of forty-two to one." * The governor began already to look upon his counsels and influence as a turning-point in national destiny. "Indeed," he writes, "it is universally admitted here that the only real question is this: whether Kansas shall be a conservative, constitutional, Democratic, and ultimately free State, or whether it shall be a Republican and abolition State; and that the course pursued by me is the only one which will prevent the last most calamitous result, which, in my opinion, would soon seal the fate of the republic." †

In his eagerness to reform the Democratic party of Kansas, and to strengthen the Democratic party of the nation against the assaults and dangers of "abolitionism," the governor was not entirely frank; else he would at the same time have reported, what he was obliged later to explain, that the steps taken to form a constitution from which he hoped so much were already vitiated by such defects or frauds as to render them impossible of producing good fruit. The territorial law appointing the election of delegates provided for a census and a registry of voters, to be made by county officers appointed by the territorial legislature. These officers so neglected or failed to discharge their duty, that in nearly half the organized counties of the interior no attempt whatever was made to obtain the census or registration; ‡ and in the counties lying on the Missouri border, where the pro-slavery party was strong, the work of both was exceedingly imperfect, and in many instances with notorious discrimination against free-State voters. While the disfranchised counties had a comparatively sparse population, the number of voters in them was too considerable to be justly denied their due representation. § The apportionment of delegates was based upon this defective registration and census, and this alone would have given the pro-slavery party a disproportionate power in the convention. But at the election

of delegates on the 15th of June, the free-State men, following their deliberate purpose and hitherto unvarying practice of non-conformity to the bogus laws, abstained entirely from voting. "The consequence was that out of the 9250 voters whose names had been registered . . . there were in all about 2200 votes cast, and of these the successful candidates received 1800." ||

"The black Republicans," reported the governor, "would not vote, and the free-State Democrats were kept from voting by the fear that the constitution would not be submitted by the convention, and that by voting they committed themselves to the proceeding of the convention. But for my inaugural, circulated by thousands, and various speeches all urging the people to vote, there would not have been one thousand votes polled in the Territory, and the convention would have been a disastrous failure." ¶

But this was not the only evil. The apportionment of the members of the territorial legislature to be chosen the ensuing autumn was also based upon this same defective registry and census. Here again disproportionate power accrued to the pro-slavery party, and the free-State men loudly charged that it was a new contrivance for the convenience of Missouri voters. Governor Walker publicly deplored all these complications and defects; but he counseled endurance, and constantly urged in mitigation that in the end the people should have the privilege of a fair and direct vote upon their constitution. That promise he held aloft as a beacon-light of hope and redress. This attitude and policy, frequently reported to Washington, was not disavowed or discouraged by the President and Cabinet.

The governor, however, soon found a storm brewing in another quarter. When the newspapers brought copies of his inaugural address, his Topeka speech, and the general report of his Kansas policy back to the Southern States, there arose an ominous chorus of protest and denunciation from the whole tribe of fire-eating editors and politicians. What right had the governor to intermeddle? they indignantly demanded. What call to preach about climate, what business to urge submission of the constitution to popular vote, or to promise his own help to defeat it if it were not submitted; what author-

even with the six months' qualification, than the whole vote given to the delegates who signed the Lecompton constitution on the 7th November last."—[Walker to Cass, December 15th, 1857. Senate Docs., 1st Sess. 35th Cong., Vol. I., Ex. Doc. 8, p. 128.]

‡ F. P. Stanton's Speech, Philadelphia, February 8th, 1858.

§ "These fifteen counties in which there was no registry gave a much larger vote at the October election,

ty to pledge the President and Administration to such a course? The convention was sovereign, they claimed, could do what it pleased, and no thanks to the governor for his impudent advice. The Democratic State Convention of Georgia took the matter in hand, and by resolution denounced Walker's inaugural address, and asked his removal from office. The Democratic State Convention of Mississippi followed suit, and called the inaugural address an unjust discrimination against the rights of the South, and a dictatorial intermeddling with the high public duty intrusted to the convention.

Walker wrote a private letter to Buchanan, defending his course, and adding:

"Unless I am thoroughly and cordially sustained by the Administration here, I cannot control the convention, and we shall have anarchy and civil war. With that end in view the convention (a majority of whose delegates I have already seen) will do what is right. I shall travel over the whole Territory, make speeches, win the people in favor of my plan, and get all the delegates. But your cordial support is indispensable, and I never would have come here, unless assured by you of the cordial coöperation of all the Federal officers. . . . The extremists are trying your nerves and mine, but what can they say when the convention submits the constitution to the people and the vote is given by them? But we must have a slave State out of the south-western Indian Territory, and then a calm will follow; Cuba be acquired with the acquiescence of the North; and your Administration, having in return settled the slavery question, be regarded in all time to come as a re-signing and re-sealing of the constitution. . . . I shall be pleased soon to hear from you. Cuba! Cuba! (and Porto Rico, if possible) should be the countersign of your Administration, and it will close in a haze of glory."*

The governor had reason to be proud of the full and complete reëndorsement which this appeal brought from his chief. Under date of July 12th, 1857, the President wrote in reply:

"On the question of submitting the constitution to the *bonâ fide* resident settlers of Kansas I am willing to stand or fall. In sustaining such a principle we cannot fall. It is the principle of the Kansas-Nebraska bill; the principle of popular sovereignty; and the principle at the foundation of all popular government. The more it is discussed the stronger it will become. Should the convention of Kansas adopt this principle, all will be settled harmoniously, and with the blessing of Providence you will return triumphantly from your arduous, important, and responsible mission. The strictures of the Georgia and Mississippi conventions will then pass away and be speedily forgotten. In regard to Georgia, our news from that State is becoming better every day; we have not yet had time to hear much from Mississippi. Should you answer the resolutions of the latter I would advise you to make the great principle of the submission of the constitution to the *bonâ fide* residents of Kansas conspicuously prominent. On this you will be irresistible."†

The delegates to the constitutional convention, chosen in June, met according to law

* Walker to Buchanan, June 28th, 1857. Report Covode Committee, pp. 117-119.

at Lecompton, September 7th, and, having spent five days in organization, adjourned their session to October 19th. The object of this recess was to await the issue of the general election of October 5th, at which a full territorial legislature, a delegate to Congress, and various county officers were to be chosen.

By the action of the free-State men this election was now made a turning-point in Kansas politics. Held together as a compact party by their peaceful resistance to the bogus laws, emigration from the North had so strengthened their numbers that they clearly formed a majority of the people of the Territory. A self-constituted and self-regulated election held by them for sundry officials under their Topeka constitution revealed a numerical strength of more than seven thousand voters. Feeling that this advantage justified them in receding from their attitude of non-conformity, they met in convention toward the end of August, and while protesting against the "wicked apportionment," resolved that "whereas Governor Walker has repeatedly pledged himself that the people of Kansas should have a full and fair vote, before impartial judges, at the election to be held on the first Monday in October, . . . we the people of Kansas, in mass convention assembled, agree to participate in said election."‡

Governor Walker executed his public promises to the letter. A movement of United States troops to Utah was in progress, and about two thousand of these were detained by order until after election day. Stationed at ten or twelve different points in the Territory, they served by their mere presence to overawe disorder, and for the first time in the history of Kansas the two opposing parties measured their strength at the ballot-box. The result was an overwhelming triumph for the free-State party. For delegate in Congress, Ransom, the Democratic candidate, received 3799 votes; Parrott, the Republican candidate, 7888,—a free-State majority of 4089. For the legislature, even under the defective apportionment, the council stood 9 free-State members to 4 Democrats, and the House 24 free-State members to 15 Democrats.

That the pro-slavery cabal would permit power to slip from their grasp without some extraordinary effort was scarcely to be expected. When the official returns were brought from the various voting-places to the governor's office, there came from Oxford, a single precinct in Johnson county, "a roll of paper, 40 or 50 feet long, containing names as thickly

† Buchanan to Walker, July 12th, 1857. Report Covode Committee, p. 112.

‡ Wilder, p. 133.

as they could be written,"* and a large part of which were afterward discovered to have been literally copied from an old Cincinnati directory. This paper purported to be a return of 1628 votes for the 11 pro-slavery candidates for the legislature in that district, and if counted, it would elect 8 members of the House and 3 of the council by a trifling majority, and thereby change the political complexion and power of the legislature. Inspection showed the document to be an attempt to commit a stupendous fraud; and after visiting the locality ("a village with six houses, including stores, and without a tavern")† and satisfying himself of the impossibility of such a vote from such a place, Governor Walker rejected the whole return from Oxford precinct for informality, and gave certificates of election to the free-State candidates elected as appeared by the other regular returns. A similar paper from McGee county with more than 1200 names was treated in like manner.‡ Judge Cato issued his writ of mandamus to compel the governor to give certificates to the pro-slavery candidates, but without success. The language of Governor Walker and Secretary Stanton in a proclamation announcing their action deserves remembrance and imitation.

"The consideration that our own party by this decision will lose the majority in the legislative assembly does not make our duty in the premises less solemn and imperative. The elective franchise would be utterly valueless, and free government itself would receive a deadly blow, if so great an outrage as this could be shielded under the cover of mere forms and technicalities. We cannot consent in any manner to give the sanction of our respective official positions to such a transaction. Nor can we feel justified to relieve ourselves of the proper responsibility of our offices, in a case where there is no valid return, by submitting the question to the legislative assembly, and in that very act giving the parties that might claim to be chosen by this spurious vote the power to decide upon their own election."§

The decisive free-State victory, the Oxford and McGee frauds,|| and the governor's fearless action in exposing and rejecting them, called forth universal comment; and under the new political conditions which they re-

vealed, created intense interest in the further proceedings of the Lecompton Constitutional Convention. That body reassembled according to adjournment on the 19th of October. Elected in the preceding June without any participation by free-State voters, the members were all pro-slavery, and were presided over by John Calhoun (the same man who, as county surveyor of Sangamon county, Illinois, employed Abraham Lincoln as his deputy in 1832).

At the June election, while he and his seven colleagues from Douglas county were yet candidates for the convention, they had circulated a written pledge that they would submit the constitution to the people for ratification. This attitude was generally maintained by them till the October election. But when by that vote they saw their faction overwhelmed with defeat, they and others undertook to maintain themselves in power by an unprecedented piece of political jugglery. Calhoun, who was surveyor-general of the Territory, employed a large number of subordinates, and was one of the most able and unscrupulous leaders in the pro-slavery cabal. A large majority of the convention favored the establishment of slavery; only the question of a popular vote on ratification or rejection excited controversy.

An analysis shows that the principle of delegated authority had become attenuated to a remarkable degree. The defective registration excluded a considerable number (estimated at about one-sixth) of the legal voters. Of the 9250 registered, only about 2200 voted, all told. Of these 2200, only about 1800 votes were given for the successful candidates for delegate. Of the whole 60 delegates alleged to have been chosen, "but 43," says a Committee Report,

"participated in the work of the convention. Sessions were held without a quorum, and the yeas and nays often show that but few above thirty were present. It is understood, and not denied, that but 28 of these — less than half of a full house of 60 — decided the pro-slavery or free-State question; and upon the question of submission of their work to the will of the people, the pro-slavery party carried the point by a majority of two votes only. It was quite in keeping

|| The ingenuity which evolved 1600 Kansas votes from an old Cincinnati directory and 1200 more from an uninhabited county, was not exhausted by that prodigious labor. The same influences, and perhaps the same manipulators, produced a companion piece known by the name of the "candle-box fraud." At the election of January 4th, 1858, for officers under the Lecompton constitution, the returns from Delaware

Agency underwent such suspicious handling that an investigating commission of the Legislature, by aid of a search-warrant, found them secreted in a candle-box buried under a wood-pile near Calhoun's "Surveyor-General's office" at Lecompton. A forged list of 379 votes had been substituted for the original memorandum of only 43 votes cut from the certificate of the judges; the votes on the forged list being intended for the pro-slavery candidates. During the investigation Calhoun was arrested, but liberated by Judge Cato on *habeas corpus*, after which he immediately went to Missouri, and from there to Washington. The details and testimony are found in House Com. Reports, 1st Sess. 35th Cong., Vol. III., Report No. 377.

with the character of this body and its officers to find the journal of its proceedings for the last days missing.

Their allotted task was completed in a short session of about three weeks; the convention adjourned November 7th, 43 of the 50 delegates present having been induced to sign the constitution. When the document was published the whole country was amazed to see what perversity and ingenuity had been employed to thwart the unmistakable popular will. Essentially a slave-State constitution of the most pronounced type, containing the declaration that the right of property in slaves is "before and higher than any constitutional sanction," it made the right to vote upon it depend on the one hand on a test oath to "support this constitution" in order to repel conscientious free-State voters, and on the other hand on mere inhabitancy on the day of election to attract nomadic Missourians; it postponed the right to amend or alter for a period of seven years; it kept the then existing territorial laws in force until abrogated by State legislation; it adopted the late Oxford fraud as a basis of apportionment; it gave to Calhoun, the presiding officer, power to make the precincts, the judges of election, and to decide finally upon the returns in the vote upon it, besides many other questionable or inadmissible provisions. Finally the form of submission to popular vote to be taken on the 21st of December was prescribed to be, "constitution with slavery" or "constitution with no slavery," thus compelling the adoption of the constitution in any event.

There is a personal and political mystery underlying this transaction which history will probably never solve. Only a few points of information have come to light, and they serve to embarrass rather than aid the solution. The first is that Calhoun, although the friend and protector of Douglas, and also himself personally pledged to submission, came to the governor and urged him to join in the new programme as to slavery,—alleging that the Administration had changed its policy, and now favored this plan,—and tempted Walker with a prospect of the Presidency if he would concur. Walker declared such a change impossible, and indignantly spurned the proposal.† The second is that one Martin, a department clerk, was, after confidential instructions from Secretary

Thompson and Secretary Cobb, of Buchanan's Cabinet, sent to Kansas in October, ostensibly on department business; that he spent his time in the lobby and the secret caucuses of the convention. Martin testifies that these Cabinet members favored submission, but that Thompson wished it understood that he was unwilling to oppose the admission of Kansas "if a pro-slavery constitution should be made and sent directly to Congress by the convention."‡ A wink was as good as a nod with that body, or rather with the cabal which controlled it; and after a virtuous dumb-show of opposition, it made a pretense of yielding to the inevitable, and acted on the official suggestion. This theory is the more plausible because Martin testifies further that he himself drafted the slavery provision which was finally adopted.§ The third point is that the President inexcusably abandoned his pledges to the governor and adopted this Cobb-Thompson-Calhoun contrivance, instead of keeping his word and dismissing Calhoun, as honor dictated. This course becomes especially remarkable in view of the fact that the change did not occur until after Walker's rejection of the fraudulent Oxford returns, which action placed the legislative power of the Territory in the hands of the newly elected free-State legislature, as already related. On the same day (October 22d, 1857) on which Walker and Stanton issued their proclamation rejecting the fraudulent returns, President Buchanan wrote another highly commendatory letter to Governor Walker. As it has never before been published, its full text will have special historical interest.

"WASHINGTON CITY, 22d October, 1857.

"MY DEAR SIR: I have received your favor of the tenth instant by Captain Pleasonton and am rejoiced to learn from you, what I had previously learned from other less authentic sources, that the convention of Kansas will submit the constitution to the people. It is highly gratifying that the late election passed off so peacefully; and I think we may now fairly anticipate a happy conclusion to all the difficulties in that Territory. Your application for a month's leave of absence has been granted to commence after the adjournment of the convention. During its session your presence will be too important to be dispensed with. I shall be glad to see you before you publish anything. The whole affair is now gliding along smoothly. Indeed, the revulsion in the business of the country seems to have driven all thoughts of 'bleeding Kansas' from the public mind. When and in what manner anything shall be published to revive the feeling, is a question of serious importance. I am persuaded that with every passing day the public are more and more disposed to

the submission clause of the schedule, and the authenticity of the document rests upon the signatures and the certificate of John Calhoun.

§ Report Covode Committee, pp. 170-1.

* Minority Report, Select Com. of Fifteen. Report No. 377, page 109, Vol. III., H. R. Reports, 1st Sess. 35th Cong.

This "missing link," no less than the remaining portion of the journal printed in the proceedings of the investigating committee, is itself strong circumstantial proof of the imposture underlying the whole transaction. Many sections of the completed constitution are not even mentioned in the journal: it does not contain

do you justice. You certainly do injustice to Harris, the editor of the 'Union.' In the beginning I paid some attention to the course of the paper in regard to yourself, and I think it was unexceptionable: I know he stood firm amidst a shower of abuse from the extremists. I never saw nor did I ever hear of the communication published in the 'Union' to which you refer, and Harris has no recollection of it. I requested him to find me the number and send it to me; but this he has not done. He is not responsible in any degree for the non-publication of the letters to which you refer.* I knew nothing of them until after the receipt of yours; and upon inquiry I found their publication had been prevented by Mr. Cobb under a firm conviction that they would injure both yourself and the Administration. Whether he judged wisely or not I cannot say, for I never saw them. That he acted in fairness and friendship I have not a doubt. He was anxious that General Whitfield should publish a letter and prepared one for him, expecting he would sign it before he left. He sent this letter after him for his approval and signature; but it has not been returned. I know not what are its contents. General W. doubtless has the letter in his possession. Beyond all question, the motives of Mr. Cobb were proper. Mrs. Walker and Mrs. Bache have just left me after a half hour's very agreeable conversation. Mrs. Walker desires me to inform you the family are all well and sends her love.

"From your friend, very respectfully,

"JAMES BUCHANAN.

"Hon. ROBERT J. WALKER."†

The question naturally occurs, for whom did Calhoun speak when he approached Governor Walker, offering him the bribe of the Presidency and assuring him that the Administration had changed its mind? That was before, or certainly not long after, the probable receipt of this letter in Kansas, for the governor left the Territory (November 16th) about one week after the adjournment of the Lecompton convention. The question becomes still more pressing owing to Governor Walker's testimony that when he reached Washington, "the President himself distinctly and emphatically assured me that he had not authorized anybody to say that he had approved of that [Lecompton] programme."‡ On whose authority, then, did Calhoun declare that the Administration had changed its mind?

This query brings us to another point in President Buchanan's letter of October 22d, in which he mentions that Secretary Cobb, of his Cabinet, had without his knowledge suppressed the publication of certain letters in the "Washington Union." These were, as we learn elsewhere, § the letters in which some of

the Kansas pro-slavery leaders repeated their declaration of the hopelessness of any further contest to make Kansas a slave State. Why this secret suppression by Secretary Cobb? There is but one plausible explanation of this whole chain of contradictions. The conclusion is almost forced upon us that a Cabinet intrigue, of which the President was kept in ignorance, was being carried on, under the very eyes of Mr. Buchanan, by those whom he himself significantly calls "the extremists,"—a plot to supersede his own intentions and make him falsify his own declarations. As in the case of similar intrigues by the same agents a few years later, he had neither the wit to perceive nor the will to resist.

The protest of the people of the Territory against the extraordinary action of the Lecompton convention almost amounted to a popular revolt. This action opened a wide door to fraud, and invited Missouri over to an invasion of final and permanent conquest. Governor Walker had quitted the Territory on his leave of absence, and Secretary Stanton was acting governor. "The people in great masses," he says, "and the legislature that had been elected, with almost an unanimous voice called upon me to convene the legislature, in order that they might take such steps as they could to counteract the misfortune which they conceived was about to befall them in the adoption of this constitution."|| As already stated, Stanton had come to Kansas with the current Democratic prejudices against the free-State party. But his whole course had been frank, sincere, and studiously impartial, and the Oxford fraud had completely opened his eyes. "I now discovered for the first time to my entire satisfaction why it was that the great mass of the people of the Territory had been dissatisfied with their government, and were ready to rebel and to throw it off."¶ Having, like Walker, frequently and earnestly assured the people of their ultimate right to ratify or reject the work of the convention, he was personally humiliated by the unfairness and trickery of which that body was guilty. Under the circumstances he could not hesitate in his duty. By proclamation he convened the new legislature in extra session.

The members respected the private pledge

* "Dr. Tebbs and General Whitfield a month since left very strong letters for publication with the editor of the 'Union' which he promised to publish. His breach of this promise is a gross outrage. If not published immediately our success in convention materially depends on my getting an immediate copy at Lecompton. My friends here all regard now the 'Union' as an enemy and encouraging by its neutrality the fire-eaters not to submit the constitution. Very well, the facts are so clear that I can get along without the 'Union,' but he had no right to suppress

Dr. Tebbs's letter. I shall in due time expose that transaction."—[R. J. Walker to James Buchanan, October, 1857. Extract.]

† For this autograph letter and other interesting manuscripts, we are indebted to General Duncan S. Walker, a son of the governor, now residing in Washington, D. C.

‡ Report Covode Committee, p. 111.

§ John Bell, Senate Speech, March 18th, 1858.

|| Stanton, Philadelphia Speech, Feb. 8th, 1858.

¶ Ibid.

they had given him to engage in no general legislation; but provided by law for an investigation of the Oxford and McGee frauds, and for an election to be held on January 4th, 1858 (the day fixed by the Lecompton constitution for the election of State officers and a State legislature), at which the people might vote for the Lecompton constitution or against it. Thus in course of events two separate votes were taken on this notorious document. The first, provided for in the instrument itself, took place on the 21st of December, 1857. Detachments of troops were stationed at several points: the free-State men abstained from voting; the election was peaceable; and in due time Calhoun proclaimed that 6143 ballots had been cast "for the constitution with slavery," and 589 "for the constitution with no slavery." But the subsequent legislative investigation disclosed a gross repetition of the Oxford fraud, and proved the actual majority, in a one-sided vote, to have been only 3423. The second election occurred on January 4th, 1858, under authority of the legislative act. At this election the pro-slavery party voted for the State officers, but in its turn abstained from voting on the constitution, the result being,—against the Lecompton constitution, 10,226; for the Lecompton constitution with slavery, 138; for the Lecompton constitution without slavery, 24.*

This emphatic rejection of the Lecompton constitution by a direct vote of the people of Kansas sealed its fate. We shall see further on what persistent but abortive efforts were made in Congress to once more galvanize it into life. The free-State party was jubilant; but the pro-slavery cabal, foiled and checked, was not yet dismayed or conquered. For now there was developed, for the first time in its full proportions, the giant pro-slavery intrigue which proved that the local conspiracy of the Atchison-Missouri cabal was but the image and fraction of a national combination, finding its headquarters in the Administration, first of President Pierce, and now of President Buchanan; working as patiently and insidiously as the order of Jesuits in the Church of Rome, through successive efforts to bring about a practical subversion of the whole theory and policy of the American government. It linked the action of Border Ruffians, presidential as-

pirants, senates, courts, and cabinets into efficient coöperation; leading up, step by step, from the repeal of the Missouri Compromise, through the Nebraska bill, border conquest, the Dred Scott decision, the suppression of the submission clause in the Toombs bill, and the extraordinary manipulation and machinery of the Lecompton constitution, toward the final overthrow of the doctrine that "all men are created equal," and the substitution of the dogma of property in man; toward the judicial construction that property rights in human beings are before and above constitutional sanction, and that slavery must find protection and perpetuity in States as well as in Territories.

The first weather-sign came from Washington. On the day after Acting Governor Stanton convened the October Legislature in special session, and before news of the event reached him, Secretary Cass transmitted to him advance copies of the President's annual message, in which the Lecompton constitution was indorsed in unqualified terms.† A week later he was admonished to conform to the views of the President in his official conduct.‡ At this point the State Department became informed of what had taken place, and the acting governor had short shrift. On December 11th Cass wrote to J. W. Denver, Esq.: "You have already been informed that Mr. Stanton has been removed from the office of Secretary of the Territory of Kansas and that you have been appointed in his place." Cass further explained that the President

"was surprised to learn that the secretary and acting governor had, on the 1st of December, issued his proclamation for a special session of the territorial legislature on the 7th instant, only a few weeks in advance of its regular time of meeting, and only fourteen days before the decision was to be made on the question submitted by the convention. This course of Mr. Stanton, the President seriously believes, has thrown a new element of discord among the excited people of Kansas, and is directly at war, therefore, with the peaceful policy of the Administration. For this reason he has felt it his duty to remove him."§

Walker, already in Washington on leave of absence, could no longer remain silent. He was as pointedly abandoned and disgraced by the Administration as was his subordinate. In a dignified letter justifying his own course, which, he reminded them, had never been criticised or disavowed, he resigned the governorship.

"From the events occurring in Kansas as well as here," he wrote, "it is evident that the question is passing from theories into practice; and that as governor of Kansas I should be compelled to carry out new instructions, differing on a vital question from those received at the date of my appointment. Such instructions I could not execute consistently with my views of the Federal Constitution, of the Kansas and

* Under an Act of Congress popularly known as the "English Bill," this same Lecompton constitution was once more voted upon by the people of Kansas on August 2d, 1858, with the following result: for the proposition, 1,788; against it, 11,300.—[Wilder, pp. 186-8.]

† Cass to Stanton, December 2d, 1857. *Senate Docs.*, 1st Sess. 35th Cong., Vol. I., Doc. 8, p. 112.

§ Cass to Denver, December 11th, 1857. *Ibid.*, p. 120.

Nebraska bill, or with my pledges to the people of Kansas." "The idea entertained by some that I should see the Federal Constitution and the Kansas-Nebraska bill overthrown and disregarded, and that, playing the part of a mute in a pantomime of ruin, I should acquiesce by my silence in such a result, especially where such acquiescence involved, as an immediate consequence, a disastrous and sanguinary civil war, seems to me most preposterous." *

The conduct and the language of Walker and Stanton bear a remarkable significance when we remember that they had been citizens of slave States and zealous Democratic partisans, and that only hard practical experience and the testimony of their own eyes had forced them to join their predecessors in the political "graveyard." "The ghosts on the banks of the Styx," said Seward, "constitute a cloud scarcely more dense than the spirits of the departed governors of Kansas, wandering in exile and sorrow for having certified the truth against falsehood in regard to the elections between Freedom and Slavery in Kansas." †

THE REVOLT OF DOUGLAS.

THE language of President Buchanan's annual message, the summary dismissal of Acting Governor Stanton, and the resignation of Governor Walker, abruptly transferred the whole Lecompton question from Kansas to Washington; and even before the people of the Territory had practically decided it by the respective popular votes of December 21st, 1857, and January 4th, 1858, it had become the dominant political issue in the Thirty-fifth Congress, which convened on December 7th, 1857. The attitude of Senator Douglas on the new question claimed universal attention. The Dred Scott decision, affirming constitutional sanction and inviolability for slave property in Territories, had rudely damaged his theory. But we have seen how in his Springfield speech he ingeniously sought to repair and rehabilitate "popular sovereignty" by the sophism that a master's abstract constitutional right to slave property in a Territory was a "barren and a worthless right unless sustained, protected, and enforced by appropriate police regulations," which could only be supplied by the local territorial legislatures; and that the people of Kansas thus still possessed the power of indirect prohibition.

To invent and utter this sophism for home consumption among his distant constituents on the 12th of June (a few days before the Lecompton delegates were elected), and in so unobtrusive a manner as scarcely to attract

a ripple of public notice, was a light task compared with that which confronted him as Senator, at the meeting of Congress in December, in the light of John Calhoun's doings and powers, of the scandal of the Oxford fraud, and of the indignation of Northern Democrats against the betrayal of Walker and Stanton.

One of his first experiences was a personal quarrel with Buchanan. When he reached Washington, three days before the session, he went to the President to protest against his adopting the Lecompton constitution and sending it to Congress for acceptance. Buchanan insisted that he must recommend it in his annual message. Douglas replied that he would denounce it as soon as it was read. The President, excited, told him to remember "that no Democrat ever yet differed from an administration of his own choice without being crushed. Beware of the fate of Tallmadge and Rives," added he. "Mr. President," retorted Douglas, "I wish you to remember that General Jackson is dead." ‡

In the election of Mr. Buchanan as President the South had secured a most important ally for the work of pro-slavery reaction. Trained in the belief that the South had hitherto been wronged, he was ready on every occasion to appear as her champion for redress; and the Southern politicians were now eager to use his leadership to make their views of public policy and constitutional duty acceptable to the North. Mediocre in talent and feeble in will, he easily submitted to control and guidance from a few Southern leaders of superior intellectual force. In his inaugural, he sought to prepare public opinion for obedience to the Dred Scott decision, and since its publication he had undertaken to interpret its scope and effect. Replying to a memorial from certain citizens of New England, he declared in a public letter, "Slavery existed at that period, and still exists in Kansas, under the Constitution of the United States. This point has at last been finally decided by the highest tribunal known to our laws. How it could ever have been seriously doubted is a mystery." § In the same letter he affirmed the legality of the Lecompton convention, though he yet clearly expressed his expectation that the constitution to be framed by it would be submitted to popular vote for "approbation or rejection."

But when that convention adjourned, and made known its cunningly devised work, the whole South instantly became clamorous to secure the sectional advantages which lay in its

JOHN CALHOUN. FROM A PAINTING BY D. V. FARRINGTON, AFTER A SCULPTURE BY BRADY, OWNED BY JOSEPH LEBLANC, ESQ.

technical regularity, its strong affirmance of the "property" theory, and the extraordinary power it gave to John Calhoun to control the election and decide the returns. This powerful reactionary movement was not lost upon Mr. Buchanan. He reflected it as unerringly as the vane moves to the change of the wind. Long before the meeting of Congress, the Administration organ, the "Washington Union," heralded and strongly supported the new departure. When, on the 8th of December, the President's annual message was transmitted and read, the Lecompton constitution, as framed and submitted, was therein warmly indorsed and its acceptance indicated as the future Administration policy.

The language of this message discloses with what subtle ingenuity words, phrases, definitions, ideas, and theories were being invented and plied to broaden and secure every coigne of vantage, every conquest of the pro-slavery reaction. An elaborate argument was made to defend the enormities of the Lecompton constitution. The doctrine of the Silliman letter, that "slavery exists in Kansas under the Constitution of the United States," was assumed as a conceded theory. "In emerging from the condition of territorial dependence into that of a sovereign State," the people might vote "whether this important domestic institution should or should not continue to

exist." "Domestic institutions" was defined to mean slavery. "Free to form and regulate their domestic institutions"—the phrase employed in the Kansas-Nebraska act—was construed to mean a vote to continue or discontinue slavery. And "if any portion of the inhabitants shall refuse to vote, a fair opportunity to do so having been presented, . . . they alone will be responsible for the consequences." "Should the constitution without slavery be adopted by the votes of the majority, the rights of property in slaves now in the Territory are reserved. . . . These slaves were brought into the Territory under the Constitution of the United States and are now the property of their masters. This point has at length been finally decided by the highest judicial tribunal of the country."*

However blind Buchanan might be to the fact that this extreme interpretation shocked and alarmed the sentiment of the North; that if made before the late presidential campaign it would have defeated

his own election; and that if rudely persisted in, it might destroy the Democratic ascendancy in the future, the danger was obvious and immediately vital to Douglas. His senatorial term was about to expire. To secure a reëlection he must carry the State of Illinois in 1858, which had on an issue less pronounced than this defeated his colleague Shields in 1854, and his lieutenant Richardson in 1856. But more than this, his own personal honor was as much involved in his pledges to the voters of Illinois as had been that of Governor Walker to the voters of Kansas. His double-dealing caucus bargain had thus placed him between two fires,—party disgrace at Washington and popular disgrace in Illinois. In such a dilemma his choice could not be doubtful. At all risk he must endeavor to sustain himself at home.

He met the encounter with his usual adroitness and boldness. Assuming that the President had made no express recommendation, he devoted his speech mainly to a strong argument of party expediency, repelling without reserve and denouncing without stint the work of the Lecompton convention.

"Stand by the doctrine," said he, "that leaves the people perfectly free to form and regulate their institutions for themselves, in their own way, and your party will be united and irresistible in power. Abandon

* Buchanan, Annual Message, Dec. 8th, 1857.

that great principle, and the party is not worth saving, and cannot be saved after it shall be violated. I trust we are not to be rushed upon this question. Why shall it be done? Who is to be benefited? Is the South to be the gainer? Is the North to be the gainer? Neither the North nor the South has the right to gain a sectional advantage by trickery or fraud. . . . But I am told on all sides, 'Oh! just wait; the pro-slavery clause will be voted down.' That does not obviate any of my objections; it does not diminish any of them. You have no more right to force a free-State constitution on Kansas than a slave-State constitution. If Kansas wants a slave-State constitution she has a right to it; if she wants a free-State constitution she has a right to it. It is none of my business which way the slavery clause is decided. I care not whether it is voted down or voted up. Do you suppose, after the pledges of my honor, that I would go for that principle and leave the people to vote as they choose, that I would now degrade myself by voting one way if the slavery clause be voted down, and another way if it be voted up? I care not how that vote may stand. . . . Ignore Lecompton; ignore Topeka; treat both those party movements as irregular and void; pass a fair bill — the one that we framed ourselves when we were acting as a unit; have a fair election — and you will have peace in the Democratic party, and peace throughout the country, in ninety days. The people want a fair vote. They will never be satisfied without it. . . . But if this constitution is to be forced down our throats in violation of the fundamental principle of free government, under a mode of submission that is a mockery and insult, I will resist it to the last."

President Buchanan and the strong pro-slavery faction which was directing his course paid no attention whatever to this proposal of a compromise. Shylock had come into court to demand his bond, and would heed no pleas of equity or appeals to grace. The elections of December 21st and January 4th were held in due time, and with what result we have already seen. John Calhoun counted the votes on January 13th, and declared the "Lecompton constitution with slavery" duly adopted, prudently reserving, however, any announcement concerning the State officers or legislature under it. This much accomplished, he hurried away to Washington, where he was received with open arms by the President and his advisers, who at once proceeded with a united and formidable effort to legalize the transparent farce by Congressional sanction.

On the second day of February, 1858, President Buchanan transmitted to Congress the Lecompton constitution, "received from J. Calhoun, Esq.," and "duly certified by himself." The President's accompanying special message argues that the organic law of the Territory conferred the essential rights of an enabling act; that the free-State party stood in the attitude of willful and chronic revolution; that their various refusals to vote were a sufficient bar to complaint and objection; that the several steps in the creation and work

of the Lecompton convention were regular and legal.

"The people of Kansas have, then, 'in their own way,' and in strict accordance with the organic act, framed a constitution and State government, have submitted the all-important question of slavery to the people, and have elected a governor, a member to represent them in Congress, members of the State legislature, and other State officers. They now ask admission into the Union under this constitution, which is Republican in form. It is for Congress to decide whether they will admit or reject the State which has thus been created. For my own part I am decidedly in favor of its admission and thus terminating the Kansas question."

The vote of January 4th against the constitution he declared to be illegal because it was "held after the Territory had been prepared for admission into the Union as a sovereign State, and when no authority existed in the territorial legislature which could possibly destroy its existence or change its character." His own inconsistency was lightly glossed over.

"For my own part, when I instructed Governor Walker in general terms, in favor of submitting the constitution to the people, I had no object in view except the all-absorbing question of slavery. . . . I then believed, and still believe, that under the organic act the Kansas convention were bound to submit this all-important question of slavery to the people. It was never, however, my opinion that independently of this act they would have been bound to submit any portion of the constitution to a popular vote, in order to give it validity."

To the public at large, the central point of interest in this special message, however, was the following dogmatic announcement by the President:

"It has been solemnly adjudged by the highest judicial tribunal known to our laws that slavery exists in Kansas by virtue of the Constitution of the United States. Kansas is, therefore, at this moment as much a slave State as Georgia or South Carolina. Without this, the equality of the sovereign States composing the Union would be violated, and the use and enjoyment of a territory acquired by the common treasure of all the States would be closed against the people and the property of nearly half the members of the Confederacy. Slavery can, therefore, never be prohibited in Kansas except by means of a constitutional provision, and in no other manner can this be obtained so promptly, if a majority of the people desire it, as by admitting it into the Union under its present constitution."

In the light of subsequent history this extreme pro-slavery programme was not only wrong in morals and statesmanship, but short-sighted and fool-hardy as a party policy. But to the eyes of President Buchanan this latter view was not so plain. The country was apparently in the full tide of a pro-slavery reaction. He had not only been elected President, but the Democratic party had also re-

* Douglas, Senate Speech, Dec. 9th, 1857.

covered its control of Congress. The presiding officer of each branch was a Southerner. One of 64 members of the Senate, 39 were Democrats, 20 Republicans, and 5 Americans. Of the 237 members of the House, 131 were Democrats, 92 Republicans, and 14 Americans. Here was a clear majority of 14 in the upper and 25 in the lower House. This was indeed no longer the formidable legislative power which repeated the Missouri Compromise, but it seemed perhaps a sufficient force to carry out the President's recommendation. His error was in forgetting that this apparent popular endorsement was secured to him and his party by means of the double construction placed upon the Nebraska bill and the Cincinnati platform, by the caucus bargain between the leaders of the South and the leaders of the North. The moment had come when this unnatural alliance needed to be exposed and in part repudiated.

The haste with which the Southern leaders advanced step by step, forced every issue, and were now pushing their allies to the wall was, to say the best, bad management, but it grew logically out of their situation. They were swimming against the stream. The leading forces of civilization, population, wealth, commerce, intelligence, were bearing them down. The balance of power was lost. Already there were 16 free States to 15 slave States. Minnesota and Oregon, inevitably destined also to become free, were applying for admission to the Union.

Still, the case of the South was not hopeless. Kansas was apparently within their grasp. Existing law provided for the formation and admission of four additional States to be carved out of Texas, which would certainly become slave States. Then there remained the possible division of California, and a race for the possession of New Mexico and Arizona. Behind all, or, more likely, before all except Kansas, in the order of desired events, was the darling ambition of President Buchanan, the annexation of Cuba. As United States Minister to England, he had publicly declared, that if Spain refused to sell us that covered island, we should be justified in wresting it from her by force;* as presidential candidate he had confidentially avowed, amid the first blushes of his new honor, "If I can be instrumental in settling the slavery question upon the terms I have mentioned, and then add Cuba to the Union, I shall, if President, be willing to give up the ghost, and let Breckinridge take the government."† Thus,

even excluding the more problematical chances which lay hidden in filibustering enterprises, there was a possibility, easily demonstrable to the sanguine, that a decade or two might change mere numerical preponderance from the free to the slave States. Nor could this possibility be waved aside by any affectation of incredulity. Not alone Mr. Buchanan, but the whole Democratic party was publicly pledged to annexation. "Resolved," said the Cincinnati platform, "that the Democratic party will expect of the next Administration that every proper effort will be made to insure our ascendancy in the Gulf of

LIFE-MASK OF STEPHEN A. DOUGLAS, TAKEN BY

Mexico"; while another resolution declaring sympathy with efforts to "regenerate" Central America was no less significant.‡

But to accomplish such marvels, they must not sit with folded hands. The price of slavery was fearless aggression. They must build on a deeper foundation than presidential elections, party majorities, or even than votes in the Senate. The theory of the government must be reversed, the philosophy of the republic interpreted anew. In this subtler effort they had made notable progress. By the Kansas-Nebraska act they had paralyzed the legislation of half a century. By the Dred Scott decision they had changed the Constitution and blighted the Declaration of Independence. By the Lecompton trick they would show that

STEPHEN A. DOUGLAS.

in conflict with their dogmas the public will was vicious, and in conflict with their intrigues the majority powerless. They had the President, the Cabinet, the Senate, the House, the Supreme Court, and, by no means least in the immediate problem, John Calhoun with his technical investiture of far-reaching authority. The country had recovered from the shock of the repeal of the Missouri Compromise, and rewarded them with Buchanan. Would it not equally recover from the shock of the Lecompton constitution?

It was precisely at this point that the bent bow broke. The great bulk of the Democratic

party followed the President and his Southern advisers, even in this extreme step; but to a minority sufficient to turn the scale, the Lecompton scandal had become too offensive for further tolerance.

• In the Senate, with its heavy Democratic majority, the Administration easily secured the passage of a bill to admit Kansas with the Lecompton constitution. Out of eleven Democratic Senators from free States, only three — Douglas of Illinois, Broderick of California, and Stuart of Michigan — took courage to speak and vote against the measure. In the House of Representatives, however, with a narrower

struggle of political power, the scheme, after an exciting discussion running through about four months, met a decisive defeat. A formidable popular opposition to it had developed in the North, in which speeches and letters from Governor Walker and Secretary Stanton and publication of it were a leading feature and a powerful influence. The lower House of Congress always responds quickly to currents of popular sentiment; but in this case it caught opinion all the more promptly because its members were to be chosen anew in the ensuing autumn. However much they might have party subordination and success at heart, some of them felt that they could not defend before their antislavery constituencies the Oxford frauds, the Calhoun dictatorship, the theory that slave property is above constitutional sanction, and the dogma that "Kansas is therefore at this moment as much a slave State as Georgia or South Carolina." When the test vote was taken on April 1st, out of the 53 Democratic representatives from the free States 31 voted for Lecompton; but the remaining 22,* joining their strength to the opposition, passed a substitute, originating with Mr. Crittenden of the Senate, which in substance directed a resubmission of the Lecompton constitution to the people of Kansas,—if adopted, the President to admit the new State by a simple proclamation; if rejected, the people to call a convention and frame a new instrument.

As the October vote had been the turning-point in the local popular struggle in the Territory, this adoption of the Crittenden-Montgomery substitute, by a total vote of 120 to 112 in the House of Representatives, was the culmination of the National intrigue to secure Kansas for the South. It was a narrow victory for freedom; a change of 5 votes would have passed the Lecompton bill and admitted the State with slavery, and a constitutional prohibition against any change for seven years to come. With his authority to control election returns, there is every reason to suppose that Calhoun would have set up a pro-slavery State legislature, to choose two pro-slavery senators, whom in its turn the strong Lecompton majority in the United States Senate would have admitted to seats; and thus the whole chain of fraud and usurpation back to the first Border-Ruffian invasion of Kansas would have become complete, legal, and irrevocable, on plea of mere formal and technical regularity.

Foiled in its main object, the Administration made another effort which served to break somewhat the force and humiliation of its first and signal defeat. The two houses of Congress having disagreed as stated, and each having once more voted to adhere to its own action, the President managed to make enough converts among the anti-Lecompton Democrats of the House to secure the appointment of a committee of conference. This committee devised what became popularly known as the "English bill," a measure which tendered a land grant to the new State, and provided that on the following August 3d the people of Kansas might vote "proposition accepted" or "proposition rejected." Acceptance should work the admission of the State with the Lecompton constitution, while rejection should postpone any admission until her population reached the ratio of representation required for a member of the House. "Hence it will be argued," explained Douglas, "in one portion of the Union that this is a submission of the constitution, and in another portion that it is not." The English bill became a law; but the people of Kansas once more voted to reject the "proposition" by nearly ten thousand majority.

Douglas opposed the English bill as he had done the Lecompton bill, thus maintaining his attitude as the chief leader of the anti-Lecompton opposition. In proportion as he received encouragement and commendation from Republican and American newspapers, he fell under the ban of the Administration journals. The "Washington Union" especially pursued him with denunciation. "It has read me out of the Democratic party every other day at least, for two or three months," said he, "and keeps reading me out; and, as if it had not succeeded, still continues to read me out, using such terms as 'traitor,' 'renegade,' 'deserter,' and other kind and polite epithets of that nature." He explained that this arose from his having voted in the Senate against its editor for the office of public printer; but he also pointed out that he did so because that journal had become pro-slavery to the point of declaring "that the emancipation acts of New York, of New England, of Pennsylvania, and of New Jersey were unconstitutional, were outrages upon the right of property, were violations of the Constitution of the United States." "The proposition is advanced," continued he, "that a Southern man has a right to move from South Carolina with his negroes into Illinois, to settle there and hold them there as slaves, anything in the constitution and laws of Illinois to the contrary notwithstanding." Douglas further intimated broadly that the President and Cabinet were inspiring these editorials of the Administration organ, as part

* From California, 1; Illinois, 5; Indiana, 3; New Jersey, 1; New York, 2; Ohio, 6; Pennsylvania, 4.

For Lecompton: California, 1; Connecticut, 2; Indiana, 3; New Jersey, 2; New York, 10; Ohio, 2; Pennsylvania, 11.

and parcel of the same system and object with which they were pushing the Lecompton constitution with its odious "property" doctrine; and declared, "if my protest against this interpolation into the policy of this country or the creed of the Democratic party is to bring me under the ban, I am ready to meet the issue."*

He had not long to wait for the issue. The party rupture was radical, not superficial. It was, as he had himself pointed out, part of the contest for national supremacy between slavery and freedom. From time to time he still held out the olive-branch of an accommodation, and pointed wistfully to the path of reconciliation. But the reactionary faction which ruled Mr. Buchanan never forgave Douglas for his part in defeating Lecompton, and more especially for what they alleged to be his treachery to his caucus bargain, in refusing to accept and defend all the logical consequences of the Dred Scott decision.

THE LINCOLN-DOUGLAS DEBATES.

THE anti-Lecompton recusancy of Douglas baffled the plotting extremists of the South and created additional dissension in the Democratic ranks; and this growing Democratic weakness and the increasing Republican ardor and strength presaged a possible Republican success in the coming Presidential election. While this condition of things gave national politics an unusual interest, the State of Illinois now became the field of a local contest which for the moment held the attention of the entire country in such a degree as to involve and even eclipse national issues.

In this local contest in Illinois, the choice of candidates on both sides was determined long beforehand by a popular feeling, stronger and more unerring than ordinary individual or caucus intrigues. Douglas, as author of the repeal of the Missouri Compromise, as a formidable Presidential aspirant, and now again as leader of the anti-Lecompton Democrats, could, of course, have no rival in his party for his own Senatorial seat. Lincoln, who had in 1854 gracefully yielded his justly won Senatorial honors to Trumbull, and who alone bearded Douglas in his own State throughout the whole anti-Nebraska struggle, with anything like a show of equal political courage and intellectual strength, was as inevitably the leader and choice of the Republicans. Their State convention met in Springfield on the 16th of June, 1858, and, after its ordinary routine work, passed with acclamation a separate resolution, which declared "that Abraham Lincoln is the first and only choice of the Republicans of Illinois for the

United States Senate as the successor of Stephen A. Douglas." The proceedings of the convention had consumed the afternoon, and an adjournment was taken. At 8 o'clock that same evening, the convention having reassembled in the State-house, Lincoln appeared before it, and made what was perhaps the most carefully prepared speech of his whole life. Every word of it was written, every sentence had been tested; but the speaker delivered it without manuscript or notes. It was not an ordinary oration, but, in the main, an argument, as sententious and axiomatic as if made to a bench of jurists. Its opening sentences contained a political prophecy which not only became the groundwork of the campaign, but heralded one of the world's great historical events. He said:

"If we could first know where we are and whither we are tending, we could better judge what to do and how to do it. We are now far into the fifth year since a policy was initiated, with the avowed object and confident promise of putting an end to slavery agitation. Under the operation of that policy, that agitation has not only not ceased, but has constantly augmented. In my opinion it will not cease until a crisis shall have been reached and passed. 'A house divided against itself cannot stand.' I believe this government cannot endure permanently, half slave and half free. I do not expect the Union to be dissolved—I do not expect the house to fall—but I do expect it will cease to be divided. It will become all one thing or all the other. Either the opponents of slavery will arrest the further spread of it, and place it where the public mind shall rest in the belief that it is in course of ultimate extinction; or its advocates will push it forward till it shall become alike lawful in all the States, old as well as new, North as well as South."†

Then followed his demonstration, through the incidents of the Nebraska legislation, the Dred Scott decision, and present political theories and issues, which would by and by find embodiment in new laws and future legal doctrines. The repeal of the Missouri Compromise, the language of the Nebraska bill, which declared slavery "subject to the Constitution," the Dred Scott decision, which declared that "subject to the Constitution" neither Congress nor a territorial legislature could exclude slavery from a Territory,—the argument presented point by point and step by step with legal precision the silent subversion of cherished principles of liberty. "Put this and that together," said he, "and we have another nice little niche, which we may ere long see filled with another Supreme Court decision, declaring that the Constitution of the United States does not permit a State to exclude slavery from its limits. . . . Such a decision is all that slavery now lacks of being alike lawful in all the States. . . . We shall lie down," continued the orator, "pleasantly

* Douglas, Senate Speech, March 22d, 1858.

† Lincoln-Douglas Debates, p. 1.

dreaming that the people of Missouri are on the verge of making their State free; and we shall awake to the reality instead, that the Supreme Court has made Illinois a slave State."

His preparation was a battle-call:

"Our cause then must be intrusted to and conducted by its own undisciplined friends, those whose hands are just above their hearts and in the work, who do care for the result. Ten years ago the Republicans of the nation numbered over a million hundred the usual strong. We did this under the single impulse of resistance to a common danger, with every external circumstance against us. Of course, discontent, and even hostile opinions were gathered from the fair winds, and formed and fought the battle through, under the constant hot breath of a disciplined, proud, and pampered enemy. Did we learn all then to better now? — now, when that same enemy is warring, disaffected, and belligerent? The result is not doubtful. We shall not fail — if we stand true we shall not fail. Wise counsels may accumulate or mistakes delay it, but sooner or later the victory is sure to come."

Lincoln's declaration that the cause of slavery restriction "must be intrusted to its own undisciplined friends" had something more than a general meaning. We have seen that while Douglas avowed he did not care "whether slavery was voted down or voted up" in the Territories, he had opposed the Lecompton constitution on the ground of its non-submission to popular vote, and that this opposition caused the Buchanan Democrats to look upon and treat him as an apostate. Many earnest Republicans were moved to strong sympathy for Douglas in this attitude, partly for his help in defeating the Lecompton inquiry, partly because they believed his action in this particular a prelude to further political repentance, partly out of that chivalric generosity of human nature which sides with the weak against the strong. In the hour of his trial and danger many wishes for his successful reelection came to him from Republicans even of national prominence. Greeley, in the

New York "Tribune" as well as in private letters, made no concealment of such a desire. Burlingame in a fervid speech in the House of Representatives called upon the young men of the country to stand by the Douglas men. It was known that Colfax and other influential members of the House were holding confidential interviews with Douglas, the object of which it was not difficult to guess.* There were even rumors that Seward intended to interfere in his behalf. This report was bruited about so industriously that he felt it necessary to permit a personal friend to write an emphatic denial, so that it might come to Lincoln's knowledge.† On the other hand, newspapers ventured the suggestion that Lincoln might retaliate by a combination against Seward's Presidential aspirations.

Rival politicians in Illinois were suspicious of each other, and did not hesitate to communicate their suspicions to Lincoln.‡ Personal friends, of course, kept him well informed about these various political under-currents, and an interesting letter of his shows that he received and treated the matter with liberal charity.

"I have never said or thought more," wrote he, "as to the inclination of some of our Eastern Republican friends to favor Douglas, than I expressed in your hearing on the evening of the 21st April, at the State Library in this place. I have believed — do believe now — that Greeley, for instance, would be rather pleased to see Douglas reelected over me or any other Republican; and yet I do not believe it is so because of any secret arrangement with Douglas — it is because he thinks Douglas's superior position, reputation, experience, and ability, if you please, would more than compensate for his lack of a pure Republican position, and, therefore, his reelection do the general cause of Republicanism more good than would the election of any one of our better undistinguished pure Republicans. I do not know how you estimate Greeley, but I consider him incapable of corruption or falsehood. He denies that he directly is taking part in favor of Douglas, and I believe him.§ Still his feeling constantly manifests itself in his paper, which, being so

† J. Watson Webb to Bates, June 9th, 1858. MS.

‡ Wentworth to Lincoln, April 19th, 1858. MS.

§ It is interesting to compare with Lincoln's a letter from Greeley to a Chicago editor on the same subject:

"New York, July 24th, 1858.

"My Friend: You have taken your own course — don't try to throw the blame on others. You have rejected Douglas, who might have been conciliated and allowed to do our work, wherever he may now find it necessary to say, or do, or intend of helping us in other States, you have thrown a load upon us that may presently break us down. You know what was the almost universal feeling of the Republicans of other States; and you spurned and insulted them. Now go ahead and fight it through. You are in for it, and it is no good to make us wry faces. What I have said in the 'Tribune' since that got was resolved on, I have been in good faith, intended to help you through. If Lincoln would fight up to the work also, you might get through — if he apologizes, and retreats, he is lost, and all others go down with him. His first Springfield speech (at

the convention) was in the right key; his Chicago speech was bad; and I fear the new Springfield speech is worse. If he dare not stand on broad Republican ground, he cannot stand at all. That, however, is *his* business; he is nowise responsible for what I say. I shall stand on the broad anti-slavery ground, which I have occupied for years. I cannot change it to help your fight; and I should only damage you if I did. You have got your Elephant — you would have him — now shoulder him! He is not so very heavy, after all. As I seem to displease you equally when I try to keep you out of trouble, and when, having rushed in in spite of me, I try to help you in the struggle you have unwisely provoked, I must keep neutral, so far as may be hereafter.

Yours,

(Signed) "HORACE GREELEY.

"J. MEDILL, Esq., Chicago, (very) Ill.

"What have I ever said in favor of 'Negro equality' with reference to your fight? I recollect nothing."

The above is from a manuscript copy of Greeley's letter, and the authors cannot vouch for its literal accuracy, though it bears internal evidence of genuineness.

extensively read in Illinois, is, and will continue to be, a drag upon us. I have also thought that Governor Seward, too, feels about as Greeley does; but not being a newspaper editor, his feeling in this respect is not much manifested. I have no idea that he is, by conversation or by letter, urging Illinois Republicans to vote for Douglas.

"As to myself, let me pledge you my word that neither I nor any friend, so far as I know, has been setting stake against Governor Seward. No combination has been made with me, or proposed to me, in relation to the next presidential candidate. The same thing is true in regard to the next governor of our State. I am not directly or indirectly committed to any one; nor has any one made any advance to me upon the subject. I have had many free conversations with John Wentworth; but he never dropped a remark that led me to suspect that he wishes to be governor. Indeed it is due to truth to say that while he has uniformly expressed himself for me, he has never hinted at any condition. The signs are that we shall have a good convention on the 16th, and I think our prospects generally are improving some every day. I believe we need nothing so much as to get rid of unjust suspicions of one another."*

While many alleged defections were soon disproved by the ready and loyal avowals of his friends in Illinois and elsewhere, there came to him a serious disappointment from a quarter whence he little expected it. Early in the canvass Lincoln began to hear that Crittenden of Kentucky favored the reelection of Douglas, and had promised so to advise the Whigs of Illinois by a public letter. Deeming it well-nigh incredible that a Kentucky Whig like Crittenden could take such a part against an Illinois Whig of his own standing and service, to help a life-long opponent of Clay and his cherished plans, Lincoln addressed him a private letter making the direct inquiry. "I do not believe the story," he wrote, "but still it gives me some uneasiness. If such was your inclination, I do not believe you would so express yourself. It is not in character with you as I have always estimated you."† Crittenden's reply, however, confirmed his worst fears. He said he and Douglas had acted together to oppose Lecompton. For this Douglas had been assailed, and he thought his reelection was necessary to rebuke the Buchanan administration.‡ In addition Crittenden also soon wrote the expected letter for publication, in which phraseology of apparent fairness covered an urgent appeal in Douglas's behalf.§

In the evenly balanced and sensitive condition of Illinois politics this ungracious outside interference may be said to have insured Lincoln's defeat. While it gave him pain to be thus wounded in the house of his friends, he yet more deeply deplored the inexcusable

blunder of weak and blind leaders whose misplaced sympathy put in jeopardy the success of a vital political principle. In his convention speech he had forcibly stated the error and danger of such a step.

"How can he [Douglas] oppose the advances of slavery? He don't care anything about it. His avowed mission is impressing the 'public heart' to care nothing about it. . . . For years he has labored to prove it a sacred right of white men to take negro slaves into the new Territories. Can he possibly show that it is less a sacred right to buy them where they can be bought cheapest? And unquestionably they can be bought cheaper in Africa than in Virginia. He has done all in his power to reduce the whole question of slavery to one of a mere right of property. . . . Now as ever, I wish not to misrepresent Judge Douglas's position, question his motives, or do aught that can be personally offensive to him. Whenever, if ever, he and we can come together on principle so that our great cause may have assistance from his great ability, I hope to have interposed no adventitious obstacle. But clearly he is not now with us—he does not pretend to be—he does not promise ever to be."||

Lincoln in no wise underrated the severity of the political contest in which he was about to engage. He knew his opponent's strong points as well as his weak ones—his energy, his adroitness, the blind devotion of his followers, his greater political fame.

"Senator Douglas is of world-wide renown," he said. "All the anxious politicians of his party, or who have been of his party for years past, have been looking upon him as certainly at no distant day to be the President of the United States. They have seen in his round, jolly, fruitful face post-offices, land-offices, marshalships, and cabinet appointments, *chargé-ships* and foreign missions, bursting and sprouting out in wonderful exuberance ready to be laid hold of by their greedy hands. And as they have been gazing upon this attractive picture so long, they cannot, in the little distraction that has taken place in the party, bring themselves to give up the charming hope; but with greedier anxiety they rush about him, sustain him, and give him marches, triumphal entries, and receptions, beyond what even in the days of his highest prosperity they could have brought about in his favor. On the contrary, nobody has ever expected me to be President. In my poor, lean, lank face, nobody has ever seen that any cabbages were sprouting out. These are disadvantages all taken together, that the Republicans labor under. We have to fight this battle upon principle, and upon principle alone."¶

Douglas and his friends had indeed entered upon the canvass with an unusual flourish of trumpets. Music, banners, salutes, fireworks, addresses, ovation, and jubilation with enthusiasm genuine and simulated, came and went in almost uninterrupted sequence; so much of the noise and pomp of electioneering had not been seen since the famous hard-cider campaign of Harrison. The "Little Giant," as he was proudly nicknamed by his adherents, arrived

¶ Lincoln, Springfield Speech, July 17th, 1858. Debates, p. 55.

in Illinois near midsummer, after elaborate preparation and heralding, and made speeches successively at Chicago, Bloomington, and Springfield on the 9th, 10th, and 17th of July. The Republicans and their candidate were equally alert to contest every inch of ground. Mr. Lincoln made speeches in reply at Chicago on the 10th and at Springfield on the evening of Douglas's day address; and in both instances with such force and success as foreshadowed a fluctuating and long-continued struggle.

For the moment the personal presence of Douglas not only gave spirit and fresh industry to his followers, but the novelty impressed the indifferent and the wavering. The rush of the campaign was substituting excitement for inquiry, blare of brass bands and smoke of gunpowder for intelligent criticism. The fame and prestige of the "Little Giant" was beginning to incline the vibrating scale. Lincoln and his intimate and political advisers were not slow to note the sign of danger; and the remedy devised threw upon him the burden of a new responsibility. It was decided in the councils of the Republican leaders that Lincoln should challenge Douglas to joint public debate.

There is no need to reproduce here the challenge sent by Lincoln on July 24th and the correspondence in which Douglas proposed that they should meet at the towns of Ottawa, Freeport, Jonesborough, Charleston, Galesburg, Quincy, and Alton, each speaker alternately to open and close the discussion; Douglas to speak one hour at Ottawa, Lincoln to reply for an hour and a half, and Douglas to make a half hour's rejoinder. In like manner Lincoln should open and close at Freeport, and so on alternately. Lincoln's note of July 31st accepts the proposal as made. "Although by the terms," he writes, "as you propose, you take four openings and closes to my three, I accede and thus close the arrangement." Meanwhile each of the speakers made independent appointments for other days and places than these seven; and in the heat and dust of midsummer traveled and addressed the people for a period of about one hundred days, frequently making the necessary journeys by night, and often making two and sometimes even three speeches in a single day. To the combat of intellectual skill was thus added an ordeal of physical endurance.*

Lincoln entered upon the task which his party friends had devised with neither bravado nor misgiving. He had not sought these public discussions; neither did he shrink from them. Throughout his whole life he appears

to have been singularly correct in his estimate of difficulties to be encountered and of his own powers for undertaking them. Each of these seven meetings, comprising both the Republican and Democratic voters of the neighboring counties, formed a vast, eager, and attentive assemblage. It needed only the first day's experience to show the wisdom of the Republican leaders in forcing a joint discussion upon Douglas. Face to face with his competitor, he could no longer successfully assume airs of superiority, or wrap himself in his Senatorial dignity and prestige. They were equal spokesmen, of equal parties, on an equal platform, while applause and encouragement on one side balanced applause and encouragement on the other.

In a merely forensic sense, it was indeed a battle of giants. In the whole field of American politics no man has equaled Douglas in the expedients and strategy of debate. Lacking originality and constructive logic, he had great facility in appropriating by ingenious restatement the thoughts and formulas of others. He was tireless, ubiquitous, unseizable. It would have been as easy to hold a globule of mercury under the finger's tip as to fasten him to a point he desired to evade. He could almost invert a proposition by a plausible paraphrase. He delighted in enlarging an opponent's assertion to a forced inference ridiculous in form and monstrous in dimensions. In spirit he was alert, combative, aggressive; in manner, patronizing and arrogant by turns.

Lincoln's mental equipment was of an entirely different order. His principal weapon was direct, unswerving logic. His fairness of statement and generosity of admission had long been proverbial. For these intellectual duels with Douglas, he possessed a power of analysis that easily outran and circumvented the "Little Giant's" most extraordinary gymnastics of argument. But, disdaining mere quibbles, he pursued lines of concise reasoning to maxims of constitutional law and political morals. If we may borrow a comparison from the combats of the Roman arena, Douglas was a gladiator who fought with the net and trident of party catchwords, while Lincoln carried the helmet, sword, and buckler of logic and principle. Both speakers used plain words and pithy sentences. Platitude and declamation could not have held the crowds that listened to them hour after hour in sun and rain. Douglas was always forcible in statement and bold in assertion; but Lincoln was his superior in quaint originality, aptness of phrase, and subtlety of

* "Last year in the Illinois canvass I made just 130 speeches."—[Douglas, Wooster (O.) Speech.] This

was between July 9th and November 2d, 1858, just one hundred days, exclusive of Sundays.

definition; and oftentimes Lincoln's philosophic vision and poetical fervor raised him to flights of eloquence which were not possible to the fiber and temper of his opponent

It is, of course, out of the question to abridge the various Lincoln-Douglas discussions of which the text fills a good-sized volume. Only a few points of controversy may be stated. Lincoln's convention speech, it will be remembered, declared that in his belief the Union could not endure permanently half slave and half free, but must become all one thing or all the other. Douglas in his first speech of the campaign attacked this as an invitation to a war of sections, declaring that uniformity would lead to consolidation and despotism. He charged the Republicans with intent to abolish slavery in the States; said their opposition to the Dred Scott decision was a desire for negro equality and amalgamation; and prescribed his principle of popular sovereignty as a panacea for all the ills growing out of the slavery agitation.

To all this Lincoln replied that Republicans did not aim at abolition in the slave States, but only the exclusion of slavery from free Territories; they did not oppose the Dred Scott decision in so far as it concerned the freedom of Dred Scott, but they refused to accept its dicta as rules of political action. He repelled the accusation that the Republicans desired negro equality or amalgamation, saying:

"There is a physical difference between the two, which, in my judgment, will probably forever forbid their living together upon the footing of perfect equality; and inasmuch as it becomes a necessity that there must be a difference, I, as well as Judge Douglas, am in favor of the race to which I belong having the superior position. I have never said anything to the contrary, but I hold that notwithstanding all this there is no reason in the world why the negro is not entitled to all the natural rights enumerated in the Declaration of Independence,—the right to life, liberty, and the pursuit of happiness. I hold that he is as much entitled to these as the white man. I agree with Judge Douglas he is not my equal in many respects—certainly not in color, perhaps not in moral or intellectual endowment; but in the right to eat the bread without the leave of anybody else, which his own hand earns, he is my equal, and the equal of Judge Douglas and the equal of every living man."*

In return he pressed upon Douglas his charge of a political conspiracy to nationalize slavery, alleging that his "don't care" policy was but the convenient stalking-horse under cover of which a new Dred Scott decision would make slavery lawful everywhere.

"It is merely for the Supreme Court to decide that no State under the Constitution can exclude it, just as they have already decided that under the Constitution

neither Congress nor the territorial legislature can do it. When that is decided and acquiesced in, the whole thing is done. This being true, and this being the way, as I think, that slavery is to be made national, let us consider what Judge Douglas is doing every day to that end. In the first place, let us see what influence he is exerting on public sentiment. In this and like communities public sentiment is everything. With public sentiment, nothing can fail; without it nothing can succeed. Consequently, he who molds public sentiment goes deeper than he who enacts statutes or pronounces decisions. He makes statutes and decisions possible or impossible to be executed."†

"The Democratic policy in regard to that institution will not tolerate the merest breath, the slightest hint, of the least degree of wrong about it. Try it by some of Judge Douglas's arguments. He says he 'don't care whether it is voted up or voted down' in the Territories. I do not care myself, in dealing with that expression, whether it is intended to be expressive of his individual sentiments on the subject, or only of the national policy he desires to have established. It is alike valuable for my purpose. Any man can say that who does not see anything wrong in slavery, but no man can logically say it who does see a wrong in it; because no man can logically say he don't care whether a wrong is voted up or voted down. He may say he don't care whether an indifferent thing is voted up or down, but he must logically have a choice between a right thing and a wrong thing. He contends that whatever community wants slaves has a right to have them. So they have if it is not a wrong. But if it is a wrong, he cannot say people have a right to do wrong. He says that upon the score of equality slaves should be allowed to go into a new Territory, like other property. This is strictly logical if there is no difference between it and other property. If it and other property are equal, his argument is entirely logical. But if you insist that one is wrong and the other right, there is nouse to institute a comparison between right and wrong. You may turn over everything in the Democratic policy from beginning to end, whether in the shape it takes on the statute book, in the shape it takes in the Dred Scott decision, in the shape it takes in conversation, or the shape it takes in short maxim-like arguments—it everywhere carefully excludes the idea that there is anything wrong in it.

"That is the real issue. That is the issue that will continue in this country when these poor tongues of Judge Douglas and myself shall be silent. It is the eternal struggle between these two principles—right and wrong—throughout the world. They are the two principles that have stood face to face from the beginning of time; and will ever continue to struggle. The one is the common right of humanity and the other the divine right of kings. It is the same principle, in whatever shape it develops itself. It is the same spirit that says, 'You work and toil and earn bread, and I'll eat it.' No matter in what shape it comes, whether from the mouth of a king who seeks to bestride the people of his own nation and live by the fruit of their labor, or from one race of men as an apology for enslaving another race, it is the same tyrannical principle."‡

As to the vaunted popular sovereignty principle, Lincoln declared it

"the most arrant quixotism that was ever enacted before a community. . . . Does he mean to say that he has been devoting his life to securing to the people of the Territories the right to exclude slavery from the Territories? If he means so to say, he means to deceive; because he and every one knows that the decision of the Supreme Court, which he approves and makes especial ground of attack upon me for disap-

* Lincoln-Douglas Debates, p. 75.

† Lincoln-Douglas Debates, p. 82.

‡ Lincoln-Douglas Debates, pp. 233-4.

proving, forbids the people of a Territory to exclude slavery. This covers the whole ground from the settlement of a Territory until it reaches the degree of maturity entitling it to form a State constitution. So far as all that ground is concerned, the Judge is not sustaining popular sovereignty, but absolutely opposing it. He sustains the decision which declares that the popular will of the Territories has no constitutional power to exclude slavery during their territorial existence."^{*}

By no means the least interesting of the many points touched in these debates is Lincoln's own estimate of the probable duration of slavery, or rather of the least possible period in which "ultimate extinction" could be effected, even under the most favorable circumstances.

"Now at this day in the history of the world," said he, in the Charleston debate, "we can no more foretell where the end of this slavery agitation will be than we can see the end of the world itself. The Nebraska-Kansas bill was introduced four years and a half ago, and if the agitation is ever to come to an end, we may say we are four years and a half nearer the end. So too we can say we are four years and a half nearer the end of the world; and we can just as clearly see the end of the world as we can see the end of this agitation. The Kansas settlement did not conclude it. If Kansas should sink to-day, and leave a great vacant space in the earth's surface, this vexed question would still be among us. I say then there is no way of putting an end to the slavery agitation amongst us, but to put it back upon the basis where our fathers placed it, no way but to keep it out of our new Territories — to restrict it forever to the old States where it now exists. Then the public mind will rest in the belief that it is in the course of ultimate extinction. That is one way of putting an end to the slavery agitation."

"The other way is for us to surrender and let Judge Douglas and his friends have their way and plant slavery over all the States; cease speaking of it as in any way a wrong; regard slavery as one of the common matters of property and speak of negroes as we do of our horses and cattle. But while it drives on in its state of progress as it is now driving, and as it has driven for the last five years, I have ventured the opinion, and I say to-day, that we will have no end to the slavery agitation until it takes one turn or the other. I do not mean to say that when it takes a turn toward ultimate extinction it will be in a day, nor in a year, nor in two years. I do not suppose that in the most peaceful way ultimate extinction would occur in less than a hundred years at least; but that it will occur in the best way for both races, in God's own good time. I have no doubt."[†]

But the one dominating characteristic of Lincoln's speeches is their constant recurrence to broad and enduring principles, their unremitting effort to lead public opinion to loftier and nobler conceptions of political duty; and nothing in his career stamps him so distinctively an American — "the first American," as Lowell has so happily named him — as his constant eulogy and defense of the philosophical precepts of the Declaration of In-

dependence. The following is one of his indictments of his political opponents on this point:

"At Galesburg the other day, I said, in answer to Judge Douglas, that three years ago there never had been a man, so far as I knew or believed, in the whole world, who had said that the Declaration of Independence did not include negroes in the term 'all men.' I re-assert it to-day. I assert that Judge Douglas and all his friends may search the whole records of the country, and it will be a matter of great astonishment to me if they shall be able to find that one human being three years ago had ever uttered the astounding sentiment that the term 'all men' in the Declaration did not include the negro. Do not let me be misunderstood. I know that more than three years ago there were men who, finding this assertion constantly in the way of their schemes to bring about the ascendancy and perpetuation of slavery, denied the truth of it. I know that Mr. Calhoun and all the politicians of his school denied the truth of the Declaration. I know that it ran along in the mouth of some Southern men for a period of years, ending at last in that shameful though rather forcible declaration of Pettit of Indiana, upon the floor of the United States Senate, that the Declaration of Independence was in that respect 'a self-evident lie' rather than a self-evident truth. But I say, with a perfect knowledge of all this hawking at the Declaration without directly attacking it, that three years ago there never had lived a man who had ventured to assail it in the sneaking way of pretending to believe it and then asserting it did not include the negro. I believe the first man who ever said it was Chief-Justice Taney in the Dred Scott case, and the next to him was our friend, Stephen A. Douglas. And now it has become the catch-word of the entire party. I would like to call upon his friends everywhere to consider how they have come in so short a time to view this matter in a way so entirely different from their former belief! to ask whether they are not being borne along by an irresistible current, whither they know not?"[‡]

In the joint debates, however, argument and oratory were both necessarily hampered by the inexorable limit of time. For the full development of his thought, the speeches Lincoln made separately at other places afforded him a freer opportunity. A quotation from his language on one of these occasions is therefore here added, as a better illustration of his style and logic, where his sublime theme carried him into one of his more impassioned moods:

"The Declaration of Independence was formed by the representatives of American liberty from thirteen States of the Confederacy, twelve of which were slave-holding communities. We need not discuss the way or the reason of their becoming slave-holding communities. It is sufficient for our purpose that all of them greatly deplored the evil and that they placed a provision in the Constitution which they supposed would gradually remove the disease by cutting off its source. This was the abolition of the slave trade. So general was the conviction, the public determination, to abolish the African slave trade, that the provision which I have referred to as being placed in the Constitution declared that it should not be abolished prior to the year 1808. A constitutional provision was necessary to prevent the people, through Congress, from putting a stop to the traffic immediately at the close of the war. Now if slavery had been a good thing, would the Fathers

^{*} Lincoln-Douglas Debates, p. 56.

[†] Lincoln-Douglas Debates, p. 157.

[‡] Lincoln-Douglas Debates, p. 225.

of the Republic have taken a step calculated to diminish its beneficent influences among themselves, and snatch the boon wholly from their posterity? These communities, by their representatives in old Independence Hall, said to the whole world of men: 'We hold these truths to be self-evident: that all men are created equal; that they are endowed by their Creator with certain inalienable rights; that among these are life, liberty, and the pursuit of happiness.' This was their majestic interpretation of the economy of the Universe. This was their lofty, and wise, and noble understanding of the justice of the Creator to his creatures. Yes, gentlemen, to all his creatures, to the whole great family of man. In their enlightened belief, nothing stamped with the Divine image and likeness was sent into the world to be trodden on and degraded, and imbruted by its fellows. They grasped not only the whole race of man then living, but they reached forward and seized upon the farthest posterity. They erected a beacon to guide their children, and their children's children, and the countless myriads who should inhabit the earth in other ages. Wise statesmen as they were, they knew the tendency of prosperity to breed tyrants, and so they established these great self-evident truths, that when in the distant future some man, some faction, some interest, should set up the doctrine that none but rich men, or none but white men, or none but Anglo-Saxon white men, were entitled to life, liberty, and the pursuit of happiness, their posterity might look up again to the Declaration of Independence and take courage to renew the battle which their fathers began, so that truth and justice and mercy and all the humane and Christian virtues might not be extinguished from the land; so that no man would hereafter dare to limit and circumscribe the great principles on which the temple of liberty was being built.

"Now, my countrymen, if you have been taught doctrines conflicting with the great landmarks of the Declaration of Independence; if you have listened to suggestions which would take away from its grandeur and mutilate the fair symmetry of its proportions; if you have been inclined to believe that all men are not created equal in those inalienable rights enumerated by our chart of liberty, let me entreat you to come back. Return to the fountain whose waters spring close by the blood of the Revolution. Think nothing of me — take no thought for the political fate of any man whomsoever — but come back to the truths that are in the Declaration of Independence. You may do anything with me you choose, if you will but heed these sacred principles. You may not only defeat me for the Senate, but you may take me and put me to death. While pretending no indifference to earthly honors, I do claim to be actuated in this contest by something higher than an anxiety for office. I charge you to drop every paltry and insignificant thought for

any man's success. It is nothing; I am nothing; Judge Douglas is nothing. But do not destroy that immortal emblem of Humanity — the Declaration of American Independence." *

THE FREEPORT DOCTRINE.

WHAT has been thus far quoted has been less to illustrate the leading lines of discussion, than to explain more fully the main historical incident of the debates. In the first joint discussion at Ottawa, in the northern or anti-slavery part of Illinois, Douglas read a series of strong antislavery resolutions which he erroneously alleged Lincoln had taken part in framing and passing. He said:

"My object in reading these resolutions was to put the question to Abraham Lincoln this day whether he now stands and will stand by each article in that creed and carry it out. . . . I ask Abraham Lincoln these questions † in order that when I trot him down to lower Egypt ‡ I may put the same questions to him." §

In preparing a powerful appeal to local prejudice, Douglas doubtless knew he was handling a two-edged sword; but we shall see that he little appreciated the skill with which his antagonist would wield the weapon he was placing in his hands.

At their second joint meeting at Freeport, also in northern Illinois, Lincoln, who now had the opening speech, said, referring to Douglas's speech at Ottawa:

"I do him no injustice in saying that he occupied at least half of his reply in dealing with me as though I had refused to answer his interrogatories. I now propose that I will answer any of the interrogatories, upon condition that he will answer questions from me not exceeding the same number. I give him an opportunity to respond. The judge remains silent. I now say that I will answer his interrogatories, whether he answers mine or not; and that after I have done so, I shall propound mine to him." ||

Lincoln then read his answers to the seven questions which had been asked him, and proposed four in return, the second one of

† DOUGLAS'S QUESTIONS AND LINCOLN'S ANSWERS.

"Question 1. 'I desire to know whether Lincoln to-day stands, as he did in 1854, in favor of the unconditional repeal of the fugitive-slave law.'

Answer. I do not now, nor ever did, stand in favor of the unconditional repeal of the fugitive-slave law.

Q. 2. 'I desire him to answer whether he stands pledged to-day, as he did in 1854, against the admission of any more slave States into the Union even if the people want them.'

A. I do not now, nor ever did, stand pledged against the admission of any more slave States into the Union.

Q. 3. 'I want to know whether he stands pledged against the admission of a new State into the Union with such a constitution as the people of that State may see fit to make.'

A. I do not stand pledged against the admission of a new State into the Union with such a constitution as the people of that State may see fit to make.

Q. 4. 'I want to know whether he stands to-day pledged to the abolition of slavery in the District of Columbia.'

A. I do not stand to-day pledged to the abolition of slavery in the District of Columbia.

Q. 5. 'I desire him to answer whether he stands pledged to the prohibition of the slave trade between the different States.'

which ran as follows: "Can the people of a United States Territory, in any lawful way, against the wish of any citizen of the United States, exclude slavery from its limits, prior to the formation of a State constitution?" *

To comprehend the full force of this interrogatory, the reader must recall the fact that the "popular sovereignty" of the Nebraska bill was couched in vague language, and qualified with the proviso that it was "subject to the Constitution." The caucus which framed this phraseology agreed, as a compromise between Northern and Southern Democrats, that the courts should interpret and define the constitutional limitations, by which all should abide. The Dred Scott decision declared in terms that Congress could not prohibit slavery in Territories nor authorize a territorial legislature to do so. The Dred Scott decision had thus annihilated "popular sovereignty." Would Douglas admit his blunder in law, and his error in statesmanship?

He had already faced and partly evaded this dilemma in his Springfield speech of 1857, but that was a local declaration and occurred before his Lecompton revolt, and the ingenious sophism then put forth had attracted little notice. Since that time things had materially changed. He had opposed Lecompton, become a party recusant, and been declared a party apostate. His Senatorial term was closing, and he had to look to an evenly balanced if not a hostile constituency for reelection. The Buchanan administration was putting forth what feeble strength it had in Illinois to insure his defeat. His Democratic rivals were scrutinizing every word he uttered. He stood before the people to whom he had pledged his word that the voters of Kansas might regulate their own domestic concerns. They would tolerate no juggling nor evasion. There remained no resource but to answer *Yes*, and he could conjure up no justification of such an answer except the hollow subterfuge he had invented the year before.

A. I do not stand pledged to the prohibition of the slave trade between the different States.

Q. 6. "I desire to know whether he stands pledged to prohibit slavery in all the Territories of the United States, north as well as south of the Missouri Compromise line."

A. I am implicitly if not expressly pledged to a belief in the right and duty of Congress to prohibit slavery in all the United States Territories.

Q. 7. "I desire him to answer whether he is opposed to the acquisition of any new territory unless slavery is first prohibited therein."

A. I am not generally opposed to honest acquisition of territory; and, in any given case, I would not oppose such acquisition accordingly as I might think such acquisition would or would not aggravate the slavery question among ourselves."—[Lincoln-Douglas Debates, p. 88.]

Lincoln clearly enough comprehended the dilemma and predicted the expedient of his antagonist. He had framed his questions and submitted them to a consultation of shrewd party friends. This one especially was the subject of anxious deliberation and serious disagreement. Nearly a month before, Lincoln in a private letter accurately foreshadowed Douglas's course on this question. "You shall have hard work to get him directly to the point whether a territorial legislature has or has not the power to exclude slavery. But if you succeed in bringing him to it — though he will be compelled to say it possesses no such power — he will instantly take ground that slavery cannot actually exist in the Territories unless the people desire it, and so give it protection by territorial legislation. If this offends the South, he will let it offend them, as at all events he means to hold on to his chances in Illinois." There is a tradition that on the night preceding this Freeport debate Lincoln was catching a few hours' rest, at a little railroad center named Mendota, to which place the converging trains brought after midnight a number of excited Republican leaders, on their way to attend the great meeting at the neighboring town of Freeport. Notwithstanding the late hour, Mr. Lincoln's bedroom was soon invaded by an improvised caucus, and the ominous question was once more brought under consideration. The whole drift of advice ran against putting the interrogatory to Douglas; but Lincoln persisted in his determination to force him to answer it. Finally his friends in a chorus cried out, "If you do, you can never be Senator." "Gentlemen," replied Lincoln, "I am killing larger game; if Douglas answers, he can never be President, and the battle of 1860 is worth a hundred of this."

When Lincoln had finished his opening speech in the Freeport debate, and Douglas in his reply came to interrogatory number two, which Lincoln had propounded, he answered as follows:

* LINCOLN'S QUESTIONS.

"Question 1. If the people of Kansas shall, by means entirely unobjectionable in all other respects, adopt a State constitution, and ask admission into the Union under it, before they have the requisite number of inhabitants according to the English bill,—some 93,000,—will you vote to admit them?"

Q. 2. Can the people of a United States Territory, in any lawful way, against the wish of any citizen of the United States, exclude slavery from its limits, prior to the formation of a State constitution?

Q. 3. If the Supreme Court of the United States shall decide that States cannot exclude slavery from their limits, are you in favor of acquiescing in, adopting, and following such decision as a rule of political action?

Q. 4. Are you in favor of acquiring additional territory, in disregard of how such acquisition may affect the nation on the slavery question?"—[Lincoln-Douglas Debates, p. 90.]

"The next question propounded to me by Mr. Lincoln is, Can the people of a Territory in any lawful way, against the wish of any citizen of the United States, exclude slavery from their limits, prior to the formation of a State constitution? I answer emphatically, as Mr. Lincoln has heard me answer a hundred times from every stump in Illinois, that in my opinion the people of a Territory can, by lawful means, exclude slavery from their limits, prior to the formation of a State constitution. Mr. Lincoln knew that I had answered that question over and over again. He heard me argue the Nebraska bill on that principle all over the State in 1854, in 1855, and in 1856, and he has no excuse for pretending to be in doubt as to my position on that question. It matters not what way the Supreme Court may hereafter decide as to the abstract question whether slavery may or may not go into a Territory under the Constitution, the people have the lawful means to introduce it or exclude it, as they please, for the reason that slavery cannot exist a day or an hour anywhere, unless it is supported by local police regulations. Those police regulations can only be established by the local legislature, and if the people are opposed to slavery they will elect representatives to that body who will by unfriendly legislation effectually prevent the introduction of it into their midst. If, on the contrary, they are for it, their legislation will favor its extension. Hence, no matter what the decision of the Supreme Court may be on that abstract question, still the right of the people to make a slave Territory or a free Territory is perfect and complete under the Nebraska bill. I hope Mr. Lincoln deems my answer satisfactory on that point."*

The remarkable theory here proposed was immediately taken up and exhaustively discussed by the leading newspapers of all parts of the Union, and thereby became definitely known under the terms "unfriendly legislation" and "Freeport doctrine." Mr. Lincoln effectually disposed of it in the following fashion in the joint debate at Alton:

"I understand I have ten minutes yet. I will employ it in saying something about this argument Judge Douglas uses, while he sustains the Dred Scott decision, that the people of the Territories can still somehow exclude slavery. The first thing I ask attention to is the fact that Judge Douglas constantly said, before the decision, that whether they could or not, was a question for the Supreme Court. But after the court has made the decision he virtually says it is not a question for the Supreme Court, but for the people. And how is it he tells us they can exclude it? He said it needs 'police regulations,' and that admits of 'unfriendly legislation.' Although it is a right established by the Constitution of the United States to take a slave into a Territory of the United States and hold him as property, yet unless the territorial legislature will give friendly legislation, and, more especially, if they adopt unfriendly legislation, they can practically exclude him. Now, without meeting this proposition as a matter of fact, I pass to consider the real constitutional obligation. Let me take the gentleman who looks me in the face before me, and let us suppose that he is a member of the territorial legislature. The first thing he will do will be to swear that he will support the Constitution of the United States. His neighbor by his side in the Territory has slaves and needs territorial legislation to enable him to enjoy that constitutional right. Can he withhold the legislation which his neighbor needs for the enjoyment of a right which is fixed in his favor in the Constitution of the United States, which he has sworn to support? Can he withhold it without violating his oath? and more

especially, can he pass unfriendly legislation to violate his oath? Why this is a monstrous sort of talk about the Constitution of the United States! There has never been so outlandish or lawless a doctrine from the mouth of any respectable man on earth. I do not believe it is a constitutional right to hold slaves in a Territory of the United States. I believe the decision was improperly made, and I go for reversing it. Judge Douglas is furious against those who go for reversing a decision. But he is for legislating it out of all force while the law itself stands. I repeat that there has never been so monstrous a doctrine uttered from the mouth of a respectable man."

The announcement and subsequent defense by Douglas of his "Freeport doctrine" proved, as Lincoln had predicted, something more important than a mere campaign incident. It was the turning-point in Douglas's political fortunes. With the whole South, and with a few prominent politicians of the North, it served to put him outside the pale of party fellowship. Compared with this his Lecompton revolt had been a venial offense. In that case he had merely contended for the machinery of a fair popular vote. This was the avowal of a principle as obnoxious to the slavery propaganda as the unqualified abolitionism of Giddings or Lovejoy. Henceforth all hope of reconciliation, atonement, or chance of Presidential nomination by the united Democratic party was out of the question. Before this, newspaper zealots had indeed denounced him for his Lecompton recusancy as a traitor and renegade, and the Administration had endeavored to secure his defeat; now, however, in addition, the party high-priests put him under solemn ban of excommunication. How they felt and from what motives they acted is stated with singular force and frankness in a Senate speech, soon after the Charleston convention, by Senator J. P. Benjamin of Louisiana, one of the ablest and most persistent of the conspirators to nationalize slavery, and who, not long after, was one of the principal conspirators and actors in the great Rebellion:

"Up to the years 1857 and 1858 no man in this nation had a higher or more exalted opinion of the character, the services, and the political integrity of the senator from Illinois [Douglas] than I had. . . . Sir, it has been with reluctance and sorrow that I have been obliged to pluck down my idol from his place on high, and to refuse to him any more support or confidence as a member of the party. I have done so, I trust, upon no light or unworthy ground. I have not done so alone. The causes that have operated on me have operated on the Democratic party of the United States, and have operated an effect which the whole future life of the Senator will be utterly unable to obliterate. It is impossible that confidence thus lost can be restored. On what ground has that confidence been forfeited, and why is it that we now refuse him our support and fellowship? I have stated our reason to day. I have appealed to the record. I have not followed him back in the false issue or the feigned traverse that he makes in relation to matters that are not now in contest between him and the Democratic party.

* Lincoln-Douglas Debates, p. 95.

† Lincoln-Douglas Debates, p. 234.

The question is not what we all said or believed in 1840 or in 1850. How idle was it to search ancient precedents and accumulate old quotations from what Senators may have at different times said in relation to their principles and views. The precise point, the direct arraignment, the plain and explicit allegation made against the Senator from Illinois is not touched by him in all of his speech.

"We accuse him for this, to wit: that having bargained with us upon a point upon which we were at issue, that it should be considered a judicial point; that he would abide the decision; that he would act under the decision, and consider it a doctrine of the party; that having said that to us here in the Senate, he went home, and under the stress of a local election, his knees gave way; his whole person trembled. His adversary stood upon principle and was beaten; and lo! he is the candidate of a mighty party for the Presidency of the United States. The Senator from Illinois faltered. He got the prize for which he faltered; but lo! the grand prize of his ambition to-day slips from his grasp because of his faltering in his former contest, and his success in the canvass for the Senate, purchased for an ignoble price, has cost him the loss of the Presidency of the United States."*

The Senatorial canvass in Illinois came to a close with the election on the 2d of November and resulted in a victory for Douglas. The Republicans, on their State ticket, polled 125,430 votes; the Douglas Democrats, 121,609; the Buchanan Democrats, 5071. By this plurality the Republican State officers were chosen. But in respect to members of the legislature the case stood differently, and when in the following January the Senatorial election took place in joint session of the two Houses, Douglas received the vote of every Democrat, 54 members, and Lincoln the vote of every Republican, 46 members, whereupon Douglas was declared elected Senator of the United States for 6 years from the 4th of March, 1859.

The main cause of Lincoln's defeat was the unfairness of the existing apportionment, which was based upon the census of 1850. A fair apportionment, based on the changes of population which had occurred, would have given northern Illinois a larger representation; and it was there the Republicans had recruited their principal strength in the recent transformation of parties. The Republicans estimated that this circumstance caused them a loss of 6 to 10 members.

But the unusual political combinations also had a large influence in the result. Lincoln, in an Ohio speech made in the following year, addressing himself to Kentuckians, thus summarized the political forces that contributed to his defeat:

"Douglas had three or four very distinguished men of the most extreme antislavery views of any men in the Republican party expressing their desire for his reelection to the Senate last year. That would of itself have

seemed to be a little wonderful, but that wonder is heightened when we see that Wise of Virginia, a man exactly opposed to them, a man who believes in the divine right of slavery, was also expressing his desire that Douglas should be reelected; that another man that may be said to be kindred to Wise, Mr. Breckinridge, the Vice-President, and of your own State, was also agreeing with the antislavery men in the North, that Douglas ought to be reelected. Still to heighten the wonder, a Senator from Kentucky, whom I have always loved with an affection as tender and endearing as I have ever loved any man, who was opposed to the antislavery men for reasons which seemed sufficient to him and equally opposed to Wise and Breckinridge, was writing letters to Illinois to secure the reelection of Douglas. Now that all these conflicting elements should be brought, while at daggers' points with one another, to support him, is a feat that is worthy for you to note and consider. It is quite probable that each of these classes of men thought, by the reelection of Douglas, their peculiar views would gain something; it is probable that the antislavery men thought their views would gain something; that Wise and Breckinridge thought so too, as regards their opinions; that Mr. Crittenden thought that his views would gain something although he was opposed to both these other men. It is probable that each and all of them thought they were using Douglas, and it is yet an unsolved problem whether he was not using them all."†

After a hundred consecutive days of excitement, of intense mental strain, and of unremitting bodily exertion, after speech-making and parades, music and bonfires, it must be something of a trial to face at once the mortification of defeat, the weariness of intellectual and physical reaction, and the dull commonplace of daily routine. Letters written at this period show that under these conditions Mr. Lincoln remained composed, patient, and hopeful. Two weeks after election he wrote thus to Mr. Judd, a member of the legislature and chairman of the Republican State Central Committee:

"I have the pleasure to inform you that I am convalescent and hoping these lines may find you in the same improving state of health. Doubtless you have suspected for some time that I entertain a personal wish for a term in the United States Senate; and had the suspicion taken the shape of a direct charge I think I could not have truthfully denied it. But let the past as nothing be. For the future my view is that the fight must go on. The returns here are not yet completed, but it is believed that Dougherty's vote will be slightly greater than Miller's majority over Tracy. We have some hundred and twenty thousand clear Republican votes. That pile is worth keeping together. It will elect a State Treasurer two years hence.

"In that day I shall fight in the ranks, but I shall be in no one's way for any of the places. I am especially for Trumbull's reelection; and, by the way, this brings me to the principal object of this letter. Can you not take your draft of an apportionment law and carefully revise it till it shall be strictly and obviously just in all particulars, and then by an early and persistent effort get enough of the enemies' men to enable you to pass it? I believe if you and Peck make a job of it, begin early and work earnestly and quietly, you can succeed in it. Unless something be done, Trumbull is inevitably beaten two years hence. Take this into serious consideration."‡

* Benjamin, Senate Speech, May 22d, 1860.

† Lincoln, Cincinnati Speech, Sept. 17th, 1859. Debates, p. 263.

‡ Lincoln to Judd, Nov. 15th, 1858.

On the following day he received from Mr. Judd a letter informing him that the funds subscribed for the State Central Committee did not suffice to pay all the election bills, and asking his help to raise additional contributions. To this appeal Lincoln replied :

"Yours of the 15th is just received. I wrote you the same day. As to the pecuniary matter, I am willing to pay according to my ability, but I am the poorest hand living to get others to pay. I have been on expenses so long without earning anything that I am absolutely without money now for even household expenses. Still, if you can put in \$250 for me towards discharging the debt of the committee, I will allow it when you and I settle the private matter between us. This, with what I have already paid, and with an outstanding note of mine, will exceed my subscription of \$500. This, too, is exclusive of my ordinary expenses during the campaign, all which being added to my loss of time and business, bears pretty heavily upon one no better off in world's goods than I; but as I had the post of honor, it is not for me to be over-nice. You are feeling badly — 'And this too shall pass away.' 'Never fear.'"

The sting of personal defeat is painful to most men, and it was doubtless so to Lincoln. Yet he regarded the passing struggle as something more than a mere scramble for office, and drew from it the consolation which all earnest workers feel in the consciousness of a task well done. Thus he wrote to a friend on November 19th as follows :

"You doubtless have seen ere this the result of the election here. Of course I wished, but I did not much expect, a better result. . . . I am glad I made the late race. It gave me a hearing on the great and durable question of the age, which I could have had in no other way ; and though I now sink out of view, and shall be forgotten, I believe I have made some marks which will tell for the cause of liberty, long after I am gone."

* Lincoln to Judd, Nov. 16th, 1858.

† Lincoln to Dr. Henry, Nov. 19th, 1858. MS.

‡ Lincoln to Asbury, Nov. 19th, 1858.

NOTE.— In the next number will be given an account of Lincoln's Ohio speeches, his Cooper Institute speech, etc.

To these one other letter may be added, showing his never-failing faith in the political future. To a personal friend in Quincy, Illinois, who had watched the campaign with unusual attention, Lincoln wrote that same day :

"Yours of the 13th was received some days ago. The fight must go on. The cause of civil liberty must not be surrendered at the end of one or even one hundred defeats. Douglas had the ingenuity to be supported in the late contest, both as the best means to break down and to uphold the slave interest. No ingenuity can keep these antagonistic elements in harmony long. Another explosion will soon come."

Douglas was also greatly exhausted by the wearing labors of the campaign ; but he had the notable triumph of an assured reelection to the Senate and the congratulations of his enthusiastic friends to sustain and refresh him. Being an indefatigable worker, he was already organizing a new and more ambitious effort. Three weeks after election he started on a brief tour to the Southern States, making speeches at Memphis and New Orleans, of which further mention will be made in the next chapter. Perhaps he deemed it wise not to proceed immediately to Washington, where Congress convened on the first Monday of December, and thus to avoid a direct continuance of his battle with the Buchanan Administration. If so, the device proved ineffectual. The President and his partisans were determined to put the author of the "Freeport doctrine" under public ban, and to that end, when Congress organized, one of the first acts of the Senate majority was to depose Douglas from his place as chairman of the Committee on Territories, which he had held in that body for eleven years.

LOSS AND GAIN.

If the June rose could guess

Before the sunbeam wooed her from the bud,
And reddened into life her faint young blood,
What blight should fall upon her loveliness,
What darkness of decay, what shroud of snow—
Would the rose ever blow ?

If the wild lark could feel

When first between two worlds he caroled clear,
Voicing the ecstasy of either sphere,
What apathy of song should o'er him steal,
What broken accents and what faltering wing—
Would the lark ever sing ?

Alas, and yet alas,
For glory of existence that shall pass!
For pride of beauty and for strength of song !
Yet were the untried life a deeper wrong.
Better a single throb of being win,
Than never to have been !

Kate Putnam Osgood.

THE POTENTIAL ENERGY OF FOOD.

THE CHEMISTRY AND ECONOMY OF FOOD. III

"Besides the . . . chemical elements, there is, in the physical world, one agent only, and this is called energy. It may appear, according to circumstances, as motion [heat], chemical affinity, cohesion, electricity, light, magnetism, and from any one of these forms it can be transformed into any of the others."—FR. MOHR.

"I have here a bundle of cotton, which I ignite; it burns and yields a definite amount of heat; precisely that amount of heat was abstracted from the sun, in order to form that bit of cotton; . . . every tree, plant, and flower grows and flourishes by the grace and bounty of the sun. But we cannot stop at vegetable life, for this is the source . . . of all animal life. In the animal body vegetable substances are brought again into contact with their beloved oxygen, and they burn within us as a fire burns in a grate. This is the source of all animal power, . . . all terrestrial power is drawn from the sun."—TYNDALL.

"All are but parts of one stupendous whole,
Whose body Nature is, and God the Soul;
That changed thro' all, and yet in all the same,

Lives thro' all life, extends thro' all extent,
Spreads undivided, operates unspent."—POPE.

WITHOUT doubt the two most fruitful ideas which our century has developed are those of evolution and the conservation of energy. The latter principle was, I believe, first clearly and definitely set forth in 1837.* just half a century ago, by Dr. Mohr, in the words quoted above.

During the years since then, the astronomers and geologists and physicists have been learning and explaining to us how the energy, whose primordial source in our solar system is the sun, warms and lights our planet; how it is stored in coal and petroleum and wood; and how it is transformed into the heat of the furnace, the light of the lamp, the mechanical power of steam, or into electricity and then into light or heat or mechanical power again. The same energy from the sun is stored in the protein and fats and carbohydrates of food, and the physiologists to-day are telling us how it is transmuted into the heat that warms our bodies and into strength for our work and thought. The potential energy of food may appear in still other forms;—in light, in certain animals, in the

"light of the fire-fly lamp,"

for instance, and even as electricity, in the animal body.

* In an article in the "Zeitschrift für Physik und verwandte Wissenschaften," a journal published in Vienna. It is an interesting fact that these fifty years of unprecedentedly active and brilliant research have only confirmed, while explaining in detail, the principle thus laid down by a young and comparatively unknown German chemist. And it is a striking illustration of

During the epidemic of strikes in the spring of 1886, a church was being built in this city (Middletown, Conn.). When the brick walls were partly laid, the hod-carriers struck for higher pay. The master mason, a man of resources, let them go and got a steam-engine in their place. The brick and the mortar which had been carried up the ladders by Hibernian muscle were lifted by engine and windlass. The work which had been done through the consumption of meat and potatoes in the one case, was accomplished by the combustion of coal in the other, but the underlying principle was the same in both. In each case there was conversion of one form of energy into another. The food which the hod-carriers ate, and the coal which was burned under the boiler, each contained a certain amount of potential energy. That of the food reappeared in the contractile power of muscle, that of the coal in the expansive power of steam.

Before the invention of matches, blacksmiths used to start their fires with iron heated by hammering. The heating of the iron was a case of the conversion of one form of energy into another. The muscular energy of the blacksmith's arm was transformed into the mechanical energy of the descending hammer; when the hammer struck, the energy was imparted to the iron, where it was transmuted into heat, and the iron became red-hot.

The energy came from the blacksmith's food.

the lack of appreciation with which new ideas are often received, that Dr. Mohr's article, which contained this great generalization of modern science, was refused by "Poggendorff's Annalen," the leading German journal of physical science, before it was published in the Austrian journal above named. Dr. Mohr, it is true, did not prove the theory experimentally.

Just how all the potential energy of the food is disposed of in the body, experimental science has not yet told us. But it is certain that part of it is converted into heat and part into the mechanical energy exerted by the muscles. Some of it may be transformed into electricity. There is no doubt that intellectual activity, also, is somehow dependent upon the consumption of material which the brain has obtained from the food, but just what substances are consumed to produce brain and nerve force, and how much of each is required for a given quantity of intellectual labor, are questions which the chemist's balance and the respiration-apparatus do not answer.

ENERGY AND THE UNITY OF THE UNIVERSE.

THE introductory chapter of a German treatise on cattle-feeding explains the nebular hypothesis, a procedure which is perfectly rational when we consider that the profitable feeding of cattle is simply the economical management of matter and energy in living organisms, and that the nebular theory helps us, better than anything else, to understand how the forms of matter and of force which we have to do with have come to be what they are.

That the materials which compose this solid globe, the waters on its surface, the atmosphere around it, the things that live upon it, the planets with which it courses round the sun, the sun itself, and all the innumerable hosts of heavenly bodies that make up the material universe, are of common origin, is a doctrine familiar to us all. That in this material universe there are two things, and two things only, matter and energy, has come to be another of the accepted dicta of physical science. And current metaphysics goes a step farther and resolves matter itself into manifestations of energy.

It is this energy which pervades the universe. It comes to us in the light of the farthest star, which, though traveling with almost inconceivable rapidity, requires uncounted years for its journey hither. A reserve supply was accumulated in our sun, untold ages ago, and he has given and is constantly giving it to the earth as heat and light. In the geologic past it has accumulated in subterranean stores of coal, and it is now and all the while being used to build up every plant and animal that lives and grows upon the surface of our earth. The coal and wood we burn, our food, the reserve material of our bodies, are, like the sun, our reservoirs of latent energy.

This energy which, transmuted into the expansive power of steam, impels the ship, draws the railway train, turns the wheels of industry;

which, in the telegraph, can "put a girdle round about the earth in forty minutes"; and which so conveniently transports men, their works, and their thoughts from one corner of the world to the other that the nations are all becoming one, is the same which, stored in the grass of the field or in the grain of wheat, gives the ox his strength, the race-horse his swiftness, and man his power of muscle and brain. Such are the grand conceptions which advancing knowledge brings us.

This energy is in the cyclone that devastates the land, as in the cooling zephyr of a summer's eve; it is in the awful rolling of the thunder and in the lightning's flash, as in the rustle of the leaves and the gentle cooing of the dove. It is in the tramping of armed hosts, the roar of artillery, and the carnage of battle, as in the soft caress and tender lullaby with which the mother sings and soothes her babe to sleep.

I often think that the greatest creation of human genius is the medieval cathedral. If this be so, and if the grandest music is that which floats through the cathedral aisles, if the loveliest transformations of the sunbeams are in the dim religious light that enters through its stained glass windows, if the holiest thoughts are those of its worshipers; the power that lifted the stones of the cathedral into their places, the light that reveals its grandeur and its beauty, the thought that planned its architecture and composed its music, the vibrations on which its music floats, the motions and the voices of those who bend

*"en murmurant sous le vent des cantiques
Comme au souffle du nord un peuple de roseaux,"*

and who, in responsive adoration, express the sentiments of its worship, are all, in one way or another, the products of that energy which once existed in space, rested for eons in the central orb of our system, and part of which, coming to us in those things which we designate as food, abides for a time in our own bodies and our own brains, to give us life and power and thought.

Says Professor Tyndall, in speaking of the law of conservation of energy:

"Waves may change to ripples, and ripples to waves, magnitude may be substituted for number, and number for magnitude, asteroids may aggregate to suns, suns may resolve themselves into floræ and faunæ, and floræ and faunæ melt in air, the flux of power is eternally the same. It rolls in music through the ages, and all terrestrial energy, the manifestations of life, as well as the display of phenomena, are but the modulations of its rhythm."

Nor does he exaggerate, I think, in saying further:

"Presented rightly to the mind, the discoveries and generalizations of modern science constitute a poem

more sublime than has ever yet been addressed to the intellect and imagination of man. The natural philosopher of to-day may dwell amid conceptions which baffle those of Milton. So great and grand are they, that in the contemplation of them a certain force of eloquence is requisite to preserve us from bewilderment."

But, after all, this statement of a physical law is only the scientific form of the poetic thought expressed in the words of Pope quoted at the beginning of this chapter. Another poet, and one, it seems to me, whose soul was more exquisitely attuned to the harmonies of Nature than any other, has clothed this sentiment in still finer habiliment of words:

"And I have felt
A presence that disturbs me with the joy
Of elevated thoughts: a sense sublime
Of something far more deeply interfused,
Whose dwelling is the light of setting suns,
And the deep and ocean, and the living air,
And the blue sky, and in the mind of man:
A motion and a spirit, that impels
All thinking things, all objects of all thought,
And rolls through all things."

WORDSWORTH.

What are the relations of this physical energy, whose "flux is eternally the same," to the Supreme Power that "impels all thinking things" and "rolls through all things," and "though changed through all" is "yet in all the same," it is the office of the metaphysician and the theologian rather than the chemist to discuss. But as physicists have found that all the forms of physical energy are really one, and chemists are aspiring to the proof that the different elements of which matter is composed are merely modifications of one primordial form, so I cannot forbear the conception, I might almost say belief, that one day the advance of knowledge will bring men to feel that the ideas thus framed in words by scientist and poet are one, not only with each other, but with the sentiment embodied in the words of an older and grander poet:

"O Lord, how great are thy works! and thy thoughts are very deep. . . . But thou art the same, and thy years shall have no end. . . . Such knowledge is too wonderful for me; it is high, I cannot attain unto it. . . . If I ascend up into heaven, thou art there: if I make my bed in hell, behold, thou art there.

"If I take the wings of the morning, and dwell in the uttermost parts of the sea;

"Even there shall thy hand lead me, and thy right hand shall hold me."

Indeed, unless I wrongly apprehend the tendency of the speculation of our time, it is decidedly in this direction. In a late essay on "Religion, a Retrospect and Prospect,"* Mr. Herbert Spencer tells us that "amid the mysteries which become the more mysterious the more they are thought about, there will remain the one absolute certainty, that we are ever in

presence of an Infinite and Eternal Energy, from which all things proceed." Such leaders of thought as Professors Lotze in Germany and Bowne in this country, and many other metaphysicians with them, teach that the things that we call matter are only forms of action of energy and that this energy is God immanent in the universe. And in his most exhilarating lectures on "The Idea of God," Mr. John Fiske says: "Instead of the force which persists let us speak of the Power which is always and everywhere manifested in phenomena. . . . The everlasting source of phenomena is none other than the infinite Power that makes for righteousness"; and again: "The infinite and eternal Power that is manifested in every pulsation of the universe is none other than the living God."

In adopting these conceptions, then, which do away with the conflict between science and religion by making them one in origin and spirit; which teach us that even in the use of our daily bread we are linked to the Power whom we are taught to pray to give it to us; which help us to understand that without his knowledge, because without his action, not even the sparrow falls to the ground; and which help us to realize that the plainest and homeliest things that concern the welfare of our fellow-creatures are worthy of our most serious study and our profoundest thought; we are only following the current philosophy of the time.

That we do not think of these things every time we eat our bread and meat is very well, but such things are worth thinking of once in a while. If they were not, life would not be worth living. But I am wandering far afield and must come back to my subject.

AMOUNTS OF POTENTIAL ENERGY IN FOOD-MATERIALS.

MODERN physical science has taught how to measure the potential energy in combustible materials. The apparatus used is called a calorimeter, and the energy is measured by the amount of heat produced in burning the substances with oxygen, the equivalent of the heat in terms of mechanical energy being quite definitely known. The amounts of potential energy in different food-materials have been measured in this way.

Chemists and physiologists have thought for a long while that when the food is consumed in the body it must yield the same quantity of energy as when burned in the calorimeter. In both cases it is burned with oxygen, although the process in the body is far less simple than in the calorimeter. A number of years ago, Professor Frankland, of London, determined the heats of combustion of differ-

Turnips	139

These estimates are for the nutritive ingredients in one pound of edible substance free from bone and refuse.

The figures are based upon the quantities of nutrients, protein, fats, and carbohydrates, as shown by a limited number of analyses; and the quantities of energy as indicated by experiments with the calorimeter and respiration-apparatus.

In making these estimates, a gram of protein is assumed to contain 4.1 Calories; a gram of carbohydrates the same, and a gram of fats, 9.3 Calories. The food-materials with the most fat, such as butter and very fat meats, have the most potential energy, while those which have little fat and consist mainly of water, like lean meat, fish, milk, potatoes, and turnips, have but little energy.

These comparisons are for a pound of the whole edible substance of each material, including both water and nutrients. If we were to leave the water out of account and take enough of each to make a pound of actual nutrients, the differences in energy would, of course, be much less.

But even if we were to compare equal weights of actually nutritive material, the differences would still be very wide. Butter and sugar have each very little water; butter is nearly all fat, and sugar is a carbohydrate. The potential energy of butter is more than double that of sugar. Calculated on the dry basis, the vegetable foods, which consist largely of carbohydrates, would have less energy than meats which contain considerable fat.

The potential energy represents simply the fuel-value of the food, and hence is only an incomplete measure of its whole nutritive value. Besides serving as fuel, our food has other uses, one of which is, if possible, still more important, namely, that of forming and repairing the tissues of the body, the parts of the

machine. This latter work is done by the protein, which has comparatively little potential energy. Protein is the chief nutrient of lean meat and fish. These have, therefore, a high nutritive value, although their energy is comparatively small. (See Diagram III. of first article of this series.)

PROFESSOR EDWARD FRANKLAND.

ent food-materials, and his results have since been taken by many chemists and physiolo-

* The previous articles of this series have described the different kinds of nutrients of foods. Myosin (lean) of meat, white of egg, casein (curd) of milk, gluten of wheat, etc., are protein compounds. Fat of meat, butter, and oil of corn and wheat are fats. Starch and sugar are carbohydrates.

Since these German researches are very recent and have not yet been made accessible to English readers, I could hardly expect to be excused if I did not give at least an inkling of the details. Here is Dr. Rubner's summary of some of the main results of several long series of experiments, the descriptions of which occupy several hundred pages.

ISODYNAMIC VALUES FOR ONE HUNDRED PARTS OF FAT.

Nutrient substance.	As determined by direct experiments with animals.	As determined by calorimeter.
Myosin	225	213
Lean meat	243	235
Starch	232	229
Cane sugar	234	237
Grape sugar	256	255

The quantities of the several substances, lean meat, myosin (the chief protein compound of lean meat), starch, etc., are those which were found to yield the same amounts of heat when burned in the calorimeter, or to render the same service as fuel when consumed in the body of the animal, as 100 grams of fat. This explanation of the meaning of the expression "isodynamic values for 100 parts of fat" needs a little qualification to make it perfectly correct, but it is as accurate as I can well make it without going into a discussion too abstruse for the pages of a magazine, and it is really accurate enough for our purpose. The figures mean, then, that the dogs in the respiration-apparatus obtained,

gists as the standard for their fuel-values when they are used for food, although with a certain amount of reserve, because of the lack of proof that the heat generated in the calorimeter is an accurate measure of the energy developed by the same materials in the body. The actual demonstration that this is the case, has been reserved for the refinements of later research.

Within a short time past, feeding-trials with animals in the respiration-apparatus have shown the proportions in which the several classes of nutritive ingredients of food do one another's work in serving as fuel in the body, and more extended experiments, with improved forms of the calorimeter, have given very accurate measurements of the amounts of potential energy in the same materials. The respiration experiments have been made with dogs, in the Physiological Institute in Munich, by Dr. Rubner, who has also made an extended series with the calorimeter. The largest number of the experiments with food-materials in the calorimeter, however, have been conducted by Professor Stohmann, of the University of Leipsic, and his assistants. The results of experiments with the respiration-apparatus and with the calorimeter agree with most remarkable closeness. In supplying the body with fuel, the protein, fats, and carbohydrates* replaced

on the average, as much heat to keep their bodies warm and energy for the work their muscles had to do, from 243 grams of lean meat (*i. e.*, meat enough to furnish 243 grams of nutritive material after the water had been driven out), as they obtained from 100 grams of fat, while 235 grams of the lean meat, burned to equivalent products in the calorimeter, would yield the same amount of heat as the 100 grams of fat. Considering the great difficulties in experimenting with live animals, these two isodynamic values, 243 by the respiration-apparatus and 235 by the calorimeter, agree very closely indeed. But with starch, the results by the two methods, 232 and 229, are still closer, while with ordinary table sugar and grape sugar they are as good as identical.

Taking our ordinary food-materials as they come, and leaving out slight differences due to the differences in digestibility, etc., Dr. Rubner has made the following general estimate of the amounts of energy in one gram of each of the three principal classes of nutrients. The Calorie, which is the unit commonly employed in these calculations, is the amount of heat which would raise the temperature of a kilogram of water one degree centigrade (or a pound of water 4 degrees Fahrenheit). Instead of this unit of heat we may use a unit of mechanical energy, for instance the foot-ton, which is the force that would lift one ton one foot. One Calorie nearly corresponds to 1.53 foot-tons.

POTENTIAL ENERGY IN NUTRIENTS OF FOOD.

	Calories.	Foot-tons.
In one gram of protein	4.1	6.3
In one gram of fats	9.3	14.2
In one gram of carbohydrates	4.1	6.3

These figures mean that when a gram (one twenty-eighth of an ounce) of fat, be it the fat of the food or

each other in almost exact proportion to their heats of combustion. That the living body should thus be proved to use its food with such perfect chemical economy is certainly interesting and important. It is one more fact to add to the long lists that are bringing the functions of life more and more within the domain of ordinary physical and chemical law.

The diagram of "Potential Energy of Food" herewith indicates the amounts of potential energy in different food-materials. The estimates are for one pound of each material; that is to say, for one pound of edible substance, freed from refuse, as for instance, meat without bone or the shell-contents of eggs. It is of course to be understood that the materials vary in composition and that these figures represent averages merely. In fact, both the analyses of the food-materials and the researches upon the potential energy of the nutrients are as yet far too limited in extent to be entirely satisfactory. The diagram is like a map of a new country, based upon the first explorations; in the main correct, but in need of more complete surveys to make it accurate in all its details.

body-fat, is consumed in the body, it will, if its potential energy be all transformed into heat, yield enough to warm a kilogram of water nine and three-tenths degrees of the centigrade thermometer, or, if it be transformed into mechanical energy such as the steam-engine or the muscles use to do their work, it will furnish as much as would raise one ton fourteen and two-tenths feet or fourteen and two-tenths tons one foot. A gram of protein or carbohydrates would yield a little less than half as much energy as a gram of fat. In other words, when we compare the nutrients in respect to their fuel-values, their capacities for yielding heat and mechanical power, an ounce of protein of lean meat or albumen of egg is just about equivalent to an ounce of sugar or starch; and a little over two ounces of either would be required to equal an ounce of the fat of meat or butter or body-fat. The potential energy in the ounce of protein or carbohydrates would, if transformed into heat, suffice to raise the temperature of one hundred and thirteen pounds of water one degree Fahrenheit, while an ounce of fat, if completely burned in the body or in the calorimeter, would yield as much heat as would warm over twice that weight of water one degree.

The calculations of Diagram IV. are based upon the figures just given for the potential energy of each nutrient. The figures used for the quantities of each nutrient in each food-material of Diagram IV. are the same as those on which Diagram III. of the first article of this series is based.

By these calculations, a pound of wheat flour contains as much energy, to be converted into the heat which a laboring man needs to keep his body warm, and muscular strength to do his work, as two pounds of lean beef free from bone, while a pound of very fat pork is equal to over four pounds, and a pound of butter to nearly five pounds of the very lean beef. That is, the quantities of latent energy in lean beef, flour, fat pork, and butter, are to each other as one, two, four, and five.

That these food-materials should differ so greatly in fuel-value may, at first sight, seem a little strange. But when we compare the composition of the very fat and the very lean meat, as shown in Diagram III. of the first article of this series (May CENTURY), the reason becomes clear. The very lean meat consists mostly of water, which has no potential energy, while the very fat meat has extremely little water and is composed mainly of fat, which has more potential energy than any other nutrient. The difference between the very fat meat and the wheat flour is not due so much to difference in their proportions of water, for they have nearly the same, but rather to the fact that flour consists largely of starch, which has relatively little potential energy. Butter and oleomargarine lead all the other materials in their quantities of energy. The fat of butter is slightly inferior in this respect, weight for weight, to the fat of meat, the proportions as found by experiment being as 92 to 94, nearly.

I fear I have not yet made quite clear just what these statements and the figures in the diagram actually mean.

A pound of wheat flour is computed to yield energy equal to 1656 calories or 2534 foot-

SMALL RESPIRATION-APPARATUS IN THE MUNICH PHYSIOLOGICAL INSTITUTE.

This apparatus, which is, in principle, identical with the large apparatus described in the previous article of this series, was devised by Prof. Voit, and is intended for experiments with dogs, geese, and other small animals. Its object is to provide for analysis of the air before and after it has been breathed by the animal, and thus show what products of respiration the animal has imparted to it. The box in which the animal is kept is made of glass. Through this box a constant current of air is drawn and measured by the large meter on the table. A small portion of this, however, is drawn through two of the small meters by which it is measured, and through apparatus on the table by which it is analyzed. Air taken from outside the box is at the same time drawn through the other two small meters and apparatus on the table, and thus measured and analyzed in like manner.

tons. But this of course does not mean that if the pound of flour were made into bread, it would enable our blacksmith, if he should eat it, to lift 2534 tons of iron to a height of one foot, or the hod-carrier to carry a ton of bricks to the height of 2534 feet. He could do only a small fraction of this work with his loaf of bread.

Only a very small proportion of the whole energy of the food is made available for external muscular work, such as the hod-carrier's lifting, the blacksmith's hammering, or other manual labor; the most of it is transformed into heat. A considerable quantity is used for the interior work of the body, breathing, keeping the blood in circulation, digestion, etc., but a large part of this is transformed into heat before it leaves the body. Thus the mechanical energy imparted to the blood by the muscles of the heart is changed to heat by the friction of the blood against the vessels through which it circulates. Indeed, there is an old theory that it is this friction that gives the body its heat.

The heat generated in the body, by the combustion of food and otherwise, is continually given off by radiation. With plenty of clothing we can retain enough to keep ourselves warm even in a cold day. Too much clothing may so interfere with radiation as to make us uncomfortably warm. The amount of heat produced in the body is so large that it has been calculated that, if there were no way for it to escape, there would be enough in an average well-fed man to heat his body to the temperature of boiling water in thirty-six hours.

We have a very familiar illustration of the production of heat along with muscular energy in the heating of our bodies when we exercise our muscles. We cannot transform the energy of our food into muscular force without transmitting part of it into heat at the same time. In the body, indeed, as with the steam-engine, but a small part of the energy of the fuel is transformed into mechanical power for work. But the body is more economical in this respect than the best steam-engine; that is to say, it gets more power for work from the same amount of energy in its fuel. It has been estimated that while the most efficient steam-engines cannot get more than one-eighth of the energy of their fuel in the form of mechanical power, the body can get one-fifth. Some calculations, indeed, make a far more favorable showing for the animal as compared with the machine in respect to economy in the use of fuel for work. Professor von Gohren, as the result of elaborate computations, reckons that

A horse may transform	32 per cent.
An ox " "	43 "
A man " "	53 "

The calorimeter here shown is a late form devised by Prof. Stohmann. Within is a small cylinder, S, in which the substance to be tested is burned, being mixed for this purpose with materials furnishing oxygen. This cylinder is surrounded by a cylindrical cover, and is contained in a larger cylinder, W, holding water. The heat from the burning substance is communicated to the water, and is measured by the rise in temperature as shown by the thermometer. Outside of the cylinder holding the water are two concentric cylinders, A, A, holding air which acts as a non-conductor of the heat. The air-cylinders are surrounded by a larger cylinder containing water, which, in its turn, has a covering of felt, the object being to guard against the influence of changes of temperature of the outer air. The further devices for protecting the interior apparatus from gain or loss of heat, lighting the inner mixture in the inner cylinder and measuring the heat produced by the combustion, need not be described here. The whole apparatus is about eighteen inches wide and a little over three feet high.

of the whole potential energy of his food into energy for mechanical work. More research is needed, however, before entirely satisfactory calculations of this sort can be made.

But to come back to the energy in our hod-carrier's pound of flour. If four-fifths are transformed into heat in his body and only one-fifth into muscular force for work, this would give him 500 foot-tons of muscular energy. But when he climbs the ladder with his hod of bricks he must carry his body and the hod up and down again; the power his muscles use to lift their load is not applied directly but through

a complex system of levers in his limbs, and much of the power is used in other ways; so that the amount of lifting of bricks bears a very small proportion to the total energy of the food.

Just as I am writing this, the last volume of the transactions of the Bavarian Academy of Sciences comes to hand, with a communication from Dr. Rubner, giving account of some new and extremely interesting experiments in this direction. I hope the fact that one object of these articles is to report the latest news from the field of abstract research will excuse at least a brief reference to the main results. The experiments were in continuation of those mentioned above, and, like them, were made with dogs in the respiration-apparatus.

One principle which they bring into clear relief is the remarkable economy with which the animal organism uses its material when the supply is limited, and the positive wastefulness it practices when the food-supply exceeds the demand.

The dogs had very little room to move about inside the apparatus and of course made very little muscular exertion. Hence they needed but little protein to make up for the wear of muscle, and, practically, the main demand of their bodies was for fuel to yield heat to warm their bodies and strength for the very little work their muscles had to do. When they fasted, they consumed the fat and protein from the store in their bodies. How rigidly economical they were in this draft upon their previously accumulated capital was shown in the way that the consumption of fuel was affected by the temperature of the room. The interior temperature of the body remained very nearly the same, at "blood-heat," all the while, as indeed it must, or the dogs would have died. In cold days more heat was radiated from the body than in warm, more was needed to supply its place, and

more material was consumed. When the room was warmer the body burned less fuel. And the quantities consumed marked the changes of temperature with a delicacy almost comparable with that of the thermometer.

When the dogs had just food enough to supply their needs they used it with similar economy. In other words, when the income was equal to the necessary expenditure it was used as sparingly as the sums taken from the capital had been. When the food-supply was made larger, part of the extra material was stored in the body as fat and protein, but at the same time the daily consumption increased. That is to say, when their income was more liberal, they laid part of it by, but at the same time allowed their current expenses to increase. It has been found by numerous experiments that when the nutrients are fed in large excess the body may continue for a time to store away part of the extra material, but after it has accumulated a certain amount it refuses to take on more, and the daily consumption equals the supply even when this involves great waste. With the large income, the body continues for a time to add to its capital, but finally it comes to spend as much as it gets, and in so doing practically throws away what it cannot profitably use.

Dr. Rubner's dogs showed, in still another way, their economy of fuel when the supply was limited, and wastefulness when they had more than they needed. The same animal that adjusted its consumption of fuel so accurately to the temperature of the air as long as the amount did not exceed its need, used it with no apparent regard to the temperature, whether warm or cold, as soon as the supply of food exceeded the necessary demand.*

This all seems very simple and natural. So the laws of nature always do when we have discovered and begin to understand them.

* Physiologists have observed that the consumption of fuel in the body sometimes varies with the temperature and sometimes does not, and have been at a loss to explain the apparent discrepancies in their experimental results. These experiments help toward an explanation. But the interesting point is, not simply that the facts are learned, but that they are learned by studying the subject from the standpoint of the potential energy of the food. Previously, the accounts have, so to speak, been drawn up in terms of protein, carbohydrates, and fats, and the balances have been difficult to calculate and still more difficult to explain. But in the experiments of which I have just been speaking, all the figures were reduced to terms of potential energy of the food and body-substance consumed or stored. The results were calculated in Calories, and the balancing of the accounts was thus made simple, and the explanation plain.

Of course I do not mean to say that we have thus suddenly come upon a complete explanation of the whole subject. This is simply an improvement of methods based on clearer understanding of principles and leading to clearer and more accurate results. It is, in short, the old story of clearing up an old mystery by use

of a new and rational idea. As such, as well as for stronger reasons, it is of interest.

It is so easy to magnify the importance of any new discovery, and so hard to avoid going too far in drawing inferences from it, that I am inclined to put in another word of caution here. For instance, from the experiments above described one would infer that the food-ingredients yield strength for muscular labor in exact proportion to their heats of combustion. But the dogs in the respiration-apparatus performed no muscular work except that inside their bodies for respiration, keeping the blood in circulation, etc., and though we naturally assume that if they had used their muscles for exterior work, such as running or working a treadmill, the muscular energy yielded by the food would have been likewise equal to its potential energy, and though the other known facts make this assumption entirely probable, the experiments do not absolutely prove it. The production of muscular strength is a problem which is still but partly solved. Still I think it is reasonably safe to say that, in general, the foods that have the most potential energy are the ones that yield, not only the most heat to keep the body warm, but also the most strength for muscular work.

THERE are numerous homely, practical ways in which these principles may be applied. I well remember how the sensible and thrifty New England people among whom my boyhood was spent used to talk about "hearty victuals," and how prevalent were the doctrines that "a hard-working man wants real hearty food," and that "children ought to have hearty food, but not too hearty."

With these eminently orthodox tenets the science of nutrition in its newest developments is in fullest accord. But there always used to be an unsatisfactory vagueness about them. I never could make out exactly what were "hearty" foods, and in just what their heartiness consisted. It has since occurred to me that these words express one of the ideas which the unerring sense and instinct of man have wrought out of his long experience, but have waited for science to put into clear and definite form. The synonym with which our science defines this idea is energy. Hearty foods are those in which there is an abundance of potential energy.

The lumbermen in the Maine forests work intensely in the cold and snows of winter and in the icy water in the spring. To endure the severe labor and cold, they must have food to yield a great deal of heat and strength. Beans and fat pork are staple articles of diet with them, and are used in very large quantities. The beans supply protein to make up for the wear and tear of muscle, and they, and more especially the pork, are very rich in energy to be used for warmth and work.

I cannot vouch for the following, which has just struck my eye in a daily paper, but, if it is true, the workmen were sound in their physiology:

"A lot of woodchoppers who worked for Mr. S—— in H—— stopped work the other day, and sent a spokesman to their employer, who said that the men were satisfied with their wages and most other things, but didn't like 'your fresh meat; that's too fancy, and hain't got strength into it.' Mr. S—— gave them salt pork three times a day, and peace at once resumed its sway."

The use of oily and fatty foods in arctic regions is explained by the great potential energy of fat, a pound of which is equal to over two pounds of protein or starch. I have been greatly surprised to see, on looking into the matter, how commonly and largely the fatter kinds of meat are used by men engaged in very hard labor. Men in training for athletic contests, as oarsmen and foot-ball teams, eat large quantities of meat. I have often queried why so much fat beef is used, and especially why mutton is often recommended in preference to beef for training diet. Both the beef and the mutton are rich in protein, which makes muscle. Mutton has the advantage of containing more fat along with the protein, and hence more potential energy. Perhaps this is another case in which experience has led to a practice, the real grounds for which have later been explained by scientific research.

The Germans have, in their vernacular, hit closer to the principle here explained than we. Their scientific expression for energy is *Kraft*. In their folk-tongue the word for nourishing, strength-giving, is *kräftig*. When, as a newcomer, I first looked for a boarding-place in a German city, I was amused at the recurring assurances from would-be hosts and hostesses, that their fare was *kräftig*. With the abundance that crowns even the humble board at home, I had not learned how much that word and the idea it carried could mean in less favored lands.

W. O. Atwater.

CROOKED JOHN.

THE Von Gravens had once been a great family; but reckless living had ruined them. They were large, handsome men, with blue eyes and a distinguished bearing. No end of stories were told in the valley of their bright sayings and their foolhardy deeds. Some of their observations, I regret to say, were not for ears polite. Colonel Von Graven, who, with his son Harold, was now the only bearer of the name, was understood to have been a lady-killer in his day. When his dignity thawed out over a glass of toddy, he had been known to make allusion to his adventures in that line; and when the judge gave him a dig in the ribs and called him a gay old boy, he did not resent it.

VOL. XXXIV.—56.

Harold, the colonel's son, was a regular dare-devil. They called him "the girls' Harold," because he had such a taking way with women. Nobody could hold a candle to him on the dancing-floor; and the colonel rubbed his hands and chuckled when he saw him take to love-making as a duck does to water. Ah, yes, he made havoc in the hearts of the girls in those days—mere lad as he was.

Then it was that one fine day in the spring there was a log-jam in the river. The water rose several feet an hour, and there was a roar in the air as of a hundred chariots. Two men had gone to the bottom in trying to break the jam, and it seemed sure death for the third and the fourth. The cataract thundered below, and the yellow foam flew high over the tree-tops. The

spray blew like a drenching rain into the faces of the thousand people who stood with their hearts in their throats, trembling for their homes. Then in the midst of the terror a cheer went up; nobody knew why. It was a lad of sixteen who came sauntering through the throng. It was the girls who cheered him.

"Harold!" cried they, "Harold! He can break the log-jam! He can save the valley!"

They had scarcely uttered the cry, when the boy had snatched an axe from somebody and run into the middle of the river. With the agility of a squirrel he jumped from log to log, and, enveloped in a cloud of spray, climbed the great heap of lumber at the brink of the cataract which dammed the stream. His quick eye detected in an instant where the log was that held the heap. One, two, three swift strokes — the heap began to creak! He flung the axe away, and bounded with daring leaps in the direction of the shore. But the mass was now moving. He stumbled — fell between two logs; scrambled up again, fell again; and God knows what happened; but in a minute he was pulled out with a boat-hook, unconscious, and hopelessly injured.

They sang his praises for a day, and then forgot him. "Brave Harold, noble Harold," said the young girls; but he was no longer the hero of the balls; he made no more havoc in maiden hearts.

His father sent him to a watering-place in France, traveled with him from Carlsbad to Wiesbaden and from Wiesbaden to the Pyrenees, and wasted the last remnant of his fortune consulting famous physicians; yet Harold was and remained a cripple. It nearly broke the old man's heart when his beautiful boy came home pale and hollow-eyed, and with that misshapen form.

"My poor boy," he would say, in a voice full of yearning pity, holding out his arm to the cripple; and then suddenly, as the boy rushed toward him, he would cry in agony: "Go away from me, child."

It was terrible to Harold to be treated thus by his father. But it was still more terrible when his father was gone and he had not a soul in the world who cared for him. They said in the valley that it was his son's twisted form that killed the colonel. He was never the man he had been from the day he saw the deformity.

When his father was dead, Harold's first thought was to go to America; but when the estate was settled, it was found that the colonel had left just enough to pay for his burial. His son was penniless, and had to stay where he was. He was invited around to dinner by his father's old friends; and the judge and the sheriff occasionally sent him some copying,

just to keep him from starving. Thus he kept on for a year, until he began to perceive that he was wearing out his welcome. His melancholy pleased no one; and he often had to go without his dinner. Hunger then stimulated his wit, and the hungrier he was, the more amusing he grew. He enlarged his acquaintance, and got more dinners. He told stories, and when his stock was exhausted, he invented new ones. People laughed and applauded him, and he cursed himself, and went on inventing. After a while, he grew so accustomed to this life that he made no more plans; his own future ceased to interest him. But deep in his heart smoldered a fire which threatened at times to break forth in flame. He felt a savage desire to fling his glass into the face of his coarse host, who sat there, bent upon debasing him in return for the food he gave him; to jump up on the table and in burning words give vent to his deep contempt for himself and the shallow-hearted, shallow-brained people who presumed to kick and pat him as they would a dog. He yearned to do some tremendous deed, merely to rehabilitate his self-respect. He felt at the bottom of his soul, amid all his self-contempt, a proud sense of superiority to those who degraded him by their galling benefits. Some day, before he died, he might surprise them.

His soul was not crippled, whatever his body might be, and there were great deeds yet slumbering in the Von Graven soul.

Another year slipped by, and Harold still dined and told stories. The stories were mostly about himself; the tremendous things he yearned to do, somehow, fired his fancy, until it seemed as if he had already done them. He began to get a bad name in the valley.

"He lies as fast as a horse trots," said the people.

His stately name seemed no longer to fit him. One mocking nickname after another attached itself to him; and before he was aware of it, he was known throughout the parish as "Crooked John." He resented the name at first, but people only laughed at his wrath, and at last he forgot to be angry. But from that time it seemed as if his head sank deeper down between his shoulders; his brilliant eyes grew dull. Ragged tufts of beard grew unheeded upon his chin. His head seemed to grow bigger in proportion to his frame, and his arms and legs thinner. He looked like an ugly gnome. Every vestige of his boyish beauty was gone. And still, it might happen yet, at the dinner table, when the wine had made him forget his degradation, his fancy was again kindled, and the light of happier days shone in his features. Then people forgot how ugly Crooked John was, and they laughed and

applauded his droll sarcasms and his bold inventions.

"Now tell us, Crooked John," the jovial host would exclaim as the laughter subsided, "how much of that was lies and how much truth." "Half-and-half," Harold would answer; and in violently restraining his anger, he would move his face with strange contortions which provoked fresh bursts of laughter. He was a jolly dog, that Crooked John—ha! ha! ha! there wasn't his beat for fun on this side the mountains.

"Wait," thought Harold bitterly, "my hour will come yet. Wait, and I will show you who I am."

II.

ONE morning in June Harold was walking along the river. The lark was singing, and the sky was steeped in sunshine. The pines perspired, and the smell of resin and fresh leaves drifted through the air. There was rarely any one at the river at this time of day, and Harold loved solitude. He was about to throw himself down under a big pine, when he saw a girl sitting motionless upon a stone, leaning against the trunk of the tree. Her head was thrown a little back, as if she were gazing into the sky; but as he came nearer he saw that she was blind. The sun touched the loose hair at her temples, and made it shine like gold. The hair was of strong growth and richly yellow, and made the delicate face look smaller than it was. It seemed to Harold, as his eyes rested upon her, that she looked as he had imagined the angel did, of whom his mother had told him, who kept watch over him in his childhood. The shy, half-startled look, as she listened to his footsteps, and the little tremor in her voice as she asked, "Who is it?" touched him.

"I am Harold von Graven," he answered quietly; and as she rose to go he added, "I shall not harm you."

She seated herself hesitatingly on the stone, and let her aimless glance wander into space.

"I can't think what has become of grandmother," she said after a while; "she told me to sit here till she came back."

"And won't you allow me to keep you company till she returns?"

She did not answer, but sat again leaning backward with her hands folded in her lap.

"Your voice is pleasant," she said with strange abruptness. "I think you are a good man."

Those words brought the tears into his eyes; they were the first kind words he had heard since his father died. He seated himself at the girl's feet and chatted about the birds, the crops, and the fishing. He learned that she lived with her grandmother in a little cottage

up on the hillside, that her father and mother were dead, and that she had recently come from a neighboring parish.

When finally he rose to leave her, he was lighter hearted than he had ever been since his misfortune. He could scarcely tear himself away from the girl; he lingered, walked a few steps, and returned. Why was his heart so light in her presence? The answer flashed upon him,—it was because she could not see him.

From that time forth he never let a day pass without seeing Helen. Her sweet, placid face with the large sightless eyes followed him like a haunting melody. When terrible thoughts oppressed him and he was tempted to curse his fate, he hastened to her, and the dark thoughts fled before the light of her countenance. When he had expended the last remnant of his self-respect in all sorts of buffoonery to please his exacting patrons, he fled to her as to a haven of refuge. Her smile was like a healing bath. His crushed manhood arose again in the breath of her pure presence. The happy look that suddenly illuminated her features at the sound of his footsteps sent a thrill of joy through him. It was the most precious experience his barren life had afforded him. His bent and crooked form seemed to grow tall and erect the moment he passed her threshold; he held his head high, as it behooved a Von Graven, and spoke with the free and happy daring for which the Von Gravens had been famed. The promise of his youth bloomed into fulfillment; life opened wide and glorious before him, and he marched fearlessly from achievement to achievement, from deed to deed. All the misery and degradation of the present were but as a remote menace, which hung about the horizon, and which he fought back by the warmth and vehemence of his eloquence. But when he passed out into the summer night, it grew dark again within him. He wished that the whole world had been blind, or eternally steeped in darkness.

III.

"WHAT is your highest wish, Helen?" he said to her one day, as they were seated together on the river-bank.

"How can you ask?" she queried in a sweet, hushed voice. "I have but one wish, and that will never be fulfilled."

"What is it?" he asked anxiously.

"It is that I may get my sight back," she answered wistfully. "But do not let us speak of it; it only makes me sad."

"Yes, do let us speak of it. Why do you wish so much to get your sight back?"

A deep blush spread over her neck and face.

"Do not ask me about that, Harold," she whispered hurriedly.

"But I wish to know, Helen," he insisted.

She raised her head and turned her large, sightless eyes toward him.

"It is because I wish to see *you*, Harold," she said with strange solemnity.

The stick which he held in his hand snapped, and the pieces dropped between his knees. For a long while he did not speak. When again he lifted his face, it was ashy pale. His mouth twitched a little before he gained control of it.

"But I might disappoint you, Helen," he began unsteadily; "I might not at all look as you imagine I do. Would it not then be better to remain blind?"

"Oh, you should not tease me so cruelly," she cried. "I know how you look, as well as if I had seen you a thousand times."

"How do I look?" he asked hoarsely.

He was determined to drain the bitter cup to the dregs.

"You are tall and beautiful," she answered, with touching enthusiasm; "you have a reckless fling in your walk, and your hair curls densely about your temples. You have the kind of eyes which win the hearts of the girls, full of light and reckless roguishness. You need not deny it, sir," she went on, with innocent archness, "I sha'n't be jealous; I sha'n't ask how many love-affairs you've had."

Each of her words stabbed him to the very heart; he clenched his teeth to smother a cry of pain. She sat smiling with sweet confidence, absorbed in her happy vision.

"Do you know," she continued, "how I found out how you looked? I did not ask grandmother, because I did not wish to know it all at once; but I wanted to have something to wonder about in my long leisure, something to fill the empty darkness about me; and so I thought out, feature by feature, how you looked. And whenever my fancy stopped, I only said half aloud to myself, 'Harold von Graven,' and there was such a proud ring in the name that my fancy leaped forward again; and I knew at once how a Harold von Graven must look."

He could endure it no longer. His soul, stretched upon the rack, writhed with exquisite pain. With groping hands he seized hold of a low-hanging branch above him and pulled himself up. His limbs seemed numb and dead, and his gait unsteady. A strange irresponsibility, as of beginning intoxication, took possession of him. He moved away; but he did not know where he was going. Thought seemed an intolerable vexation. He was weary — weary unto death.

IV.

FOR a week, perhaps, he did not see her, and when he called the next time, he found

the grandmother alone. He begged her, for God's sake, not to tell Helen of his deformity, or mention his nickname in her presence. The agitation in his manner and the distress in his voice impressed the old woman, and she promised what he asked. She then began to whimper, in her wonted fashion, about the bad times and the hard lot of the poor. "I am a-pegging down hill, sir," said she, looking up from her spinning-wheel; "I shall soon be under the sod. What will there then be for the little lass but the poor-house? If she only had her sight, sir — then she could take care of herself; for she is smart enough, God bless her! and she has uncommon sense. But to be on the parish, — a sensitive thing like her, — it will be misery, sir; it'll be misery."

She gave him a quick, warning glance as Helen entered, and he understood that he was not to allude to the melancholy topic.

The girl was pale, and there was a shyness in her greeting which took him aback.

She blushed and moved her hands nervously. Something new and strange had come between them. The old happy unconcern was gone. The anxiety in her manner, as after a brief talk of indifferent things he rose to go, was pitiful. It was all she could do to hold back her tears; and he heard her sobs and the grandmother's soothing murmur, the moment he was out of the door. He guessed that his hope had come true, and what had once been his happiness became now a burden, an agonizing dilemma. How gladly he would have opened his arms to her and said: "Helen, my darling, I love you." But the very touch of him would have revealed his deception, and she would have shrunk back from him, crying, "Who are you?"

It was his lost, youthful self she loved; it was Harold von Graven, the daring, beautiful lad, — it was not Crooked John. And yet — and yet — could she not learn to love Crooked John? Ah, if it had not been for the beautiful Harold von Graven, perhaps she might have loved Crooked John. If he had only had the courage to say to her: "I lost my health, my strength, my youth to save this valley from destruction. I am a misshapen cripple who has none in the world but you to love. Can you not, in your mercy, give one little grain of love to solace my miserable life?" — if he had had the courage to speak thus, I say, perhaps she would, out of the abundance of her womanly pity, have dropped a tear upon the memory of the beautiful Harold von Graven, and loved Crooked John. But now — it was too late!

But his great, heroic deed, — not the long-forgotten one, but the one he had cherished for the future with defiant tenderness; the one wherewith he meant to shame the paltry crowd

that mocked and humiliated him,— might not that give her a glimpse at the proud Von Graven soul that dwelt in his miserable form; might not that win him the admiration which in a woman's heart nestles so close to her love? This possibility filled his soul, haunting him by day and by night. He was like one eager for martyrdom, spying anxiously for a chance to throw away his life gloriously. For he faced, without quailing, the thought of death as a final vindication; he was quite content to sacrifice his life to his sweet revenge. It occurred to him at times, amid his manifold torturing doubts, that the premeditation of the sacrifice, and its interested motive, robbed it of its sublimity; that, in fact, it was nothing but a kind of exalted vanity. And yet, this deep hunger for praise, for recognition, for love, which gnawed like a sleepless worm at his heart, why was it sordid, why ignoble? No daring ambition invades a narrow, commonplace soul. No feverish craving for greatness disturbs the sluggish repose of a sordid, earth-clogged creature.

Crooked John was poor company at dinner in those days, and the judge complained loudly that he had turned his birthday party into a funeral. He had told solemn stories which had made every one feel depressed. When he left, early in the evening, the judge swore he would give him a piece of his mind the next time he saw him. The fact was, Crooked John felt ill at ease now among the gay feasters. Whenever he met Helen's grandmother carrying bundles of fagots upon her back, he scrutinized her face anxiously to see if it was true, as she said, that Death already had her in his clutch.

"I am a-pegging down hill, sir," was the melancholy refrain of her lamentations; "and when I am dead, sir, there is nothing for the little lass but the poor-house."

This thought of Helen in the poor-house—the shy, delicate girl in that miserable house, surrounded by coarse and degraded creatures—was potent enough to divert his mind from his own troubles. He pondered and pondered, and only involved himself in a perplexing maze of doubts and conflicting sentiments. He quite forgot about his heroic deed in his anxiety for Helen. He must save her—yes, he must save her from a doom that would be worse than death. If she were only not so helpless; if she could only see! *If she could see!* But who knew whether her blindness was incurable? He sprang up from his bed and began wildly to pace the floor of his narrow room, as this idea struck him, that Helen might regain her sight. The next morning he walked eleven miles to the county physician and begged him, as if by chance, and without mentioning his name, to examine Helen's eyes. He waited breathlessly for the result down at the river-bank. When, at

the end of half an hour, the physician emerged from the hut, Crooked John anxiously scanned his features.

"Will she see?" he cried; "will she see?"

"That depends," answered the doctor. "The disease is in the retina. The nerve is sound. An operation might restore her sight."

"And can you perform that operation?"

"No, I should not like to risk it. There is but one man in Norway who could do it—Professor L——, in Christiania."

"But how can we get him here?"

"Money will bring him here. If you wish, I will write him about the case."

"Money? How much?"

"Perhaps a hundred dollars."

"A hundred dollars!"

Crooked John dropped down upon a stone and gazed hopelessly out over the river. A hundred dollars! How could a poor sick weakling ever hope to earn a hundred dollars? He got five cents a sheet from the judge for his copying. How long would it take him at that rate to make a hundred dollars? He cut a piece of birch-bark from a tree and began to reckon. He covered it all over with figures, and quite forgot about the doctor's presence.

"Two years," he murmured sadly, raising his eyes from the birch-bark; "two years."

V.

FOR two years people scarcely saw Crooked John. He called upon Helen yet, but not as often as before. Some said he was ill; others, that he had gone mad. Yet late at night Crooked John might have been seen hurrying breathlessly along the highway with large rolls of paper under his arms. He wrote late and early, night and day. Not only from the judge did he procure copying, but from the new colonel and the sheriff. He looked gaunt and haggard; his cheeks were yellowish pale and sunken. The writer's cramp tortured him until his right arm was almost paralyzed. Then he practiced for a long while, and learned to write with his left hand. He lived much of the time in a half-dazed condition, working on indefatigably, and only conscious of one purpose,—to have Helen's sight restored, to save her from the poor-house. Every penny he earned he hoarded up with a miser's glee, and pulled out the bag every night from his mattress, sewing it up carefully again after having counted his gains. He begrudged himself the little that he needed to keep body and soul together, and was content, as long as hunger did not disable him before he had finished his work.

One night—it was about two years after his last meeting with Crooked John—the doctor was sitting in his study. There was a sound

of footsteps in the hall,—shuffling, uncertain footsteps,—and a wary hand seemed to be groping for the door-knob. The doctor arose and opened the door. “Ah, Crooked John!” said he, in amazement. “You out so late at night, Crooked John?”

Crooked John stood panting at the door. It was some time before he was able to speak. He held his hands tightly clasped under his chest, as if they were guarding something precious that was hidden there. “Sit down,” said the doctor, pushing him gently into a chair; “you are ill, I see; you wish to consult me.”

“No—no,” answered Crooked John, with a bewildered look; “I am not ill.”

“What then can I do for you?” asked the doctor.

The cripple, casting anxious glances about the room, began to unbutton his coat and waistcoat. He took out a big bag, and put it on the table before the doctor.

“Count that,” he said, undoing the string, and taking up a handful of copper and silver money. “It is a hundred dollars.”

“But what am I to do with it? You don’t owe me anything.”

“You said it would cost a hundred dollars.”

“What would cost a hundred dollars?”

“To give Helen her sight back.”

The doctor stood speechless; then he grasped the cripple’s hand and pressed it warmly.

“Mr. Von Graven,” he said, “I bow myself in the dust before you.”

IN about a week the famous professor came. Crooked John had planned to stand outside and peep in through the window, so as to get the first glimpse of Helen’s face when she should open her eyes upon the daylight. He had found courage to face the thought that he must vanish from her life. But one parting glimpse he must have of her sweet face, radiant with happiness, as she emerged into the sunlight from her long night. This must be the reward of his labor. He had seen the picture in the old family Bible of Christ restoring the sight of the blind, and he imagined the professor did it in very much the same way. As it happened, however, on the day when the operation was to take place, he was too ill to leave his bed. A fever was raging in his veins. His strength seemed utterly exhausted. The old peasant woman in whose house he lived made tea out of medicinal herbs and gave it to him. But she could not still the raging intensity of thought that like a maelstrom whirled within his brain. The magnitude of his sacrifice began to show upon him. In restoring the light to Helen, he had quenched the light of his own life. What would existence be to him without

her? A long groping through dusky solitudes, with the cold breath of Death in his face. The ideal of him which she loved—how could he have the heart to destroy it? How could he ever walk up to her, ugly and misshapen as he was, and say: “I am the one whom you love—I am Harold von Graven!” Would she believe him? Would she not rather turn away from him with loathing? And could he survive her disgust—would he not sink into the earth before her look of scorn? From the depth of his woe he cried out to God, praying for death. But the torturing thoughts returned and returned, and neither threat nor prayer would keep them away. He saw himself standing before her, in the glory of youth and strength, wooing her, and accepting with manly happiness her willing surrender. But behind this beautiful youth stood a crooked little dwarf who pushed himself forward and said to Helen: “This man, Harold von Graven is dead—can you not love his brother, Crooked John?” But Helen always said: “If he is dead, then I will love him dead, as I loved him living.” And the dwarf, Crooked John, stole out of sight weeping, and saying: “Yes, let us love him dead.”

For he did love him. He loved the daring and beautiful youth that was dead, and in the depth of his heart he would rather suffer an endless misery than displace him with his present miserable self in Helen’s affection. He was his own rival, and barred himself his own road to happiness. He despaired in his love; and yet was loved. It was a terrible paradox. But the heroic deed by which he had hoped to win her! Alas, he was too weak now to dream of heroic deeds. Resignation, dull and dreary resignation—that was all that was in store for him. If he had only seized his opportunity for greatness while it was yet day; but the night cometh when no man can work. And yet, had he but known it! his great deed was done. But Crooked John did not know it.

He had been lying thus for a week, perhaps trembling on the verge of madness, when a note was sent him by the county physician, saying that Helen had regained her sight. She was constantly asking for him, with much anxiety, though she did not know that she owed her sight to him. The doctor begged him to go to her, as any anxiety at this time might affect her eyes and even plunge her back into darkness. He had scarcely finished reading the note, when he tumbled out of bed and with reeling senses began to dress. It took him a long while; again and again he lay down on the floor and seemed on the point of losing consciousness. It was about eight o’clock in the evening when he stood under the sky and

breathed in the sharp autumnal air. The moon was bright overhead, and the stars sparkled in the nocturnal blue. He tottered along the highway; fell down, and rose again. He scarcely knew how he reached the river-bank; but at end of about three hours he found himself sitting on the ground in the midst of the underbrush that grew close up to the walls of the cottage. A heavy dew was falling, and he shivered with cold. The consciousness of being near to Helen made him tremble, half with joy and half with fear. Should he go to her? Should he speak to her? All the dreadful anticipations of his fever fancies crowded in upon him. No, he could not go to her. But if Helen should lose her sight again, from grief at her not seeing him! It was only for this that she had wished to see—that she might see him. But if she saw him! An agonizing dread shot through him like a fiery arrow. The disappointment, the horror which the sight of him would inspire, might not that too prove dangerous to her—might not that too deprive her of her sight? The question seemed benumbing—overwhelming. He could not answer it. Yet, whether it was well for Helen to see him or not, he could not go away without seeing Helen. He took hold feebly of the alder-bushes and raised himself up; then tottered over to the nearest window. It was close to the ground, and he could look in without difficulty. Before the hearth, upon which a fire was burning, sat the old grandmother, with Helen's head resting in her lap. She was stroking the girl's hair and talking soothingly to her.

"Dinna cry, lassie," she was saying, "he will come yet; crying will put out thy pretty eyes again, just as we have got 'em bright and capable."

"No one cares for me, granny; and I cannot help but cry."

"Shame on thee, lassie, shame! If he dinna care for thee, dost tha think he would ha' workit himself to death to give thee thy sight back again?"

"Granny!"

The girl sprang up with a joyous cry. Her face was as if transfigured. Radiance, rapture, the enchanting certainty of being loved, shone out of her dark, sea-blue eyes, imparting to them a strange, touching beauty.

"O granny!" she cried, sinking down at the old woman's feet; "why did you not tell me?"

"Dinna be so workit up about it, lassie," said her grandmother evasively; "wait till tha hast seen him."

"I always thought of him as beautiful," said Helen, staring radiantly into the fire; "but it matters not now whether he be beautiful or not, I shall love him—love him—love him, even though he be ugly and crooked as a gnome."

She gave a little start as she uttered the words, and pressed her hands suddenly over her eyes.

"They hurt me, granny," she said.

"It is the fire, lassie. Go out into the starlight. That is soft, and good for poor eyes."

Oh, the blessed relief! The removal of the torturing doubt which had held him so long in its clutch was so sudden that it bewildered him. He could not at once adjust his mind to it. And yet in the midst of his darkness there is a great luminous spot, which grows and grows until it fills his soul with light. He staggers away from the window in a blissful intoxication, and places himself in front of the door. The moonshine pours down upon him, and his shadow stretches, black and grotesque, over the grass. With his eyes fixed upon the door, he stands trembling, burning, shivering. His blood surges and throbs in his ears. The door is opened, and Helen becomes visible against the dusk within. He takes a step forward. Merciful God, she must see him now! With a cry he tumbles toward her and clasps her in his arms.

"Helen, beloved! Look at me, hideous though I am! I am not afraid now."

She strains her eyes, she rubs them desperately; she lifts them to the stars. A look of terror passes over her countenance.

"O Harold," she shrieks, "I cannot see you!"

It is as if the night had suddenly engulfed him! It grows black before his eyes; but in the far distance there is a blood-red stripe as of dawn. After a while, through the mists that inwrap his consciousness, comes a vague blissful sensation. Soft fingers glide caressingly over his face; soft lips are warmly pressed against his lips. His body grows light as air; and he floats upward—upward through sunlit space. Stars shoot with dizzying speed across the sky, drawing long luminous trails behind them. He rises—rises ever upward through the shining void. The world grows dim beneath his feet.

WELL-NIGH an hour had passed when her grandmother opened the door and found Helen sitting upon the grass, holding in her arms a pale and shriveled form. She started forward and saw by the light of the moon that it was Crooked John. His face seemed strangely calm, except for a strained expression about his mouth. She stooped down in terror and put her hand upon his forehead. Crooked John was dead.

"May God bless thee, my poor lad," whispered the old woman devoutly, "and give thee peace."

Hjalmar H. Boyesen.

IDEALS.

THERE is but one bird sings like that!
 From Paradise it flew,
 Out to the world, with wavering plumage gay,
 When on creation's glad, awakening day
 The morning wore the dew.

Its nest? In boughs of fadeless bloom,
 Nowhere that we can see.
 The winds have never found it, and the rain
 Of wasting autumns beat the leaves in vain
 On that immortal tree.

It is not nightingale or lark.
 Oh, a diviner bird!
 In moon-touched forests, sweet with night
 and dew,
 In dawn-stirred meadows, when the Spring
 goes through,
 Its voice was never heard.

Its age—its country? No man knows.
 Born for the world's delight.
 No bird that goes through splendors of the
 dawn,
 Or homeward comes, down quiet twilight
 drawn,
 Has wings for such far flight.

Can no one find it? All the world
 Is seeking it—afar.
 Each in his turn has cried, "Lo, it is mine!"
 Oh, bitter-sweet! Still is the joy divine
 Farther than flower from star.

Juliet C. Marsh.

THE REJECTED JAPANESE LOVER.*

WHERE golden-red the lush persimmon grows,
 Where dusk-green sway the pine-boughs dreamfully,
 I choose, my love, I choose at night for thee,
 With fervent vows, a fragrant-petaled rose —
 White as camellias of the isle, whence blows
 A spice-wind o'er the blissful, deep-blue sea,
 And where the long-necked storks feed, tempest-free,
 On sweet palm-buds or ebon-glossy sloes!
 I place it 'neath thy porch within a vase,
 To tell, love, how my heart for thee beats true,
 And of thy heart to beg a tender grace,
 When, wistfully, at dawn I pass thy door.
 Yet what see I, there, dying in the dew?
 My rose, outcast, that whispers — "Hope no more!"

William Struthers.

* In Japan it is etiquette for a lover to select some choice plant and place it, at night, in a vase or flower-pot that hangs suspended by three slender chains from the veranda of such dwellings as possess one or more marriageable daughters. Should his suit be favored, the floral gift is watered and carefully tended; but if, on the contrary, his advances are coldly received by the maiden, or if her kinsfolk object to the alliance, the plant is found withered and forsaken in the garden-walk the following morning.

W. S.

THE SPORTSMAN'S MUSIC.

E. E. WHITE.

NO sportsman worthy of the name is ignorant of the calls of the various game birds; and no sportsman who makes an art of his recreation and is ambitious to succeed is unable to imitate those calls with telling effect. Game birds are not silly noddy-birds that sit to be shot at, and the hunter's skill and ingenuity must be exercised to bring them within his reach. Many species of birds, wonderfully shy, when once startled by a shot, will take wing and fly to great distances, making it impracticable for any sportsman made of human clay to follow them. A knowledge of their calls often enables him to entice them back, and to get shot after shot until he proudly carries away as trophies of his skill the whole assembly. Perhaps there is little love of nature in this; but no sportsman will deny that his knowledge of the language of the birds has made him more profoundly conscious of the beauties of the world in which he lives. In the summer season the quail is filled with domestic dreams, and is engaged in watching the growth of his downy family under the protection of his beautiful mate. At that season of the year the quail's voice is rich and mellow. It has all the full, rounded sweetness of the flute-note mingled with the penetrating, tender quality of the oboe. A musician who thoroughly understood the value of the modern tonalities, who is keen to perceive the key in which an air was pitched, would say at once that the three notes of which this call is composed were suggestive of boldness and triumph as well as of love; that they were certainly the song of a proud, happy, and affectionate father.

At first thought the mind flashes to the conclusion that so beautiful a call should be

easily expressed in the notation commonly used for music. But there is nothing in nature that resembles music. The succession of sustained sounds which composes a melody is not heard. The peculiarity of the songs of all birds is that they never sustain notes. There is a constant *portamento*, or sliding of the sound, which blends one note into another, just as is done in human conversation, making a succession that may be pleasing, but is not melody. The Rev. Mr. Haweis, in his interesting book, "Music and Morals," says: "What has she [nature] done for the musician? She has given him sound, not music. Nowhere does there fall upon his ear, as he walks through the wide world, such an arrangement of consecutive sounds as can be called a musical subject, or theme, or melody. . . . The cuckoo, who often sings a true third, and sometimes a sharp third or even a fourth, is the nearest approach to music in nature." This being the case, it is with a profound sense of the impossibility of doing justice to the call of the quail — or that of any other bird — in musical notes that I here write his summer song in the common notation, as well as I can give it:

Allegro mod.

In the winter, when the birds are full-grown and are gathered in coveys, when the hunting season has begun, you will hear another and equally beautiful call from the quail. After your intelligent dog has pointed, and you have flushed the covey and flashed out your message of destruction to the brown ranks, the birds will scatter in every direction. For a long time there will be silence, and you will wonder what has become of the quail. Be patient, and soon you will hear the splendid bugle-call of the leader as he sounds what may be called the "assembly." It is the summons by which the scattered birds are informed of the chosen rendezvous for the covey. It is similar to the other in some respects. Here it is in musical notation:

This call the quail continues *ad libitum*. The summer call is only given once, when an interval of silence always follows. This second call is sharper and more metallic in tone than

YELLOW-LEGS.

the other, though it is given at about the same tempo, a moderate allegro. I know of no instrument upon which these calls can be performed except that somewhat vulgar one known as the "human whistle." The flute and clarinet cannot give the blending effect, which, as I have said, is never absent from bird-calls. The violin can attain this, of course, but it has not the proper quality of tone. The human whistle, however, can imitate this and all other bird-whistles with such finish as to deceive the bird himself. The writer knows one or two sportsmen who, after shooting into a flushed covey of quail, wait a short time, and then begin whistling the "assembly." They rarely fail to collect the birds at a short distance from them, and thus save much walking. In the summer the quail is much less wild than in the winter, and the writer has frequently enticed one across a ten-acre field by simply answering him every time he sounded his "Ah, Bob White."

Next to the quail's, perhaps the most striking call is the clear, penetrating whistle of the yellow-leg snipe. In the month of September, when the sedges and mud flats are rich in those morsels that tempt the appetites of all the *gallinago* family; when after some easterly storm you will see dowitches and sand-pipers, curlews and willets, killdeer and ring-necked plover whirling through the misty air in wild confusion,—then you will hear the resonant notes of the yellow-leg echoing clear above all the other calls of the snipe. The eager sportsman is lying concealed behind his "blind" of brush and marsh grass, with his gun poised, ready for action. In front of him are spread out his decoys, standing each on its one wooden leg in the shallow water. Soon the yellow-legs, whose shrill notes have been heard, come swooping down toward the counterfeit birds. Just as they are about to "pitch," the sportsman fires both barrels in rapid succession into the thickest part of the wisp. Three or four birds fall dead, one or two more are hopelessly wounded, and the rest

sail away at a rapid pace. The moment he has fired the sportsman begins to whistle, imitating as nearly as he can the call of the birds. If he is expert and knows how to make the notes reach to a distance, he will soon see the fleeing wisp of snipe whirl around and come back in his direction.

But it is when the gunner is hunting for English snipe or Virginia rail and has no decoys with him that he has an opportunity to try his skill as a yellow-leg whistler. He is watching the sagacious movements of his dog, when suddenly, clear as the notes of a silver flute, the call of the yellow-leg drops from the sky. With a word the dog is called in to heel, and the sportsman sinks into the tall reeds. Then he begins to whistle. The snipe replies. The gunner answers him again. The bird slowly circles over the water, gradually dropping lower and frequently whistling. Suddenly he pauses in the middle of his circular flight, and, throwing up his tail, descends almost perpendicularly and with startling rapidity toward an inviting point of mud. Within a few feet of the earth two or three quick flaps of the wings break his fall; and the next moment you will see him standing erect and alert, his keen eyes glancing in every direction, as if wondering where the other snipe can be. Now the wise sportsman stops trying to imitate the bird's call, and devotes his attention to approaching within gunshot. He takes a roundabout course, bending low behind the reeds, until he has come to within thirty-five yards of the snipe. Then he rises up and boldly walks forward at a rapid gait. The bird is so startled that for a moment he sits motionless gazing at his approaching enemy. The gunner has gained four or five yards before the bird is up and off. The yellow-leg is an easy bird to hit and dies quickly, so that the man who approaches to within thirty-five yards gets a good shot. I give, as nearly as I can, the call of the yellow-leg in musical notes:

UPLAND PLOVER.

usually, however, of only three pairs of notes, given out with such shortness and rapidity as to sound almost like a trill. Careful attention will analyze the call into something like this:

The difficulty of imitating the yellow-leg's call is great, but imitating this one is so much more difficult that very few sportsmen ever attain anything like proficiency. Another pretty and somewhat plaintive call is that of the spotted sandpiper, commonly known as the "teeter." The value of this call to the gunner is very small, as the bird can be reached without enticing him, and is a sorry specimen of game when obtained. Still, the call is so peculiar that I have often amused myself by carrying on a monotonous conversation with these wee birds in their own limited language. Here is the call:

Closely akin to this call is that of the upland or grass plover. This splendid game bird haunts the grassy fields, where the openness of the ground is his protection. He is wild at all times and can rarely be approached without resort to artifice of some kind. In some parts of the country it is customary to hunt plover with a horse and wagon, as the birds will permit a vehicle to advance within easy distance of them. From this mere hint at their wildness one would say that the imitation of their call is of little value. So it is for the purpose of enticing birds to come within gunshot a second time. But I have known an expert old gunner, well hidden in marsh grass, to whistle a plover down into the meadows, beside a pond, when the bird was apparently bound for a more distant point. There is, however, another use to which the clever whistler may turn his talent. On some moonlight night in August, when you are standing on the piazza of your cottage by the sea down in New Jersey, when you are trying to count the glittering ripples that dance along the track of the moonbeams, suddenly you will hear dropping out of the clear, starry sky that wonderful bell-like call, so short, sharp, and tremulous that it thrills the bosom of the sportsman. If you can imagine some instrument which would combine all the qualities of flute and a silver bell, like the famous "Carolus" at Antwerp, then you can conceive the exquisite purity of tone which is the chief characteristic of the plover's call. The old sportsman who hears it in an August night knows at once that the plover are beginning to hasten southward. He will stand upon his piazza and imitate it as best he can,—no man can do it perfectly,—and the result will often be that he will call down some of the passing birds into the neighboring fields, where, if he will rise before the sun, he will find them in the cool, gray dawn. The melody of the plover's call is precisely the same as that of the yellow-leg snipe. It consists

To give it anything like its proper effect, it should be made as shrill as possible,—the notes having a peculiar thinness,—and each tone should slide upward nearly a half-tone at the end. This wearisome peeping may be heard in the summer-time along the banks of small streams where the birds build their nests. The woodcock, too, has a call, although it is seldom heard. It consists of a rapid but faint twittering uttered by the bird just before he springs into flight. Few sportsmen are so fortunate as to approach near enough to the bird to hear it. This call it is absolutely impossible to express in musical notation.

A bird which has a charmingly sweet and plaintive call is the meadow-lark. This bird does not belong to the family of game, nor can he be coaxed near the gunner by imitating his call. In many parts of the country

ENGLISH SNIPES.

where game is scarce, this bird is eagerly sought by hunters, as his flesh is white and tender, and he has a straight, rapid flight, which makes him capital practice for a quail-shooter. His call, which is exceedingly strong and can be heard for a long distance, has a pretty rocking motion that makes it very pleasant to hear on a summer morning. This is it:

The English snipe has a call which is only heard when the bird is startled and springs into flight. This call is not a whistle, but an unmusical squeak. It resembles in sound the syllable 'scape! 'scape! Written in musical notes it would be something like this:

VIRGINIA RAIL.

The bird when rising rarely utters this cry more than once, occasionally twice. I do not know that it is ever heard more than twice.

The Virginia rail, a bird which sportsmen along the New Jersey coast are fond of shooting, has a call which is musical and peculiar. The birds are not killed in great numbers, but afford excellent sport. If you happen to be on the New Jersey coast about the middle of September, throw a stone into the calamus reeds at the head of some pond. If any rail are there, you will hear a faint cry of "kek, kek." You can imitate this cry by playing *pizzicato* or plucking with your finger on the D string of a violin below the bridge. As nearly as it can be given in musical notation, it is like this:

kek, kek, kek : kek, kek.

WILLET.

The willet, a member of the snipe family, has a call or note which may be easily imitated, and is often effective in recalling the bird when he appears to be on his way to the ends of the earth. Mr. J. L. Bright told the writer of the peculiar manner in which he discovered the willet's call, and how he immediately used it with good results. Some years ago, when good sport could be found at Long Branch, Mr. Bright was shooting snipe on the beach near the outlet of a small pond. He was shooting from a blind over decoys, in the usual manner. The weather was misty, and there was a strong south-easterly wind. Suddenly five willet came out of the pond, passing immediately over Mr. Bright's head at no great height. They were out of gunshot before he had time to recover from his astonishment. As they passed over him, however, he heard them uttering a sound which was easily imitated. He produced the same sound at once, without much hope of making the birds hear it or of its having any effect. The birds, however, did hear it, circled about, and came back within easy gunshot, when he killed three of them. The sound was a combination of humming and whistling. If you will take a medium note, such as this,

and hum it and whistle it as loudly as possible, both at the same time, you will produce

CANADA GOOSE.

the sound by which the willet betrayed themselves to Mr. Bright.

There is no more splendid call of which I wish to speak. It is the honk of the Canada goose. On a drizzly October day, when the ducks are migrating southward in great flocks, you will suddenly hear that weird, unnatural, and powerful cry. It rings out above the rushing of the wind with a clarion peal that goes straight to the sportsman's heart. Perhaps, as a musician, the writer ought to say that the call of the goose, being a major ninth, is harsh and discordant; but considered as a part of the wintry and often tempestuous weather which the bird seems to love, I cannot look upon it as anything but singularly harmonious and appropriate. Unfortunately for the goose, it can be imitated to perfection, and the unhappy birds frequently meet their end by paying too much heed to its deceptive notes. One instance of peculiar interest has come to the writer's knowledge. The destroyers in this case were Captain Walter S. Green, of Life Saving Station No. 5, Long Branch, and Mr. Bright, who has been before mentioned. These two shooters live on opposite sides of a large pond, and are on the constant watch for birds of any kind that may come in from the sea to rest. Early one morning Mr. Bright heard a distant but vigorous honking. He soon saw a flock of seven geese flying in toward the pond. Quickly getting his gun and some heavy cartridges, he hastened down to the edge of the pond, keeping himself hidden behind a heavy hedge. As soon as he had selected his position, he uttered a vigorous honk, to which the leader of the incoming flock responded. Flying low, they sailed majestically in over the opposite shore, a hundred and fifty yards away from Mr. Bright. They were evidently weary, and anxious to settle down in the smooth waters

of the pond. Suddenly out of the tall marsh grass on the shore opposite Mr. Bright, two puffs of blue smoke and two booming reports rolled out. The leader of the flock folded his wings and fell to the ground dead. Mr. Bright then knew for the first time that Captain Green was at hand. The birds swerved from their course and flew toward Mr. Bright, who easily killed the second bird. Both he and Captain Green did not cease honking, and the birds, after going away to a considerable distance, sailed back again, passing over Mr. Bright's head at some height. With his heavy gun he killed two of them, when they circled and swept across the pond, where Captain Green killed two more. The remaining bird, which had been wounded by scattering shot, made a hard struggle to rise to a safe height. Captain Green hastily slipped in a cartridge and took a long shot. A few feathers fell from the bird, and he flew across the pond. Mr. Bright then got a long shot at him, breaking his wing and bringing him down.

The call of the goose can be imitated by giving the first note in a hoarse, guttural tone, and the second in a strident falsetto. The notes are something like these:

Ha - - onk !

In closing it must be stated that musical characters do not perfectly represent the calls of any of the birds mentioned, but they give an approximate idea of them. It must be remembered that there is always more or less sliding or blending of tones in these calls. In that of the yellow-leg snipe, the first three or four intervals are not as great as semitones, though I have written them so because we have no smaller intervals in modern music.

W. J. Henderson.

POEMS BY SIDNEY LANIER.

THOU AND I.

SO one in heart and thought, I trow,
That thou might'st press the strings and I
might draw the bow,
And both would meet in music sweet,
Thou and I, I trow.

ONE IN TWO.

I'LL sleep, I'll sleep, and dream a sweet death for trouble;
I'll sleep, I'll sleep, and dream that my heart beats double.

More than twice one, beyond all measure more,—
Doth count this singular two of thee and me.

TWO IN ONE.

I SAID to myself
Which is I, which you?
Myself made answer to myself,
Lo, you are I and I am you,
Yet are we twain, we two.

"CHRISTIAN SCIENCE" AND "MIND CURE."*

BY THE AUTHOR OF "FAITH-HEALING AND KINDRED PHENOMENA."

THIRTY years ago the phrases Christian Science and Mind Cure, in the sense now attached to them, were unknown; to-day in the press, in conversation, in literature, and especially in discussions relating to health and disease, and to the more occult phenomena of human nature, they frequently occur. To many they have no definite meaning, and long conversations are carried on concerning them in which the most diverse views are maintained, ending in confusion and contradiction, because those who converse have not a uniform conception of the signification of the terms. Some declare Christian Science and Mind Cure to be the same; others stoutly deny this, and seek to establish a radical distinction. Some represent Christian Science as a great advance upon ordinary Christianity; others denounce it as but refined Pantheism; while many more brand both Christian Science and Mind Cure as delusion, a reaction from the uncompromising materialism of the age.

Mrs. Mary Baker Glover Eddy, President of the Massachusetts Metaphysical College, claims to have been the first to use the phrase "Christian Science."

"It was in Massachusetts, in the year 1866, that I discovered the Science of Metaphysical Healing, which I afterwards named Christian Science. The discovery came to pass in this way. During twenty years prior to my discovery I had been trying to trace all physical effects to a mental cause; and in the January of 1866 I gained the scientific certainty that all causation was Mind, and every effect a mental phenomenon."

Mrs. Eddy further states that about the year 1862 her health was failing rapidly, and she "employed a distinguished mesmerist, Mr. P. P. Quimby—a sensible, elderly gentleman, with some advanced views about healing.

. . . There were no Metaphysical Healers then. The Science of Mental Healing had not been discovered."

Whether or not Mrs. Eddy is indebted for her ideas to Mr. Quimby has since been the subject of heated discussion; for the short time which has elapsed since the "discovery" has been long enough for the development of several rival schools, which have engendered toward one another as much intensity of feeling as the *odium theologicum* and *odium medicum* combined. Speaking of her rivals,

Mrs. Eddy modestly observes, "Some silly publications, whose only correct or salient points are borrowed, without credit, from 'Science and Health,' would set the world right on Metaphysical Healing, like children thrumming a piano and pretending to teach music or criticise Mozart."

The history of the discovery is of sufficient importance to be given. "The cowardly claim that I am not the originator of my own writings, but that one P. P. Quimby is, has been legally met and punished. . . . Mr. Quimby died in 1865, and my first knowledge of Christian Science, or Metaphysical Healing, was gained in 1866. . . . When he doctored me I was ignorant of the nature of mesmerism, but subsequent knowledge has convinced me that he practiced it." Mrs. Eddy says that after having been for many years a sufferer from chronic diseases, she met with an accident which produced, according to physicians, a fatal injury. They gave her up to die, and declared that she would not live till noon. She replied that she would be well at that time. Her pastor called after service and found her busy about the house. One of her assistants says that "while she knew that she was healed by the direct and gracious exercise of the divine power, she was indisposed to make an old-time miracle of it."

After three years' meditation she concluded that her recovery was in accordance with general spiritual laws, capable of being known and clearly stated. She then began to teach and write; though prior to the expiration of the three years, namely, in 1867, she taught a purely metaphysical system of healing to, as she says, "the very first student who was ever so instructed since the days of the Apostles and the primitive Church." Her essays were circulated among her students privately. In 1870 she copyrighted her first pamphlet, but did not publish it till six years afterwards.

In 1876 she organized the Christian Scientist Association, and in 1879, at a meeting of that association, she organized a Church, "a Mind Healing Church, without creeds, called the Church of Christ." To the pastorate of this she accepted a call, and was ordained A. D. 1881. The college flourishes, the church has an assistant pastor, and Mrs. Eddy receives so much patronage as a teacher as to compel the publication of the following:

"The authoress takes no patients, and has no time for medical consultation."

* See this magazine for June, 1886, and March, 1887.

Practitioners, who of course are not obliged to waste much time upon such sordid things as anatomy, physiology, or materia medica, are prepared with great rapidity. The primary class in Christian Science Mind Healing includes twelve lessons. In the first week six of these are given. The term continues only about three weeks, and the charge for tuition is \$300. The normal class requires six lectures. Graduates from the primary class are advised to practice at least one year before entering this class, and for these six lectures they must pay \$100. There is also a class of Metaphysical Obstetrics which requires only six lectures, for which \$100 must be paid. In addition to these there is a class in Theology, including six lectures on the Scriptures, for which \$200 must be paid. The largest discount to an indigent student is \$100 on the first course. Husbands and wives, if they enter together the primary class, may pay \$300; but, entering at different times, must pay the regular price, and must do that for all other courses, payment being made strictly in advance. It is obvious, therefore, that the benefits of the Mind Cure cannot be applied to commercial transactions; and that 800 material dollars, exclusive of board, are required to master the Science of Metaphysical Healing,—unless one were to say that the national bank notes are merely material symbols of an immaterial and impalpable essence.

Considering the short time that has elapsed since the "discovery," the number of practitioners, as advertised in one of their magazines, is very large. Sixty-six are women, and twenty-nine men; and all but five of the men appear to be associated with their wives in the practice of the profession. There are also Christian Science institutes and colleges advertised; two in New York, four in Chicago, one in Milwaukee, one in Brooklyn, and one in Colorado. The other institutions do not charge so large a sum as Mrs. Eddy. Some of them agree to give sufficient instruction for \$25 to justify the would-be practitioner in beginning. Others communicate all they know, with the privilege of meeting for conversation once a month for a year, on payment of \$100. They give diplomas, valued according to the standing of the respective schools. Impostors also have arisen, so that Mrs. Eddy has notified the public that all persons claiming to have been her pupils, who cannot show diplomas legally certifying to that effect, are preferring false claims.

THEORY.

By a careful examination of the works of those who have written upon this subject, including Evans, Grimbé, Stuart, Arens, Tay-

lor, Baldwin, Hazzard, Nichols, Marston, etc., and by conversation with Mental Healers, Christian Scientists, and their patients, I have ascertained that most of them concur with Mrs. Eddy in the fundamental principles of the system, and that where they diverge it is upon minor points.

Her hypothesis is that "the only realities are the Divine Mind and its ideas. . . . That erring mortal views, misnamed *mind*, produce all the organic and animal action of the mortal body. . . . Rightly understood, instead of possessing sentient matter, we have sensationless bodies. . . . Whence came to me this conviction in antagonism to the testimony of the human senses? From the self-evident fact that matter has no sensation; from the common human experience of the falsity of all material things; from the obvious fact that mortal mind is what suffers, feels, sees; since matter cannot suffer."

The method of Mrs. Eddy's reasoning may be seen in the following extracts:

"The ineradicable belief that pain is located in a limb which has been removed, when really the sensation is believed to be in the nerves, is an added proof of the unreliability of physical testimony. . . . Electricity is not a vital fluid, but an element of mortal mind,—the thought-essence that forms the link between what is termed matter and mortal mind. Both are different strata of human belief. The grosser substratum is named *matter*. The more ethereal is called *human mind*, which is the nearer counterfeit of the Immortal Mind, and hence the more accountable and sinful belief. . . . You say, 'Toil fatigues me.' But what is this *you* or *me*? Is it muscle or mind? Which one is tired and so speaks? Without mind, could the muscles be tired? Do the muscles talk, or do you talk for them? Matter is non-intelligent. Mortal mind does the talking, and that which affirms it to be tired first made it so."

Having adopted a theory, she does not shrink from its logical sequences:

"You would not say that a wheel is fatigued; and yet the body is just as material as the wheel. Setting aside what the human mind says of the body, it would never be weary any more than the inanimate wheel. Understanding this great fact rests you more than hours of repose."

Her most frequently repeated assertions are such as these:

"God is supreme; is mind; is principle, not person; includes all and is reflected by all that is real and eternal; is Spirit, and Spirit is infinite; is the only substance; is the only life. Man was and is the idea of God; therefore mind can never be in man. Divine Science shows that matter and mortal body are the illusions of human belief, which seem to appear and disappear to mortal sense alone. When this belief changes, as in dreams, the material body changes with it, going wherever we wish, and becoming whatsoever belief may decree. Human mortality proves that error has been engrafted into both the dreams and conclusions of material and mortal humanity. Besiege sickness and death with these principles, and all will disappear."

As these doctrines are unquestionably in substance such as have been held by certain

metaphysicians in past ages, Mrs. Eddy feels called upon to answer those who make that charge:

"Those who formerly sneered at it as foolish and eccentric now declare Bishop Berkeley, David Hume, Ralph Waldo Emerson, certain German philosophers, or some unlearned mesmerist, to have been the real originators of Mind Healing. Emerson's ethics are models of their kind; but even that good man and genial philosopher partially lost his mental faculties before his death, showing that he did not understand the Science of Mind Healing, as elaborated in my 'Science and Health'; nor did he pretend to do so."

Sickness, then, is a dream of falsity, to be antagonized by the metaphysical healer, mentally, and audibly when it may be necessary.

Mrs. Eddy's theories are her religion, and her Science — so called — is based upon the religious principles which she holds.

One of Mrs. Eddy's former students, named Arens, for whom she entertains a strong spiritual antipathy, has published a volume called "Old Theology in its Application to the Healing of the Sick." In the introduction he writes:

"It will be unnecessary to ask the reader for charitable criticism when I say that I make no claims to being a ripe scholar, and that my knowledge of the English language is very imperfect. The truths set forth in this volume have been expressed as clearly as possible, considering the disadvantages under which I have labored, one of which is the poverty of words in the English language to express spiritual thoughts. It has been found necessary to employ close punctuation, and in some instances to disregard some rules of grammar and rhetoric, in order to give the requisite shade of thought."

The mental difficulty in understanding him arises from his incompetency as a writer. His reflection upon the poverty of the English language is another form of confessing his ignorance of it; and his disregard of the rules of grammar and rhetoric does not result from his difficulty in giving shades of thought, but from his lack of knowledge of the language. Mrs. Eddy thus described him in 1883:

"When he entered the class of my husband, the late Asa G. Eddy, in 1879, he had no knowledge whatever, and claimed none, as can be shown under his own signature, of Metaphysics or Christian Science. . . . While teaching him my system of Mental Healing, his motives and aims and the general constitution of his mind were found so remote from the requirements of Christian Science, that his teacher despaired of imparting to him a due understanding of the subject. Perhaps it was to meet this great want without remedying it, and cover his lack of learning, that he committed to memory many paragraphs from my works, and is in the habit of repeating them in his attempts to lecture. He, who now proclaims himself a professor in the solemn department that he assumes as a jay in borrowed plumes, was the most ignorant and empty-minded scholar I ever remember of examining."

That his earlier work consists largely of passages taken from Mrs. Eddy's writings, and that it is as a whole in every respect inferior to them, is the simple statement of a fact.

He has, however, acquired considerable reputation, and has a constituency. Before advancing the fundamental principles of his system, he attempts to show the inconsistencies of medical science in the following passage:

"Materia medica teaches that mercury cures, also that mercury kills; that ipecac causes vomiting, and that an overdose checks it, etc.; these are contradictions in themselves. A rule that can be contradicted is not demonstrable, and therefore not truth. If one and one made two only occasionally, and at other times made three or more, it would be no fact or rule, because not demonstrable, and no dependence could be placed upon it. If from a science (truth) it is found that mercury cures, it would be found that the more of that so-called necessary quality taken into the system, the better it would be for the patient; such would be the result from a perfect rule or from truth."

Here is an example of his style:

"Suppose I should be walking past a house, and a pane of glass should fall from an upper window cutting me and causing my death; the glass was made and placed by life, and life broke it and caused it to fall. My life brought me here from Prussia and carried me by the house at the time that happened; therefore life was the cause of my death, and, strange as it may seem, is the cause of all action."

From this profound (?) reasoning he concludes:

"If life is the cause of all action it must be the cause of sickness. . . . Thought is the first product of life, and as the thought is so will the action be. Life cannot act contrary to the thoughts which are become beliefs or opinions, that is, which have taken root or are become attached to it, unless it acts unconsciously."

Mrs. Eddy sued this Dr. Arens for infringing her copyright, and got judgment against him, so that he was compelled to destroy a large edition of one of his pamphlets.

Dr. Arens has established a university in the city of Boston, incorporated a year or two ago, called the "University of the Science of Spirit." It confers the following degrees: "F. D.," Defender of the Faith, and "S. S. D.," Doctor of the Science of Spirit. The charge for instruction in the general course is one hundred dollars. These courses are somewhat pretentious. The first treats the "Scientific Basis of Theology," "the Difference between God and the Universe," etc., and, proceeding through twenty-one theological points, concludes by setting forth "the First Step in Immortality," and "How to Destroy Sickness." The second course discusses "Theos, Chaos, and Cosmos"; gives a theory of the creation of the universe down to the creation of the "first material human body," which it treats under "its outline and quality; the necessity for respiration; the first consciousness of existence; the separation of male and female; the origin of self-will and its results." And finally, "the beginning of sickness and trouble."

Dr. Marston treats "God, Man, Matter,

Disease, Sin and Death, Healing, Treatment, and Universal Truth." In his book he states that "the mental healer does not care by what medical name the distress is known; it may be nervousness, dyspepsia, asthma, fever,— words all alike to him, since the effects they denote are simply reflections or registers of wrong thinking." In illustrating this he says:

"A case may be cited to illustrate the meaning: A middle-aged man who has suffered many years with *hypochondria*, until it is torture for him to move, has also an exorbitant temper, a despotic will, and is so arrogant that he cannot abide opposition, but flies into a towering rage if he is crossed. He has had many physicians who ascribe the painful inflammation of his joints to an improper secretion of uric acid; and his nervousness and irritability are easily accounted for by the prolonged suffering he has endured. This case presents the same conditions to the mental healer, but the conclusions are different. To him the bodily trouble is a reflection or effect of lack of mental ease; and the irascible nature results from a dominant feeling that other people are enemies seeking to oppose the poor man's wishes and thwart his plans. In treating the case, the healer addresses remedies to the disturbed secretions which are an effect, while the mental healer directs his to the primary cause, which is fear."

His cure is reduced to its simplest form as follows: "The senses say matter can suffer pain; God says matter is insensible. The senses declare a man sick; God says the real man knows nothing of disease." Under the head of Sin and Death he says: "Scientific Christianity does not recognize the definition of theology, but holds that, strictly speaking, there is no sin." He finally describes the cure thus: "A mental cure is the discovery made by a sick person that he is well."

W. F. Evans, a voluminous writer, formerly an evangelical minister, then a Swedenborgian, and now a mental healer, remarks:

"The process is essentially a spiritual work; it is held that there is a part of us that is never sick, and this part is mentally worked upon so as to control the sick person's consciousness, this destroys the sickness, for mind cures matter. A disciple of this school is sick—no, he is not sick, for that is something which he will not admit; he has a belief that he is sick; he then says mentally to the rebellious body, 'What are you?' You have no power over me; you are merely the covering given to me for present purposes; it is an error to suppose that I am sick; I recognize the great truth that I *am not*, for I am *immortality*, my personality, my mind, cannot be sick, for it is immortal, made in the image of God; when I recognize the existence of that truth there is no room left for the existence of error; two things cannot occupy one and the same place; error cannot exist in the same place with truth, therefore error is not in existence; hence I am not sick."

Mrs. Grimké, the author of "Personified Unthinkables," says:

"Now, rheumatism or pneumonia, etc., are *verbal* expressions for unthinkables, just as $2+2=5$ is a verbal expression for a lie. By means of the picturing faculty, both of the individual and of those about him, the outward manifestation of the unthinkable will express itself upon the body just as surely as the magic-lantern

will reflect the picture inserted between the light and the lenses when the proper conditions are met. . . . The problem of Health, then, would be how to cultivate and keep clean and healthy pictures in the mind. Health would then be an essential part of the ego. Man would be a strict unity, not a trinity, of Intellect, Body, and Morals. And the absolutely necessary postulates of this *Unity* would be Infinite Mind, Freedom, and Eternal Life."

There are those who in their own opinion have reached a greater elevation than either the Christian Scientists or the Mind Curers, "and profess to heal by the transfer of psychic energy." The chief practitioner in this sphere informed me that the relative rank of these sciences is, 1. The lower grade—the mere physical system. 2. What is called animal magnetism. 3. The mind cure. 4. The spirits (when they are good spirits). 5. Including all that is good in the others, he places in the *supernal*. He claimed that there has been in all ages an order called the *Inspirati*, who practiced this method, and offered to make me a Knight of that order.

This will suffice until it fails to attract patients, when, no doubt, a sixth order, that of the *Empyrean*, will be devised.

Some of the Christian Scientists have attempted to construct a technical language, which, when translated, shows that they attach as much importance to learned terms as does any form of the material science that they denounce. "Gnosis.—The 'Spiritual Understanding,' the 'Immediate Intuition.' VIR.—The God in Man. HARMATIA.—Off-the-trackness. HOMO.—The Creature of God. EGO.—The Homo *as he is*. NEMO.—The Homo as he sees himself. ENTHEASM.—Direct communication with God. NIHILOID.—Like unto nothing, the proper name of disease, disorder, discomfort. YOGA.—Concentration of Thought. DAMA.—Subjugation of Sense. KARMA.—Law of Cause and Effect. MAYA.—Illusion, 'Mortal Mind,' False Beliefs.—Chaos, The *Habitat* of Humbug."

Most of these terms appear to have had an oriental origin, and are as valuable in affecting the ordinary mind as chloride of sodium for salt, capsicum for pepper, and H_2O for water. They serve also to make it appear that the Science is difficult, and that large fees for instruction are reasonable.

They make use of certain forms of expression which savor more strongly of cant than any phrases that have ever been used by religious sects. They use the word "belief" in speaking of a disease, or even of a defect of character. A lady, talking with a practitioner of this school of a mutual acquaintance, said she thought her selfish. "Yes," replied the Christian Scientist, "I believe she has a strong belief in selfishness."

To a patient who had every symptom of a torpid liver another healer of the school said, "It is unfortunate that you have such a belief in bile." To which the astonished patient, new to the Science, replied that he thought any one would have the same belief who had the same kind of liver.

PRACTICE.

THE manner in which Christian Science antagonizes dreams of falsity is interesting, whether the theories be accepted or not.

First. Both the patient and the metaphysical healer must be taught that

"Anatomy, Physiology, Treatises on Health, sustained by what is termed material law, are the husbandmen of sickness and disease. It is proverbial that as long as you read medical works you will be sick. . . . Clairvoyants and medical charlatans are the prolific sources of sickness. . . . They first help to form the image of illness in mortal minds, by telling patients that they have a disease; and then they go to work to destroy that disease. They unweave their own webs. . . . When there were fewer doctors, and less thought was given to sanitary subjects, there were better constitutions and less disease."

Second. Diet is a matter of no importance.

"We are told that the simple food our forefathers ate assisted to make them healthy; but that is a mistake. Their diet would not cure dyspepsia at this period. With rules of health in the head, and the most digestible food in the stomach, there would still be dyspeptics."

Third. Exercise is of no importance.

"Because the muscles of the blacksmith's arm are strongly developed, it does not follow that exercise did it, or that an arm less used must be fragile. If matter were the cause of action, and muscles, without the coöperation of mortal mind, could lift the hammer and smite the nail, it might be thought true that hammering enlarges the muscles. But the trip-hammer is not increased in size by exercise. Why not, since muscles are as material as wood and iron?"

Fourth. A proper view of Mrs. Eddy's publications is, however, of great importance.

"My publications alone heal more sickness than an unconscientious student can begin to reach. If patients seem the worse for reading my book, this change may either arise from the frightened mind of the physician, or mark the crisis of the disease. Perseverance in its perusal would heal them completely."

Fifth.

"Never tell the sick they have more courage than strength. Tell them rather that their strength is in proportion to their courage. . . . Instruct the sick that they are not helpless victims; but that, if they only know how, they can resist disease and ward it off, just as positively as they can a temptation to sin."

Sixth. In preparing to treat patients the healer must strengthen and steady his own mind.

"Be firm in your understanding that Mind governs the body. Have no foolish fears that matter governs, and can ache, swell, and be inflamed from a law of its own; when it is self-evident that matter can have no pain or inflammation. . . . If you believe in inflamed or weak nerves, you are liable to an attack from that source. You will call it neuralgia, but I call it Illusion.

. . . . When treating the sick, first make your mental plea in behalf of harmony, . . . then realize the absence of disease. . . . Use such powerful eloquence as a Congressman would employ to defeat the passage of an inhuman law."

Seventh. You are fortunate if your patient knows little or nothing, for "a patient thoroughly booked in medical theories has less sense of the divine power, and is more difficult to heal through Mind, than an Aboriginal Indian who never bowed the knee to the Baal of civilization."

Eighth. See that the "minds which surround your patient do not act against your influence by continually expressing such opinions as may alarm or discourage. . . . You should seek to be alone with the sick while treating them."

Ninth. Bathing and rubbing are of no use.

"Bathing and rubbing to alter the secretions, or remove unhealthy exhalations from the cuticle, receive a useful rebuke from Christian Healing. . . . John Quincy Adams presents an instance of firm health and an adherence to hygienic rules, but there are few others."

Tenth. What if the patient grow worse?

"Suppose the patient should appear to grow worse. This I term *chemicalization*. It is the upheaval produced when Immortal Truth is destroying erroneous and mortal belief. Chemicalization brings sin and sickness to the surface, as in a fermenting fluid, allowing impurities to pass away. Patients unfamiliar with the cause of this commotion, and ignorant that it is a favorable omen, may be alarmed. If such is the case, explain to them the law of this action."

Eleventh. Subtle mental practices are recommended.

"I will here state a phenomenon which I have observed. If you call mentally and silently the disease by name, as you argue against it, as a general rule the body will respond more quickly; just as a person replies more readily when his name is spoken; but this is because you are not perfectly attuned to Divine Science, and need the arguments of truth for reminders. To let Spirit bear witness without words is the more scientific way."

This is further modified:

"You may call the disease by name when you address it mentally; but by naming it *audibly*, you are liable to impress it upon the mind. The Silence of Science is eloquent and powerful to unclasp the hand of disease and reduce it to nothingness."

Twelfth. Some of the things that are *not* to be done:

"A Christian Scientist never gives medicine, never recommends hygiene, never manipulates. He never tries to 'focus mind.' He never places patient and practitioner 'back to back,' never consults 'spirits,' nor requires the life history of his patient. Above all, he cannot trespass on the rights of Mind through animal magnetism."

The foregoing rules for practice are taken from Mrs. Eddy's different works.

The difference between the views of Mrs. Eddy and those who diverge from her is superficial, though neither she nor they will

admit it. Mrs. Kate Taylor, in "Selfhood Lost in Godhood," referring to Mrs. Eddy's large work, says: "It can be read with profit by any who are seeking truth with sincerity, and with no tendency to become biased." She also says that she was formerly a member of the Christian Science Association, and "learned that limitations are not conducive to growth, and that, as Emerson truly says, 'God always disappoints monopolies,'" and frankly gives her opinion of those denounced by her former preceptor.

"The so-called mal-practitioners and mesmerists therein mentioned, on thorough investigation,—not only by myself, but in company with others who seek to be liberal-minded and to give Truth its due wherever it exists,—I find to be simply those who have separated themselves from the Association, that they might pursue their own convictions of right, and step out of the regular ranks of stereotyped terms to let their thoughts and expression in their own words."

The chief point of departure in Mrs. Taylor's theories from those of Mrs. Eddy is in the value attached to a knowledge of the preceding life of the patient.

"Physical disease has many different causes. The physician treating a patient is often narrowed in his efforts to do good, because of some hidden moral or mental cause, some underlying fear, some sorrow, some inherited proclivity, some wrong unforgiveness, some trait of character, some past occurrence which has tinged, perhaps almost unconsciously, the whole tenor of a life. It is not necessary that a person's innermost sacred thoughts and life be unveiled, as the physician does not expect, neither does he like, to receive confidences, unless, indeed, they are given voluntarily with a feeling of trust. Some word or hint, though, to the physician would often aid materially. . . . The treatment consists in a vigorous holding of the patient to his right of soul-growth, unobstructed and retarded by physical defects. . . . In answer to the question, 'Is it prayer?' I would first quote Victor Hugo's definition of prayer,—'Every thought is a prayer; there are moments when, whatever be the attitude of the body, the soul is on its knees,'—and then answer, Yes, it *is* prayer. *Prayer* with the old interpretation begs the Father to change the unchangeable, while *prayer* with the new interpretation lifts the beggar to a comprehension that he himself has omitted to take the gifts already prepared for him from the foundation of the world."

She gives this advice to the sick:

"Eradicate all thoughts of physiology, drugs, laws of health, sickness, and pain, and know that God is the only panacea,—divine love the only medicine. . . . Seek the help of a Christian Healer. . . . Judge him not unjustly, . . . neither be in opposition, for his is a good motive. . . . While under his treatment obey any natural impulse, without fear of consequence. Remember! without fear. This does not mean to be foolhardy in the beginning,—unless the cure should be almost instantaneous,—but advance gradually. . . . If you have a time during the treatment when you should feel worse, do not be discouraged. . . . Look forward. . . . One little secret it is well to know. . . . Deny every thought of sickness every time it enters your mind. . . . Never use will-power, mistaking it for divine Truth."

Also Mrs. Stuart teaches the importance of a knowledge of the previous life:

"A man came to me from Erie, Penn., with what was called by different M. D.'s softening of the brain and Bright's disease of the kidneys. After questioning him, I found his trouble dated back to the Chicago fire. Now he was not conscious of any fear, was in no personal danger for himself or family. But he was in that atmosphere of mental confusion and terror all through the city. He was cured by treatment on that point and nothing else. A woman came to me who had suffered five years with what the doctors called rheumatism. I happened to know that the death of a child had caused this effect. By silently erasing that picture of death and holding in its place an image of Life, eternal Life, she was entirely cured in twenty minutes."

SPECIMEN TREATMENTS.

MENTAL treatment is that which the metaphysical healer is supposed to be giving the patient when she sits silently before him for a period longer or shorter according to her judgment of the necessities of the case. Some of the practitioners have revealed the thoughts which constitute a mental treatment, so that if truth is an element of their system, we can speak confidently upon this part of it.

"I said to him mentally: 'You have no disease; what you call your disease is a fixed mode of thought arising from the absence of positive belief in absolute good. Be stronger,' I said, 'you must believe in absolute good; I am looking at you, and I see you a beautiful, strong spirit, perfectly sound. What makes you think yourself diseased? You are not diseased; the shadow of a doubt is reflected on your feet, but it has no real existence. There, look down yourself and see that it is gone. Why, it was a mere negation, and the place where you located it now shows for itself as sound as the rest of your body. Don't you know that imperfection is impossible to that beautiful creature, your real self? Since there is no evil in all the universe, and since man is the highest expression of good amidst ubiquitous Good, how can you be diseased? You are not diseased. There is not an angel in all the spheres sounder or more divine than you.' Then I spoke out aloud: 'There now,' I said, 'you won't have that pain again.' As I said it there was a surge of conviction through me that seemed to act on the blood-vessels of my body and made me tingle all over."—HELEN WILMANS.

To this treatment I shall refer in elucidating the causes of the phenomena.

Dr. Evans controverts some of Mrs. Eddy's theories:

"To modify a patient's thinking in regard to himself and his disease, we employ the principle of suggestion or positive affirmation—not mental argument, as it is sometimes called, for argument creates doubt and reaction. No sick man was ever cured by reasoning with him, mentally or verbally. It is the business of the man who *knows* the truth, not to argue, but to *affirm*. . . . No intelligent practitioner of the mind cure will ignore wholly all medical science. . . . The phrenopathic system is not necessarily antagonistic to other methods of cure, as the various hygienic regulations, and even the use of the harmless specific remedies."

He repudiates Mrs. Eddy's ideas about the personality of God, and says:

"It is not necessary to deny the personality of God. . . . Neither is it necessary to deny the personality and persistent individuality of the human spirit."

He also flatly denies Mrs. Taylor's theories, saying, "The selfhood is not lost in Godhood." "It is not necessary to tell a man dying of consumption that he is not sick, for that is not true." He says that one may or may not use the imposition of hands in healing the sick.

As an example of Christian Science superstition exceeding anything attempted by the most ignorant advocates of patent Faith Healing, read the following, taken *verbatim*, italics, small caps, etc., from a text-book on Mind Cure, issued by the President of the "New York School of Primitive and Practical Christian Science," who states that *his* school will be free from "eccentricity, pretension, and fanaticism"!

"PRAYER FOR A DYSPEPTIC.

"Holy Reality! We BELIEVE in Thee that Thou art EVERYWHERE present. We *really* believe it. Blessed Reality we do not pretend to believe, think we believe, believe that we believe. WE BELIEVE. Believing that Thou art every where present, we believe that Thou art in this patient's stomach, in every fibre, in every cell, in every atom, that Thou art the sole, only Reality of that stomach. Heavenly, Holy Reality, we *will* try not to be such hypocrites and infidels, as every day of our lives to affirm our faith in Thee and then immediately begin to tell how sick we are, forgetting that Thou art everything and that Thou art not sick, and therefore that nothing in this universe was ever sick, is now sick, or can be sick. Forgive us our sins in that we have this day talked about our backaches, that we have told our neighbors that our food hurts us, that we mentioned to a visitor that there was a lump in our stomach, that we have wasted our valuable time which should have been spent in Thy service, in worrying for fear that our stomach would grow worse, in that we have disobeyed Thy blessed law in thinking that some kind of medicine would help us. We know, Father and Mother of us all, that there is no such a thing as a really diseased stomach, that the disease is the Carnal Mortal Mind given over to the World, the Flesh, and the Devil; that the mortal mind is a twist, a distortion, a false attitude, the HARMATIA of Thought. Shining and Glorious Verity, we recognize the great and splendid FACT that the moment we really believe the Truth, Disease ceases to trouble us, that the Truth is that there is no Disease in either *real* Body or Mind; that in the Mind what *seems* to be a *disease* is a False Belief, a Parasite, a hateful Excrescence, and that what happens in the Body is the shadow of the LIE in the Soul. Lord, help us to believe that ALL Evil is Utterly Unreal; that it is silly to be sick, absurd to be ailing, wicked to be wailing, atheism and denial of God to say 'I am sick.' Help us to stoutly affirm with our hand in Your hand, with our eyes fixed on Thee that we have no Dyspepsia, that we never had Dyspepsia, that we will never have Dyspepsia, that there is no such thing, that there never was any such thing, that there never will be any such thing. Amen."—HAZZARD.

It is claimed by all the Christian Science and Mind Cure practitioners that they can operate upon patients *at a distance*.

"There is no space nor time to mind. A person in St. Louis may be near to me while I am in New York. A person in the same room may be very distant. Sit

down and think about the person you wish to affect. Think long enough and strong enough and you are sure to reach him."—HAZZARD.

"The following is a case of heart disease which I cured without having seen the patient. 'Please find enclosed a check for five hundred dollars, in reward for your services that can never be repaid. The day you received my husband's letter I became conscious for the first time in forty-eight hours. My servant brought my wrapper, and I arose from bed and sat up. . . . The enlargement of my left side is all gone, and the doctors pronounce me rid of heart disease. I had been afflicted with it from infancy. It became organic enlargement of the heart and dropsy of the chest. I was only waiting and almost longing to die, but you have healed me. How wonderful to think of it, when you and I have never seen each other.'"—EDDY.

One of them says:

"Remember that every thought that you think will be transferred to the persons thought of if you think long enough and strong enough."—HAZZARD.

This of course surpasses the love powders that are sold among the colored people and the ignorant, as it is necessary to purchase and administer them, which is sometimes considerable trouble.

The practical directions to attain this power are as follows:

"How to 'concentrate.' 1. Look at an object on the ceiling ten minutes; think of that object alone. 2. Write a proposition on a sheet of paper, as 'God is the only reality.' Think it for ten minutes with your eyes fixed upon the paper. 3. Begin to think of a subject, and give a dollar to the poor for every time your mind wanders. How to 'subjugate.' Forget yourself, forget the world, forget you have a body, forget you have any business or friends. Empty your mind of its contents. Be a man of one idea. Get out of yourself."—HAZZARD.

The rules for absent treatment are:

"1. Seat yourself alone. Let the room be silent. 2. Subjugate your senses to all else but your thought. 3. Fix your thought upon the patient. 4. Picture him in your mind. 5. Go through the treatment."—HAZZARD.

"The patient may be in three different ways. He may be sympathetic; that will help you greatly. He may be apathetic; that is not so good, but better than the next. He may be antipathetic, hostile; then say not a word, but *silently* 'give it to him' till he becomes less 'cantankerous' and more Christlike."—HAZZARD.

MIND CURERS *versus* FAITH HEALERS,
MESMERISTS, ETC.

MRS. EDDY speaks of Mesmerism in this way:

"Mortal mind, acting from the basis of sensuous belief in matter, is animal magnetism. . . . In proportion as you understand Christian Science you lose animal magnetism. . . . Its basis being a belief and this belief an error, animal magnetism, or mesmerism, is a mere negation, possessing neither intelligence nor power. . . . An evil mind at work mesmerically is an engine of mischief little understood. . . . Animal magnetism, clairvoyance, mediumship, and mesmerism are antagonistic to this Science, and would prevent the demonstration thereof. . . . The Mesmeriser produces pain by making his subjects believe that he feels it; here pain is proved to be a belief without any adequate cause. That social curse, the mesmerist, by making his victims believe they cannot move a limb, renders it im-

possible for them to do so until their belief or understanding masters his."

Of Spiritualism:

"Spiritualism with its material accompaniments would destroy the supremacy of Spirit."

And of Clairvoyance specifically:

"Clairvoyance investigates and influences mortal thought only. . . . Clairvoyance can do evil, can accuse wrongfully, and err in every direction."

Of Faith Cure:

"It is asked, Why are faith cures sometimes more speedy than some of the cures wrought through Christian Scientists? Because faith is belief, and not understanding; and it is easier to believe than to understand Spiritual Truth. It demands less cross-bearing, self-renunciation, and Divine Science, to admit the claims of the personal senses, and appeal for relief to a humanized God, than to deny those claims and learn the divine way, drinking his cup, being baptized with his baptism, gaining the end through persecution and purity. Millions are believing in God, or Good, without sharing the fruits of goodness, not having reached its Science. Belief is mental blindness, if it admits Truth without understanding it. It cannot say with the Apostle, 'I know in whom I have believed.' There is even danger in the mental state called belief, for if Truth is admitted but not understood, error may enter through this same channel of ignorance. The Faith cure has devout followers, whose Christian practice is far in advance of mere theory."

Marston, speaking of change in the inverted thought of the sick person, says:

"Since a change of the inverted thought of the sick person is all that can be produced by extraneous influence, the treatment of a professional Healer is not the only means of securing it. While a majority of cases are affected in that way, there are well-attested instances to show that anything that will enable the sick person to change his thought may put him in a condition to receive spiritual healing. A text from Scripture or some other writings may be brought to his mind with such force as to do this, or some sudden event may startle him out of his chronic delusion. It is in this way alone that we can account for cures that seem to result from prayer, a resort to relics, charms, and other things believed to possess peculiar virtue. This is why good results follow any one of the thousand absurd acts, by the performance of which superstitious and credulous people seek to be restored to health."

Mrs. Kate Taylor remarks:

"The question is often asked, In what does the Christian Science healing differ from the faith cure? In the faith cure the patient must have faith; in Christian Science that is not necessary; patients have frequently been helped or entirely cured, without knowing they were being treated. . . . No great faith is necessary on the part of the patient; but it will expedite his recovery if he take interest enough in the method by which he is being healed to read suitable books on the subject, and converse profitably with the healer. . . . Prayer to a personal God affects the sick like a drug that has no efficacy of its own, but borrows its power from human faith and belief. The drug does nothing because it has no intelligence."

TESTS OF THE THEORY.

First Test. If their principles be true, food should not be necessary. Mrs. Eddy affirms this:

VOL. XXXIV.—52.

"Gustatory pleasure is a sensuous illusion, an illusion that diminishes as we understand our spiritual being and ascend the ladder of Life. This woman learned that food neither strengthens nor weakens the body,—that mind alone does this. . . . Teach them that their bodies are nourished more by Truth than by food."

Then, finding herself unable to silence the testimony of the senses, she endeavors to circumvent it thus:

"Admitting the common hypothesis, that food is requisite to sustain human life, there follows the necessity for another admission, in the opposite direction,—namely, that food has power to destroy life, through its deficiency or excess, in quality or quantity. This is a specimen of the ambiguous character of all material health-theories. They are self-contradictory and self-destructive,—'a kingdom divided against itself, that is brought to desolation.' If food preserves life, it cannot destroy it. The truth is, food does not affect the life of man; and this becomes self-evident when we learn that God is our only life. Because sin and sickness are not qualities of Soul or Life, we have hope in immortality; but it would be foolish to venture beyond our present understanding, foolish to stop eating, until we gain more goodness and a clearer comprehension of the living God. In that perfect day of understanding, we shall neither eat to live, nor live to eat."

When they dispense with food because "mortal mind" is under the influence of an illusion concerning it,—absurdly supposing "that food supports life,"—and continue to live with the accidents of the human body sustained entirely by the divine "substance" of which they speak, they will furnish a demonstration which will utterly destroy every remaining illusion of mortal mind. But so long as they eat, they are either voluntarily perpetuating an illusion, or demonstrating that they are wrong in their notions. If they are in such a low stage as to be compelled to eat when it would not be necessary if they were in a higher plane, they may, for the same reason, be compelled to use drugs.

Second Test. They deny that drugs, *per se*, as taken into the human system, have any power.

"Christian Science divests material drugs of their imaginary power. . . . The uselessness of drugs, the emptiness of knowledge, the nothingness of matter and its imaginary laws, are apparent as we rise from the rubbish of belief to the acquisition and demonstration of spiritual understanding. . . . When the sick recover by the use of drugs, it is the law of a general belief, culminating in individual faith that heals, and according to this faith will the effect be."—EDDY.

Surely the mind needs healing that could invent the following absurdity:

"The not uncommon notion that drugs possess absolute, inherent curative virtues of their own involves an error. Arnica, quinine, opium, could not produce the effects ascribed to them except by imputed virtue. Men think they will act thus on the physical system, consequently they do. The property of alcohol is to intoxicate; but if the common thought had endowed it simply with a nourishing quality like milk, it would

produce a similar effect. A curious question arises about the origin of healing virtues, if it be admitted that all drugs were originally destitute of them. We can conceive of a time in the mental history of the race when no therapeutic value was assigned to certain drugs, when, in fact, it was not known that they possessed any. How did it come to pass that common thought, or any thought, endowed them with healing virtue, in the first place? Simply in this way: Man finding himself unprotected, and liable to be hurt by the elements in the midst of which he lived, forgot the true source of healing, and began to seek earnestly for material remedies for disease and wounds. The desire for something led to experiments; and with each trial there was associated the hope that the means applied would prove efficacious. Then what was at first an earnest hope came at length to be a belief; and thus, by gradual steps, a belief in the contents of the entire pharmacopœia was established."—MARSTON.

It is true that in many cases the effect of a medicine is to be attributed entirely to the imagination, or to the belief that it will have such and such effects; but the statement of such extreme positions as these shows the irrationality of the theories upon which they are based. According to the above, if it were generally believed that alcohol were unintoxicating and nourishing and bland, as milk, it would be an excellent article with which to nourish infants; and, on the other hand, if it were generally believed that milk were intoxicating, all the influences of alcohol would be produced upon those who drank it. If the public could only be educated to believe alcohol to be nourishing, the entire mammalian genus might be nursing their offspring upon alcohol with equally good results. No insane asylum can furnish a more transparent delusion.

That drugs produce effects upon animals has been demonstrated beyond the possibility of contradiction, and that, too, when the animals did not know that they were taking drugs; and small doses have produced not the slightest effect, while large doses—the animals in each case not knowing that they were taking medicines—have produced great effect, and do so with uniformity. Also the effect of medicines upon idiots and unconscious infants is capable of exact demonstration.

Allied to the effect of drugs is that of *poisons*, almost every drug having the effect of a poison if taken in excess. Some poisons, however, are of such a character that the smallest possible dose may be attended with fatal results. In the case of animals, poisons introduced into the system without the knowledge of the animals do their work effectually. Strychnine carefully introduced into a piece of meat so small that a cat will swallow it whole, will in a very short time show its effects. The instinct of the animal will cause its rejection if there be the slightest possibility of perceiving it; but if sufficient means be taken to keep the animal from knowing that it is

taking anything except meat, it will swallow the meat, and the poison will do its work.

These facts are admitted by the advocates of Christian Science and Mind Cure, and the absolute lunacy of their theories is seen in the manner in which they attempt to account for the effects.

"If a dose of poison is swallowed through mistake, the patient dies, while physician and patient are expecting favorable results. Did belief cause this death? Even so, and as directly as if the poison had been intentionally taken. . . . The few who think a drug harmless, where a mistake has been made in the prescription, are unequal to the many who have named it poison, and so the majority opinion governs the result."—EDDY.

"It is said that arsenic kills; but it would be very difficult for any one to prove how it kills; since persons have had all the symptoms of arsenic poisoning without having taken any arsenic; and again, persons have taken arsenic and did not die. . . . Suppose you take a child that knows nothing about arsenic, and administer the usual dose, the child will probably die, but I will show you that the arsenic was not the cause of the death. . . . Here you may say, 'What had the life of the child to do with the action, the child not knowing anything about arsenic?' We will admit that the child was ignorant of the nature of the poison, but all who are educated in physiology and materia medica know that it kills, therefore the thought, although unconscious to the child, was hereditary in its life. It is, indeed, a universal thought admitted as a fact in every life or soul. A thought is a product of life and is action, and this thought, produced and accepted by life, acts upon the life of the child and produces unconsciously a confusion therein. This confusion produces a fear; this fear in the child's life heats the blood and causes the first conscious action."—ARENS.

"The effects of various experiments, with chemicals and medicine, upon cats and dogs, are studied most minutely by distinguished scientific men, and the results witnessed published to the world with a presumption of wisdom and profundity of learning that carry the conviction to most minds that the properties of such drugs, and their effects upon the *human system*, have been forever established. And *Materia Medica* falls back upon these so-called demonstrations of Science as absolutely indisputable proofs of its Theories. Now it never seems to have occurred to them that all the effects witnessed of such experimenting might be accounted for on the basis of *Thought*, and with the view of investigating the subject to establish a totally opposite explanation; and to show that Mind acting on Matter could account for all their facts, the following experiments have been recently made: The object of the experiments was a dog, a noble thoroughbred, of great sagacity and intelligence. The first experiment consisted in conveying commands to him entirely through *mind*. Not a word was *spoken*, but his mistress would say to him *mentally*,—'Carlo, come here,' or 'Carlo, lie down,' and although the *thought* might have to be repeated mentally a number of times, yet it would reach him, and sometimes he would respond almost immediately. Second experiment: One day his master discovered an appearance to which he gave the name *Mange*. All the dogs around were having it. It was catching,—Dr. So-and-So had pronounced it mange, and prescribed a mixture of Sulphur and Castor Oil, etc., which was to be applied *externally* in such a way that Carlo, in attempting to remove the preparation with his tongue, would get a dose into his system. But here the mistress interposed, and insisted that Carlo should be subjected wholly to mental treatment. The result was entirely satisfactory. The appearance vanished as it came. Again the experiment of placing Carlo entirely under the intelligence of his master's

mind and thoughts for a certain period was tried, and compared with the effects of leaving him wholly under his mistress's mind. In the former case he soon exhibited every symptom of dyspepsia and indigestion in every form to which the master was subject, and in a very marked degree. But under the thought of the mistress, every symptom and appearance vanished at once. He soon attained a perfection of physical condition which constantly attracted the notice of every one. Experiments of this kind were carried much farther, and can be by any one who wishes to test the matter for themselves. In all the instances just mentioned, the physical condition of the dog responded to the mind under whose influence it chanced to be. Love and fear (*sympathy and fear*) are the most marked characteristics of the animal mind. The instances are innumerable where the instinct of the animal surpasses the reason of man in detecting the kindly thought, or the thought of harm, toward itself. When a scientific experimenter gives a drug to a dog, it is done with a perfect certainty in his mind that disorder, derangement of the system, suffering, etc., in some form or another, are sure to follow. A fear corresponding to the thought of the man instantly seizes upon the dog, and various results do follow. The experimenter notes them down and then proceeds to try his drug on dog number 2, all the while holding in his mind an image of the results of experiment number 1, expecting to see similar results. In all probability he sees them." — STUART.*

Third Test. Extraordinary accidents to the body. Whatever may be said of the power of thought in the production of ordinary disease, the effects of accidents to persons who are entirely unconscious when they occur, as the sleeping victims of railroad disasters, are facts which, if they do not terminate human life at once, require the aid of surgery.

Mrs. Eddy says:

"The fear of dissevered bodily members, or a belief in such a possibility, is reflected on the body, in the shape of headache, fractured bones, dislocated joints, and so on, as directly as shame is seen in the blush rising to the cheek. This human error about physical wounds and colics is part and parcel of the delusion that matter can feel and see, having sensation and substance."

It is confessed, however, that very little progress has been made in this department:

"Christian Science is always the most skillful surgeon, but surgery is the branch of its healing that will be last demonstrated. However, it is but just to say that I have already in my possession well-authenticated records of the cure, by mental surgery alone, of dislocated hip-joints and spinal vertebrae."

But records, to be well authenticated, require more than an assertion. And the records may be authentic, and what they contain may never have been thoroughly tested. As they affirm that "bones have only the substance of thought, they are only an appearance to mortal mind"; and if their theories be true at all, they should be able to rectify every result of accident to

the body as readily and speedily as diseases originating within the system.

Fourth Test. Insanity. It is a well established fact that blows upon the head produce insanity. It is equally well established that surgery in many cases is able to remove the difficulty by an obviously physical readjustment, where the surgeon himself cannot be positive what the effect will be until after the experiment, and the victim has no knowledge whatever upon the subject. During the late war, a negro was wounded in the head by the explosion of a shell. He wandered about for several years, to all appearance a driveling idiot, when certain surgeons took an interest in his case, and concluded that the removal of a piece of the skull which had been driven in and pressed upon the brain, might restore his reason. Knowing that no damage could be done to his mind by the operation, they performed it, and were almost appalled when, after the lapse of so many years, as they lifted the piece of skull and removed the pressure upon the brain, the light of intelligence returned to the eye of the man, who said, "We were at Manassas yesterday; where are we to-day?" A similar case, where there had been delirium alternating with coma for a week, occurred in March last.

The transient effect of stimulants upon persons who have been in a state of dementia apparently for a long time, is also well known.

Mrs. Eddy upon this subject directs practitioners to tell the moderately sick man,

"that he suffers only as the insane suffer, from a mere belief. The only difference is that insanity implies belief in a diseased brain, while physical ailments (so called) arise from belief that some other portions of the body are deranged. . . . The entire mortal body is evolved from mortal mind. A bunion would produce insanity as perceptible as that produced by congestion of the brain, were it not that mortal mind calls the bunion an unconscious portion of the body. Reverse this belief, and the results would be different."

It may be readily admitted that if a man believed his mind was in his foot, and believed it was out of order, he might be crazy. But in selecting the bunion for an illustration, Mrs. Eddy was not so wide of the mark as she might have been. Nearly twenty years ago, while listening to the lectures of Dr. C. E. Brown-Séquard, before the physicians of Brooklyn, I heard him give the following case: A youth (fourteen years old) went to bed perfectly sane, nor had he ever had a symptom of insanity. The next morning when he arose and stepped upon the floor he became a maniac. With great difficulty he was replaced

* Mrs. Stuart in the foregoing passage is only a little more absurd than Mrs. Eddy. "The preference of mortal mind for any method creates a demand for it, and the body seems to require it. You can even educate a healthy horse so far in physiology that he will take cold without his blanket, whereas the wild animal, left to his instincts, sniffs the wind with delight." The connection of this

quotation with what goes before shows that the horse does not take cold, in the opinion of Mrs. Eddy, because, having been accustomed to the blanket, his system is so weakened that he will take cold without it; but because the training of the said horse has been such that he is led to believe that if the blanket is not on he will take cold!

upon the bed, and the moment he touched it he was sane. During the morning he made several attempts to rise, always with the same result. A physician was called, who in his account of the case says: "When sitting up in his bed he drew on his stockings; but on *putting his feet on the floor and standing up, his countenance instantly changed, the jaw became violently convulsed,*" etc. He was pushed back on the bed, was at once calm, looked surprised, and asked what was the matter. Inquiry showed that he had been fishing the preceding day, but had met with no accident. His legs were examined minutely, but nothing unusual was seen; but, says the physician, "*On holding up the right great toe with my finger and thumb to examine the sole of that foot, the leg was drawn up and the muscles of the jaws were suddenly convulsed, and on releasing the toe these effects instantly ceased.*" After further experiment, an irritated point, so small as to be scarcely visible, was taken away by the cutting of a piece of skin, and "the strange sensation was gone and never returned." *

Post-mortem examinations which exhibit the degeneration of the brain structure are of no importance in the eyes of these professors of dreams.

Fifth Test. The perpetuation of youth and the abolition of death should also be within the range of these magicians.

Baldwin, of Chicago, says:

"Man should grow younger as he grows older; the principle is simple. 'As we think so are we' is stereotyped. Thoughts and ideas are ever striving for external expression. By keeping the mind young we have a perfect guarantee for continued youthfulness of body. Thought will externalize itself; thus growing thought will ever keep us young. Reliance on drugs makes the mind, consequently the body, prematurely old. This new system will make us younger at seventy than at seventeen, for then we will have more of genuine philosophy."

Mrs. Eddy meets this matter in the style of Jules Verne:

"The error of thinking that we are growing old, and the benefits of destroying that illusion, are illustrated in a sketch from the history of an English lady, published in the London 'Lancet.' Disappointed in love in early years, she became insane. She lost all calculation of time. Believing that she still lived in the same hour that parted her from her lover, she took no note of years, but daily stood before the window, watching for his coming. In this mental state she remained young. Having no appearance of age, she literally grew no older. Some American travelers saw her when she was seventy-four, and supposed her a young lady. Not a wrinkle or gray hair appeared, but youth sat gently on cheek

and brow. Asked to judge her age, and being unacquainted with her history, each visitor conjectured that she must be under twenty."

That the above should be adduced as proof of anything would be wonderful if the person adducing it had not previously adopted a theory which supersedes the necessity of all demonstration. It is important to notice that if the belief had anything to do with it, this amazing result grew from the belief in a falsehood. She did *not* live in the same hour that parted her from her lover; she believed that she did, and, according to Mrs. Eddy, this belief of a falsehood counteracted all the ordinary consequences of the flight of time.

But the delusion among the insane that they are young, that they are independent of time and of this world, is very common; and the most painfully paradoxical sights that I have ever witnessed have been men and women, toothless, denuded of hair, and with all the signs of age,—"*sans teeth, sans eyes, sans taste, sans everything,*"—some of them declaring that they were young girls and engaged to be married to presidents and kings and even to divine beings. These delusions in some instances have been fixed for many years. Having had an official connection with an insane asylum for two years, I had more opportunities than were desired for conversing with persons of this class.

In the case adduced by Mrs. Eddy, granting it to be true, and admitting that the state of the mind may have had some effect, it is of no scientific importance; for the number who show no signs of age until fifty, sixty, or even seventy years have passed, is by no means small in the aggregate; we meet them everywhere. One of the most astute observers of human nature, himself a physician, solemnly warned a gentleman that if he continued to sleep only four hours out of twenty-four, he would die before he was fifty years of age. "What do you suppose my age to be now?" said the gentleman. "Thirty," said the physician. "I am sixty-nine," was the reply, which proved to be the fact.

Mrs. Eddy, not content with this case, continues: "I have seen age regain two of the elements it had lost, sight and teeth. A lady of eighty-five whom I knew had a return of sight. Another lady at ninety had new teeth,—incisors, cuspids, bicuspid, and one molar." Such instances as these are not uncommon, but are generally a great surprise to the persons

* This case can be found (No. 44) in "Lectures on the Physiology and Pathology of the Central Nervous System," by Brown-Séquard; published, 1860, in Philadelphia. Also in Holmes's "Annals of Surgery," vol. 3, p. 330.

A similar account can be found on insanity produced

four years after a boy trod on a piece of glass, which was entirely relieved by removing from a point near the ball of the big toe a trifling piece of glass. What is called the nervous temperament or condition is of importance.

themselves, and unconnected with any delusion as to the flight of time. They are simply freaks of nature.

There is a flattening of the eye which comes on with advancing years, and necessitates the use of glasses. Many persons who have few signs of age, retain the color of the cheek, have lost no teeth, and whose natural force is not abated, find that their eyes are dim. According to these metaphysical healers this is not necessary, but I have observed that a number of them say nothing about being themselves compelled to use glasses.

Much is made of one case of a metaphysical healer, who, after using glasses fifteen years, threw them away, and can now read even in the railroad cars without them. Such cases of second sight have occurred at intervals always, and under all systems, and sometimes when the progress of old age had been so great that the persons had suffered many infirmities, and had but a few months left in which to "see as well as ever they did in their lives."

Some famous actors and actresses, without the use of pigments, dyes, or paints, and notwithstanding the irregular hours and other accidents of their professional life, have maintained an astonishing youthfulness of appearance down to nearly three-score years and ten.

John Wesley at seventy-five, according to testimony indubitable and from a variety of sources, not only presented the appearance of a man not yet past the prime of life, but, what is more remarkable, had the undiminished energy, vivacity, melody and strength of voice which accompany youth. Nor at eighty-five had he exhibited much change. In the city of Chicago there resides a professional man nearly seventy years of age, whose teeth, complexion, color, hair, voice, and mind show no signs of his being over forty-five years of age. Henry Ward Beecher, the January before his death, could write to his oldest brother that he had no rheumatism, neuralgia, sleeplessness, or deafness, was not bald, and did not need spectacles.

Meanwhile it is impossible not to suppose that the case as described by Mrs. Eddy has been greatly exaggerated. That some Americans who saw her at the age of seventy-four supposed her to be under twenty, is to be taken "*cum grano salis*."

As for death, if the theories of these romantic philosophers be true, it should give way; if not in every case, at least in some. It is said that there are hundreds of persons in Boston who believe that Mrs. Eddy will never die. Joanna Southcott, who arose in England in 1792, made many disciples, by some estimated at one hundred thousand, who believed that she would never die; but unfortunately

for their credulity she succumbed to the inevitable decree.

Sixth Test. It might be easily shown, also, that if these theories are true, clothes, so far as sustaining warmth and life are concerned, are superfluous, and that fire itself is unnecessary.

CONCLUSION.

IN endeavoring to ascertain the causes of the recoveries which undoubtedly occur when the patient is under the supervision of Christian Scientists and Mind Curers, it would be a blunder to omit the testimony of Mrs. Eddy as to her experiments with homeopathy. She says that she has attenuated common table salt until there was not a single saline property left; and yet with one drop of that in a goblet of water, and a teaspoonful administered every three hours, she has cured a patient sinking in the last stage of typhoid fever. Describing a case of dropsy given up by the faculty, she says that after giving some medicines of high attenuation, she gave the patient unmedicated pellets for a while, and found that she continued to improve. Finally she induced the patient to give up her medicine for one day, and risk the effects. After trying this, she informed Mrs. Eddy that she could get along two days without the globules; but on the third day had to take them. She went on in this way, taking unmedicated pellets, with occasional visits from Mrs. Eddy, and employing no other means was cured. Thus Mrs. Eddy says she discovered that mind was potent over matter and that drugs have no power.

It is not to be inferred from the above that homeopathic remedies, which have been modified by the discoveries made and the experience attained since the time of Hahnemann, are generally powerless. That question is not essential to this inquiry. But the confession of Mrs. Eddy that her experiments were the means of teaching her that mind and not matter effects the cure, will be regarded by all who do not accept her theories as containing the principal key to the problem. She made the common error of generalizing from a few particulars, and ever since has endeavored to test facts by theory instead of making facts the test. Because she found a supposed mental cause adequate to a cure in a few cases, she leaped to the wild conclusion that all causes are mental. Yet it would be an error to lose sight of the specific elements in the practice of Christian Science and the various forms of Mind Cure as a profession.

The patients who are treated by these practitioners have, to begin with, the *vis medicatrix nature*, which is the final element in every cure, known and recognized to be such by the

leaders of the medical profession for a long period of time. Sir John Forbes, M. D., one of the most eminent regular physicians of England, says of the regular practice in his famous article on homeopathy:

"First, that in a large proportion of the cases treated by allopathic physicians, the disease is cured by nature, and not by them. Second, that in a lesser but still not a small proportion, the disease is cured by nature in spite of them; in other words, their interference retarding instead of assisting the cure. Third, that in, consequently, a considerable proportion of diseases it would fare as well or better with patients if all remedies—at least all active remedies, especially drugs—were abandoned."

Even so long ago as Sydenham's time, he said, "I often think more could be left to Nature than we are in the habit of leaving to her; to imagine that she always wants the help of art is an error and an unlearned error too."

Sir John Marshall, F. R. S., in opening the session of the London University Medical School in 1865, said,

"The *vis medicatrix naturæ* is the agent to employ in the healing of an ulcer, or the union of a broken bone; and it is equally true that the physician or surgeon never cured a disease; he only assists the natural processes of cure performed by the intrinsic conservative energy of the frame, and this is but the extension of the force imparted at the origination of the individual being."

Under the Mind Cure this force of nature is still at work, and in the great number of self-limited diseases which tend to recovery, it is left free from all error of practitioners. If it loses any advantages which the introduction of the proper drugs might give, it is saved from the consequences of the administration of the wrong ones.

The number of instances in which the prescriptions interfere with nature is so great that Dr. Paris wrote, many years ago, "The file of every apothecary would furnish a volume of instances where the ingredients of the prescription were fighting together in the dark." This is especially true of the diseases of children. The late Dr. Marshall Hall said, "Of the whole number of fatal cases of diseases in infancy, a great proportion occur from the inappropriate or undue application of exhausting remedies."

Further, those who are treated by the Mind Curers in many cases derive benefit from the freedom of diet, air, and exercise allowed. They are told to pay no attention to symptoms, think nothing whatever about their diseases, and not talk about them; to eat, sleep, drink, and act as nearly as possible as if they were well; and in a large majority of chronic diseases, this is all that is needed to produce a return to health.

They have also the benefits of faith and imagination; as they are taught to imagine healthy,

vigorous organs, and their whole bodies in the condition of health, and with such mental pictures to drive away all consciousness of symptoms, they summon to their aid that most potent of all influences, a calm and fearless mind. The presence of the practitioner and her methods greatly contribute to this calming influence.

"She enters with a cheerful air and, without taking your hand or approaching your bed, seats herself and asks you to tell her all your symptoms. [She may, however, belong to the class which will not allow any description of symptoms.] She receives your budget of ailments calmly, without one expression of sympathy, for she has none, considering all your maladies as an illusion or dream from which it is her divine mission to awaken you. You are made to feel, immediately, that there is little of consequence in all that you have been telling her. She then relapses into a silence of ten or fifteen minutes, in which her kind face wears a resolute expression, making it almost stern. . . . After this silent treatment she speaks to you in the most encouraging manner, endeavoring to call you away from yourself to the contemplation of spiritual truth."

A point of difference between the Faith Healers and Mind Curers is worthy of observation. The Faith Healers require the patient to have faith; the Mind Curers make a boast of the fact that faith is not necessary. A close analysis, however, shows that this boast is vain. Before they are sent for there is usually some faith, and often much, combined with a distrust of other systems. This was, as some of their authorities affirm, the case when they began. Sufficient time has elapsed to develop a constituency who employ no other methods. If there were no faith, there must be a distrust of other forms of practice, or there would be no reason for turning to the new. Where there is no faith on the part of the patient, usually his friends believe, and have induced him to make the experiment. Thus he is surrounded by an atmosphere of faith which is so important that all the writers attach great weight to it.

"Friends and attendants who are believers in Mental cure, and know what sort of a mental atmosphere is favorable to restoring health, may do much to help the metaphysician in his work. But, unfortunately, this is seldom the case; and the friends are usually ignorant on the subject, and innocently burdening the invalid with just that kind of hurtful sympathy which keeps him under a cloud of depression. When such is the case, their absence is more helpful than their presence, and it is desirable to be alone with the patient while treating him."—MARSTON.

Some go even so far as to say that they should be, if possible, removed from the society of those who do not believe.

But a favorable atmosphere exists to some extent among those who have induced an unbelieving invalid to send for a mental healer. Assuming that the healer has arrived, it is easy to see how faith is engendered. She takes her seat, and after a few unimportant questions becomes silent. The thoughts that wander

through the mind of the invalid, as told me by a patient of thorough intelligence, an alumnus of one of the first universities of this country, were such as these: "Can there be anything in this? I don't believe there is, and yet a great many people are believing in it, and some most wonderful cures have taken place. There is Mrs. ———. I *know* that she was given up to die by our best physicians, and I *know* that she is well." Then the eye will wander to the face of the metaphysician, who seems looking at far-off things and wrestling with some problem not yet solved, but of the certainty of the solution of which she has no doubt. Sometimes the practitioners cover their eyes, and this in many temperaments would add to the effect. The fifteen minutes pass and leave the unbeliever passive, as a quotation in a former part of the article describes it, "less cantankerous."

The encouraging words of the healer on departing are not without effect, differing as they do from the uncertain or the preternaturally solemn forthgivings, or the ill-concealed misgivings, of many ordinary physicians. There are no medicines to take, no symptoms to watch, and only the certainty of recovery to be dwelt upon. Whatever the appetite calls for is to be eaten without anxiety as to the consequences, and if there be no appetite there is to be no eating and no anxiety as to the result of abstinence.

The effect of the treatment having been pleasant, the patient rather longs than otherwise for the next day to come, and the next. If the disease be one that under ordinary circumstances would require an operation, the dreadful image of the surgeon's knife no longer appalls the patient's mind. The invalid discovers that he does not die, that he sleeps a little better; certainly he is not aroused to take medicine, and there is no fear that he will take cold; he feels decidedly better at the next visit, and now faith is not only born, but turned into sight. His friends assure him that he is better, and he tells them that he is so.

Perhaps the most potent cause in awakening faith is the sublime audacity displayed by the practitioner who dares to dispense with drugs, manipulation, hygiene, prayer, and religious ceremony. That spectacle would infallibly produce either such opposition and contempt as would result in the termination of the experiment, or faith. It is impossible to be in a negative position in its presence, where the responsibilities of life and death are assumed.

As for "absent treatments," these are based on the theory that to think of another entirely and abstractedly occasions a spiritual presence of that other. "Distance is annihilated, and his living image and inner personality seem to

stand before us, and what we say to it we say to him."

These persons catch up and incorporate with their theories the as yet immature investigations of the Society for Psychical Research, in which it is claimed that a sensitive subject can form in the mind a distinct mental picture or idea of words and letters which had been in the mind of an agent. Healers endeavor to extend those phenomena so as to make them annihilate space; and, according to them, "it is as easy to affect a person in the interior of Africa by a mental influence, as in the same room." Here they affiliate with the whole mass of superstitions which accumulated in the early history of the human race, and reappear in certain temperaments in each generation. Whether such a thing as thought-transference exists, there is not space here to inquire; nor is it necessary, for the effects of the "absent treatment," so called, can all be accounted for without any such assumption.

The patients thus treated *know* or they do *not* know that they are being treated. When they know, there is nothing to explain, for it is the same as if the patient and practitioner were in each other's presence. All the mental operations, as well as the original force of nature, proceed under the conviction that they are being treated by a mental healer. If they do not know, the entire field of coincidence and the *vis medicatrix naturæ* remain inviolate; and to determine that there is any connection between the alleged treatment and the change in the condition of the patient would require a vast number of cases and detailed coincidence of time and symptom, for which these practitioners do not display ability, and for which, on their own testimony, they have had no opportunity. Indeed, their theories are such as to make all investigation superfluous and tedious.

The case upon which Mrs. Eddy appears to rely is described thus: "The day you received my husband's letter I became conscious for the first time in forty-eight hours." What can this prove? What evidence is there that she would not have become conscious if the letter had never been written? If she were ever to come out of an unconscious state and recover, it must be at some time. The coincidence of Mrs. Eddy's receiving a letter from the husband does not show any connection between the two facts, for such letters have been sent and the patients have died. To my personal knowledge her treatments have failed, and her predictions have not been fulfilled, the patient dying in excruciating agony. Instances which have occurred, and can be reproduced at any time, of the attempted absent treatment of persons *who never existed*, are numerous; for

there is not one of this-class of healers that cannot be so imposed upon. This is sufficient to raise a powerful presumption that the spiritual presence which they evoke, and to which they speak, is "such stuff as dreams are made of."

It is not to be denied that they make many cures, more than any bungler or extremist of any school using drugs would expect. But their failures are numerous, and, like the faith healers, they never publish *these*. Compelled, however, to admit this, the chancellor of the University of the Science of Spirit says:

"Our inability to heal instantaneously as they (Jesus and the Apostles) are recorded to have done, is attributable to our deficiency in the realization of the doctrine. While we claim that our theory of healing is applicable to all diseases, we do not claim to possess sufficient understanding in it at the present time to heal all diseases instantaneously, neither would we now guarantee to cure certain diseases, such as cancer or consumption in the last stages. Of one thing, however, we are confident, *i. e.*, that we can do more good in all cases of illness than can be done with any other theory, or with *materia medica*."—ARENS.

They are rather more successful than the faith healers for this reason: with the faith healers it is generally either an instantaneous cure, or none at all. And an instantaneous cure cannot be made to apply to a great many cases, and what is supposed to be such is very frequently a delusion followed by a complete relapse. The Christian Scientists, however, and their congeners make many visits and give nature a much better opportunity without the destruction of the patient's faith in them by a failure at a critical juncture; thus it happens that the proportion of recoveries is more numerous.

The principal practical element has been more or less recognized and employed by the greatest physicians of every school through the whole history of medical practice, as well as by quacks and superstitious pagan priests. "The History of Medical Economy during the Middle Ages," by George F. Fort, contains numerous illustrations of this subject, though adduced for another purpose, and, unlike many other treatises, giving the authorities with the most painstaking accuracy.

Dr. Rush, of whom Dr. Tuke says that few physicians have had more practical experience of disease, says:

"I have frequently prescribed remedies of doubtful efficacy in the critical stage of acute diseases, but never till I had worked up my patients into a confidence bordering upon certainty of their probable good effects. The success of this measure has much oftener answered than disappointed my expectations."

The "British and Foreign Medical Review" for January, 1846, whose editor was Sir John Forbes, contained an article written by himself which encourages "the administration of

simple, feeble, and altogether powerless, non-perturbing medicines, in all cases in which drugs are prescribed *pro forma*, for the satisfaction of the patient's mind, and not with the view of producing any direct remedial effect."

"Physic and Physicians," published in 1839, speaking of the celebrated and extraordinarily successful Dr. Radcliffe, who died in 1714, and was the founder of the Radcliffe Library at Oxford University, says that he paid particular attention to the mind of the patient under his care, and had been heard to say that he attributed much of his success and eminence to this circumstance. There is a very good anecdote illustrating his views upon this subject:

"A lady of rank consulted Radcliffe in great distress about her daughter, and the doctor began the investigation of the case by asking, 'Why, what ails her?' 'Alas! doctor,' replied the mother, 'I cannot tell; but she has lost her humor, her looks, her stomach; her strength consumes every day, and we are apprehensive that she cannot live.' 'Why do you not marry her?' said Radcliffe. 'Alas! doctor, that we would fain do, and have offered her as good a match as ever she could expect.' 'Is there no other that you think she would be content to marry?' 'Ah, doctor, that is that troubles us; for there is a young gentleman we doubt she loves, that her father and I can never consent to.' 'Why, look you, madam,' replied Radcliffe gravely, 'then the case is this: your daughter would marry one man, and you would have her marry another. In all my books I find no remedy for such a disease as this.'"

This principle has also been employed by certain priests and clergymen of every sect. A young woman, a teacher, was, as she believed and as her friends supposed, at the point of death. Her physician was not quite certain that she was as ill as she seemed, and requested the pastor to assist him in breaking up her delusion that she must die. He attempted it, but she refused to hear him, and loaded him with messages for her friends, and especially for her class in the Sunday School. As he was about to bid her farewell, he said that he would return in the afternoon; she said that she would like him to pray with her, but that it was useless to pray for her recovery. Having in view her hearing what he had to say, he prayed in such a way as to break the spell and make her believe that she would recover; as he did this, the morbid symptoms of approaching death gave way, and she is still living.

Another case was still more remarkable. A woman, ill and bedridden, conceived a high regard for the piety and intelligence of her pastor. He entered her room and in a loud and solemn voice said, "I command you to arise!" Involuntarily she arose and resumed the duties of housekeeping, which after the lapse of ten years she still performs.

A Roman Catholic priest, of high position

in his church, told the writer that he thought he had saved scores of lives by refusing to administer the Sacrament of Extreme Unction, which led the patients to say "Father — does not think I am going to die."

In 1832, when the cholera raged in Norfolk, Virginia, Dr. Buzzell, a physician of great local celebrity, lived there. He was driving night and day, and on one occasion was summoned to see a stalwart negro who was apparently in the state of collapse. Instead of beginning at once to medicate him, he accused him of shamming, denounced and derided him in every possible way for calling him when he was at work night and day, driven almost to death. Then, putting on the appearance of intense excitement, he procured a switch and began to thrash the negro very severely. The more he groaned, and the more he said he was dying, the more Dr. Buzzell thrashed him, and with his threatenings and beatings brought on such a tremendous reaction that the man recovered.

In a visit to a branch of the Oneida Community at Wallingford, in 1856, I asked Mrs. Miller, the sister of John H. Noyes, the founder of the community, what they did if any of the inmates became ill, as they repudiated medicines. She said they had very little sickness. "But, have I not heard of an epidemic of diphtheria among you?" She said there had been, but by their treatment they saved every case. "What was that treatment?" "It was treatment by criticism." "How was it applied?" "So soon as a person was taken ill, a committee was appointed who went into the room and sat down, paying no attention to the patient; they began at once to speak about him or her, criticising the patient's peculiarities, bringing every defect to the surface, and unsparingly condemning it." Mrs. Miller added that no one could endure this more than an hour. The mental and moral irritation was so great that they began to perspire and invariably recovered. The universal efficacy of this method may well be doubted, for many persons live in such an atmosphere that if that treatment would save them, they would never die; while others are so callous to all criticism that the remedy would be without effect.

The nervous "temperament" or condition of the healer appears to be of no special importance; that is, it is of importance only in the same sense that it is to salesmen, pub-

lic speakers, school teachers, lawyers, sea captains, detectives, military leaders, physicians, and all who impress themselves upon others. I have seen successful healers thin and tall; others short and fat; some pale, others florid; some intelligent, others unintelligent; some intellectual, more only intelligent; some in good health, others diseased; one of the best was so feeble as to seem on the verge of death.*

The specimen mental treatment given on page 423 shows how the practitioner worked herself up to the point; and it is easy to fancy how forcibly she spoke when a surge of conviction that seemed to act on all the blood-vessels of her body and made her tingle all over, went through her; and it is equally easy to imagine the effect upon the patient.

The relation of the Mind Cure movement to ordinary medical practice is important. It emphasizes what the most philosophical physicians of all schools have always deemed of the first importance, though many have neglected it. It teaches that medicine is but occasionally necessary. It hastens the time when patients of discrimination will rather pay more for advice how to live, and for frank declarations that they do not need medicine, than for drugs. It promotes general reliance upon those processes which go on equally in health and disease.

But these ethereal practitioners have no new force to offer; there is no causal connection between their cures and their theories.

What they believe has practically nothing to do with their success. If a new school were to arise claiming to heal diseases without drugs or hygiene, or prayer, by the hypothetical odyllic force invented by Baron Reichenbach, the effects would be the same, if the practice were the same.

Recoveries as remarkable have been occurring through all the ages, as the results of mental states and nature's own powers.

They will not be able to displace either the skilled surgeon or the educated physician; for their arrogant and exclusive pretensions are of the nature of a "craze." Most sensible persons will prefer a physician who understands both the mind and the body; who can be a "father confessor" to the sick man, relieving him of the responsibility of treating himself, quieting his mind, strengthening him by hope, and stimulating him by his personal presence; one who, understanding the mineral, plant,

* "In practice it seems to be more difficult to successfully treat one's self than to treat another person. The reason for this is that, when personally under the influence of supposed disease, the appeal of the senses is more forcible than when the deception shows itself in another. But that one can conquer the results of his own inverted thinking, there is not the slightest

occasion to doubt. . . . We must not, however, make the mistake of supposing that he who would attempt to bring healing to others must first be sound himself. . . . The effect of a treatment depends not on its length, but on the condition of the healer who exercises it, and the dynamic power of the thought exerted."—MARSTON.

and animal substances included in the *materia medica*, can assist nature, interfering only when absolutely necessary and certainly safe; too learned and honest, when not knowing what to do, ever to do he knows not what.

They will also prefer a physican who can relieve their pains when incurable, smooth their pathway to the inevitable end, or, when he has the happiness to see them convalescent, will be able to give them such hygienic hints as may prevent a recurrence of the malady, or save them from something worse.

The verdict of mankind, excepting minds prone to vagaries on the borderland of insanity, will be that pronounced by Ecclesiasticus more than two thousand years ago :

"THE LORD HATH CREATED MEDICINES OUT OF THE EARTH; AND HE THAT IS WISE WILL NOT ABHOR THEM. MY SON, IN THY SICKNESS BE NOT NEGLIGENT; BUT PRAY UNTO THE LORD, AND HE WILL MAKE THEE WHOLE. LEAVE OFF FROM SIN, AND ORDER THY HANDS ARIGHT, AND CLEANSE THY HEART FROM ALL WICKEDNESS. THEN GIVE PLACE TO THE PHYSICIAN, FOR THE LORD HATH CREATED HIM: LET HIM NOT GO FROM THEE, FOR THOU HAST NEED OF HIM. THERE IS A TIME WHEN IN THEIR HANDS THERE IS GOOD SUCCESS. FOR THEY SHALL ALSO PRAY UNTO THE LORD, THAT HE WOULD PROSPER THAT WHICH THEY GIVE FOR EASE AND TO PROLONG LIFE."

J. M. Buckley.

OVER THE HILLS.

"OVER the hills fair pastures lie
Beneath a softer, sunnier sky;
From balmy woods more freshly green
To sweeter songs of birds unseen
The rousèd echoes make reply.

"The men are gentler: there might I
Be happy yet — could I but fly
From this my story's tedious scene
Over the hills!"

O human Child! on this rely:
Over the hills no rarer dye,
No richer bloom, no brighter sheen!
Nothing but this that still hath been:
Space where you still may stand and sigh,
"Over the hills!"

Gertrude Hall.

AN INCIDENT IN THE LIFE OF JOHN ADAMS.

IN the spring-time of 1818, I passed a long afternoon in the company of the second President of the United States and his family in the parlor of his home at Quincy; and on that occasion the patriarch, then three or four years younger than I am now, displayed one side of his character in so strong a light that I am not willing to omit making a record of it.

John Adams had striking faults, and he wore them on the outside, where they could be seen of all men. He writes of his own character with simplicity and unreserve: "I have looked into myself, and I see weakness enough; but I see no timidity, no meanness, nor dishonesty there."

His grandson and biographer counts among his weaknesses, quick temper and talkativeness,

often carried to indiscretion. Jefferson, after a seven months' intimacy with him in London and Paris, writes to Madison: "He is vain, irritable, and a bad calculator of the force and probable effect of the motives which govern men. This is all the ill which can possibly be said of him."

And in the same letter he dwells on the merits of one about eight years his senior: "He is disinterested, profound, accurate in judgment, except where knowledge of the world is necessary to form a judgment, and so amiable that you will love him, if ever you become acquainted with him."

His vanity, it may be added, sometimes showed itself in impatience at the superiority of another; but if he could occasionally write disparagingly of some of his great contemporaries, he has in his moments of reflection scattered along the way honorable tributes to their powers and their services.

As a consequence, the popular imagination has never shaped for itself an image of the man in an idealized form; nor has he as yet nestled himself so closely in the public affection as Jefferson seemed to predict for him; but when the services which he has rendered his country are summed up, he is found to hold a most honorable place among its ablest statesmen.

His political sympathies were, from the morning twilight of our Union, on the side of the people. In the year before the formation of our present Constitution, he wrote:

"It has ever been my hobby-horse to see rising in America an empire of liberty, and a prospect of two or three hundred millions of freemen, without one noble or one king among them. If it is impossible, I would still say, let us try the experiment, and preserve our equality as long as we can."

Industry was his fixed habit: as a lawyer he prepared his cases most thoroughly; and he took this habit with him into public life, greatly to the advantage of his country in his various negotiations. He was brave and fearless, but "his head, his heart, and his hands" were ever "guiltless of the crime of provoking" war.

Human life on earth he held to be a most desirable stage of being, and of his own share in it he says: "It has been sweet and happy on the whole, and calls for gratitude to my Maker and Preserver."

In the early months of 1796, while his nomination for the Presidential chair was as yet uncertain, his mind turned upon other public duties besides those of an executive character. "If I had eloquence, or humor, or irony, or satire, or the harp or the lyre of Amphion, how much good could I do to the world!"

When he doubted his nomination to the Presidency, he turned his mind for consolation to the very course which his son, John Quincy Adams, adopted after defeat as a candidate for reelection. He writes:

"If Mr. Jefferson should be President, I believe I must get up as a candidate for the House. I feel sometimes as if I could speechify among them. If I were in that house I would drive out of it some demons that haunt it. At times there are false doctrines and false jealousies predominant there, that it would be easy to expose."

John Adams did not begin the controversy with Hamilton. In January, 1793, when both Houses were making strict inquisition into the management of the treasury, Adams claims for Hamilton that which is due from a generous nation to a faithful servant. "I presume," he says, "his character will shine the brighter."

Before the close of Washington's Administration John Adams made remarks, which amount to an assertion, that the Constitution was already so perfectly established by Wash-

ington that the system of government introduced by him could not be departed from by any one, whoever it might be, who should be elected his successor. His exact words are: "If Jay or even Jefferson should be the man, the government will go on as well as ever. Jefferson could not stir a step in any other system than that which is begun."

John Adams refused to believe that there was any necessity of a third term of service, as President, by Washington, saying: "There is no more danger in the change than there would be in changing a member of the Senate, and whoever lives to see it will own me a prophet."

Happily for the country, and for the establishment of republican institutions, Washington inflexibly persisted in setting the example of moderation which is needed for the safety of our institutions.

At one time of his life John Adams was in the closest contact with Franklin, whose imperturbable tranquillity of manner fretted the impulsive nature of his younger fellow-laborer. A collision between them took place in Paris, whither Adams repaired with commissions as superb as ever were intrusted to a single diplomatist; for he was made sole minister to form with Great Britain the treaty of peace with the independent United States of America, and the sole minister plenipotentiary from the United States to the same power with the special purpose of forming a treaty of commerce between the two nations. To those commissions were soon added full powers as minister to Holland. The use to be made of these accumulated trusts would be of the very highest importance to his country, and, it may be said, to mankind. The time had not arrived for opening negotiations for peace, which formed one object of his mission; and inactivity was hateful to him. From Paris, where for the moment he had nothing to do, he sent letters to Congress proposing a new and rougher manner of dealing with the government of the king of France, and involved himself in the discussion of questions that more properly belonged to the American legation in France. Congress was thus led to question whether it was wise to intrust to one man the sole negotiation of peace for a country extending so far, and composed of so many States; and it substituted a commission representing the several sections of the country. Accordingly, Adams, the favorite of New England, received as his colleagues Jay and Franklin of the central States, and Laurens of South Carolina. Adams himself has given expression to his exquisite pain at the decrease of his dignity, to which at the moment it was impossible for him to reconcile his feelings; while, as a question of public

policy and interest, he readily acknowledged that Congress had acted wisely. But while he gave the approval of his judgment to the change, he has himself recorded the intensity of his disappointment and mortification; and he could never reconcile his mind to a cordial acceptance of Franklin as his associate in the negotiation, and could never do justice to the services which Franklin rendered in bringing about the peace. Each of the two wrote to Congress of the conduct of the other; but it was certainly John Adams who began the obnoxious representations; Franklin did but avert erroneous impressions which might otherwise have been harmful and abiding. Nor would Adams ever see the wisdom with which Franklin opened the negotiation for peace and carried it forward almost to completion.

In 1818, Andrews Norton, then the librarian of Harvard College, was preparing for the "North American Review" an article on the life and writings of Benjamin Franklin. His own special studies had been those of theology. He was a man of singular purity of mind and integrity of character, reserved in his manners, retreating from general society, and not courting familiar intercourse even with other officers of the university; yet capable of strong attachments, and in his own circle confiding, affectionate, and generous. Moreover, he was the strongest possible assertor of the rights of the individual to absolute freedom of mind, and permitted no one to interfere with his own exercise of the right. He did not surrender his judgment to party prejudices. For example, he treated the character of Jefferson with a candor that was not common among the New England Federalists of that day, and on one occasion publicly vindicated Jefferson's private character against recklessly false aspersions. In his writings he showed more care for the distinct presentment of his own opinions than zeal for making proselytes. The Harvard students of that day gave him the palm as the ablest writer among the younger generation of the Harvard graduates then residing in Cambridge.

At this period of his life he was diligently revolving in his own mind the character and career of Franklin. Various stories adverse to Franklin's conduct in negotiating the treaty of peace in 1783, had from the time of ratification circulated through Massachusetts. The tribute of John Adams to the merits of Franklin in the negotiation was inadequate; but stories unfavorable to Franklin, which passed from one to another, and in the transit had been enlarged and molded into very homely and clear English words of reprobation, were falsely and without any authority attributed to

John Adams. Their total want alike of his authority and of truth was not known, and they still went from mouth to mouth as the emphatic language of John Adams himself. It very naturally and most properly occurred to Andrews Norton, who, ill as he thought of Franklin's character, was too wise to accept rumor as the herald of historic truth, to repair to Quincy and ascertain the conduct of Franklin in the negotiation with Great Britain from the ex-President himself.

One day, in the season preceding the summer of 1818, he invited me to accompany him in an excursion to Quincy. I joyfully accepted the invitation, and we drove across the country from Cambridge to the homestead of John Adams. On the way he detailed to me some of the points most unfavorable to Franklin which had circulated through Massachusetts under the pretended authority of Adams.

We arrived early in the afternoon. The venerable ex-President received us cordially in the parlor of his homestead at Quincy; and so did the wife of his youth, the accomplished woman now known to the world by the publication of two volumes of her own letters, and two more of letters which she received from her husband. Several younger persons, seemingly their grandchildren, came in and went out as occasion served, and it was plain that the aged man was thoroughly well ministered to by youthful attendants whose whole demeanor was marked by reverence and affection. A more respectable or a more lovely family group, of which the head is an octogenarian, can hardly be conceived of.

I was presented as one who before many days was to embark for purposes of study at a German university. With a frankness which did not at all clash with the welcome of my reception, the venerable man broke out in somewhat abrupt and very decisive words against educating young Americans in European schools, insisting, and from a certain point of view very correctly, that a home education is the best for an American.

Mr. Norton soon entered upon the errand on which he came, by leading conversation to the career and character of Franklin. The ex-President listened and answered; but not one single word unfavorable to Franklin fell from his lips. His visitor pushed his inquiries, striving to come nearer to details; but still Adams had not a word of evil to say of his former colleague. With no man in his life had he had so vexatious a rivalry. There at his side sat a scholar of varied culture, in the opening years of manhood, of great ability, a very skillful writer, of the highest repute for integrity of character and fidelity to his convictions, prepared to accept views unfavorable

to the character and statesmanship of Franklin, and through the "North American Review" able to present them to the American public as final truth. But, to every renewed questioning, Adams in his answers steadfastly put the injuries aside, and uttered not one word that in the least reflected on the public or private character of Franklin.

Presently the tea-table was spread in the middle of the room, and my friend and I sat down with the family. It was indeed a great privilege for one just out of college to sit at table with the venerated man under whose colossal courage and inspiring eloquence the men of the Congress of 1776, who had not the gift of speaking in public, confidently sheltered themselves. He did not look younger than the record of his birth indicated, but he was hale and vigorous; and as I sat near him I could not but notice that he carried his full cup of tea to his lips as safely as any one around him, without spilling a drop from tremor. The table was spread with the neatness and simplicity that prevailed at that day in New England homes. Could a foreigner have looked in and seen the second President of the United States at his sufficient but simple and unostentatious meal, the central figure in the group of his own family, it must have been confessed that his manner of life presented a perfect pattern for a republican chief magistrate in retirement.

When we had arisen from the table and were preparing to depart, the honored statesman, standing upright in the family group, spoke to us a few words. He cursorily referred to the official letter of Franklin, then our minister in France, to Robert R. Livingston, at that time our secretary for foreign affairs, in which Franklin had sketched his character and complained of his conduct.*

He then added that for a long time after the letter was written he had known nothing about it, but when it came to his knowledge he printed in the "Boston Patriot" all that he had to say in reply; and he referred Mr. Norton to his articles in that paper respecting Franklin. With that reference he closed the conversation.

* The words of Franklin to which Adams referred are as follows: "If I were not convinced of the real inability of this court to furnish the further supplies we asked, I should suspect these discourses of a person in his station might have influenced the refusal; but I think they have gone no further than to occasion a suspicion that we have a considerable party of anti-Gallicans in America, who are not tories, and consequently to produce some doubts of the continuance of our friendship. As such doubts may hereafter have a bad effect, I think we cannot take too much care to remove them; and it is, therefore, I write this, to put you on your guard (believing it my duty, though I know that I hazard by it a mortal enmity), and to cau-

In the communications to the "Boston Patriot" on the career and character of Franklin, which were then referred to, the treatment of Franklin is unfair, and, from having been written too much from memory, is not altogether accurate. But its very bitter inculpations are tempered by concessions like these: "Mr. Jefferson has said that Dr. Franklin was an honor to human nature; and so indeed he was." And again: "Mr. Franklin, after all, and notwithstanding all his faults and errors, was a great and eminent benefactor to his country and mankind."

The impression left upon my mind by the interview was, that while Adams at the time of active antagonism might be ready to treat an adversary roughly, there remained on his mind no enduring malice; and when those who seemed to him to have wronged him had passed away from the world, he had no ignoble desire to wreak revenge on their memory, but impartially left their controversies to the jurisdiction of history.

This article was undertaken simply to preserve the record of an interview with ex-President Adams, where he showed a noble refusal to recall his strifes with the greatest of his rivals. But let us not leave him without a word on his administration of affairs, both foreign and domestic, during his four years' service, and on his relations with the man by whom he was superseded as President.

As to the initiation of the alien and sedition laws, John Adams writes:

"I recommended no such thing in my speech. Congress, however, adopted both these measures. I knew there was need enough of both, and therefore I consented to them." After they were passed he made no scruple about giving effect to them, especially the sedition law, believing that they were "constitutional and salutary, if not necessary."

The international result, which forms the glory of the administration of our foreign affairs while confided to John Adams, was the restoration of friendly relations between the United States and France. The first attempt at negotiation had been a failure; but revolutions had succeeded each other in Paris,

tion you respecting the insinuations of this gentleman against this court, and the instances he supposes of their ill-will to us, which I take to be as imaginary as I know his fancies to be, that Count de Vergennes and myself are continually plotting against him, and employing the news-writers of Europe to depreciate his character, etc. But, as Shakspeare says, 'trifles light as air,' etc. I am persuaded, however, that he means well for his country, is always an honest man, often a wise one, but sometimes, and in some things, absolutely out of his senses."—Benjamin Franklin to Robert R. Livingston, in the edition of Franklin's Works, by Jared Sparks, Vol. IX., pp. 534-5.

and Adams was encouraged by Washington to renew the attempt at an agreement. On this point of reconciliation with France, Washington spared no effort to support, encourage, and assist his successor. Receiving in a letter from Lafayette assurances that the Executive Directory of France were disposed to an accommodation of all differences between the United States and France, Washington, on Christmas day of 1798, answered :

"I would pledge myself, that the government and people of the United States will meet them heart and hand at a fair negotiation; having no wish more ardent than to live in peace with all the world, provided they are suffered to remain undisturbed in their just rights."

Being further confirmed in his expectations by a letter which he received from Joel Barlow to the like effect, and which, as he thought, could not have been written without the privacy of the French Directory, Washington, in a note to President Adams, not only favored bringing on a negotiation upon an open, fair, and honorable ground, but offered himself to be the intermediary channel of communication for restoring peace and tranquillity between the United States and France upon just, honorable, and dignified terms. He was sure that the renewal of negotiations with France was the ardent wish of all the friends of the rising American empire. Talleyrand, who, it will be remembered, knew the people of the United States from his own residence among them, gave, through the American minister at the Hague, the invitation to prepare the way for friendly intercourse, and Adams resolved at once to continue the negotiation for which Talleyrand had so urgently smoothed the way.

Oliver Ellsworth had been distinguished in public service for two and twenty years. In earlier life he was placed by Connecticut on its bench, but he was soon set apart for service connected with the United States; in 1777 he became a delegate to the Continental Congress. He served as a member of the convention which framed the Constitution of the United States; and there he more than any other shaped the policy which alone could have reconciled the great States and the small ones, and bound them both equally to the Union by reciprocal concessions. He too it was who, in the convention which framed our Constitution, joined with Sherman and successfully entreated that body to bar and bolt the doors of the United States against paper money, so that the prohibition was made perpetual and placed beyond the caprices of transient assemblies, by establishing it as one of the conditions of the Constitution itself. When the Constitution was referred to the several States, Ellsworth, in Connecticut,

explained its character to the convention of his State, and eminently assisted in securing full heartiness in its adoption. In the great work of carrying the Constitution into effect, the law for the organization of one of the three great departments of government is emphatically his work. He alone, or almost alone, framed the bill under which the department of the judiciary was organized; and it is worthy of remark, though I believe now for the first time noticed, that that law which Ellsworth had laboriously framed with the minutest attention to every detail gave no warrant for the jurisdiction of the Supreme Court of the United States to try any citizen for the offenses enumerated in the fatal Sedition act. Washington did not leave the chair of state till he had appointed Oliver Ellsworth the Chief Justice of the United States.

The first French mission which Adams had instituted arrived in Paris at a period in the revolution when the faction which for the time held control was willing to slight the overtures of the government of the United States; and, from a just self-respect, John Adams was unwilling to institute a second mission except after the most positive assurances that the mission would be heartily welcome. Adams, having received the amplest assurances from Talleyrand, the French minister of foreign affairs, through Murray, the American minister in Holland, that an American commission would be welcomed by France with the most perfect respect and cordial regard, and having the encouragement of Washington to proceed, wisely determined to renew the negotiation. Throwing aside his first thought of sending no one but the American minister through whom Talleyrand had sent his pressing invitation, he determined to constitute a mission of three. To impart to it the highest dignity, he named as its chief Oliver Ellsworth, who, as the head of the judiciary department, was a coördinate in dignity with John Adams himself. At the side of Ellsworth he placed William Richardson Davie, of North Carolina, a man of energy, a soldier in the war of our revolution, during which he had served with honor as a cavalry officer in the legion of Pulaski, an able member of the convention which framed our Federal Constitution, a favorite of his State, where he had just been elected governor. With them he joined Murray, through whom Talleyrand had invited the mission.

Oliver Ellsworth, though the delicate state of his health required careful attention, dared to sail through the specially rough storms of midwinter of 1799-1800 to Lisbon, and to encounter an almost equally severe voyage from Lisbon to a bay near Corunna. At Bergos, in

old Castile, they were met by a courier who brought from Talleyrand assurances that they would be received in Paris with an eagerness of cordiality. Arriving in Paris on the second of March, they were gladly welcomed by Talleyrand, and from their first arrival to the end of the mission nothing was wanting in the friendliness with which they were met and the respect and courtesy with which they were treated. No time was lost in entering upon the negotiations. Joseph Bonaparte, the eldest brother of the First Consul, was placed at the head of the French delegation. The labor on the American side was mainly done by Oliver Ellsworth; and after more than six months of labor, 1800, the treaty of peace, so fraught with present and prospective advantage to the United States, was signed.

It defined and asserted the rights of neutrals. It was agreed that the flag of the nation shall protect the merchandise of the ship, with the exception only of contraband of war, and that contraband was strictly limited. Another part of the treaty was of inestimable value to the United States; they in their hour of distress in the revolutionary war had bound themselves to protect France in all her possessions in the West Indies. This guarantee was generously renounced. Finally, the restoration of cordiality between France and the United States opened the way for the next Administration to negotiate for the acquisition of Louisiana. Shortly after the signing of the treaty, the American envoys prepared to leave Paris to embark for America.

The French government resolved to give them on their departure the clearest proof of the enduring good-will of France for the American republic. It chanced that Joseph Bonaparte, who was the richest of the family, possessed a magnificent country seat at Morfontaine, which lies some leagues from Paris on the road to Havre. There, on their way, at the chateau of Joseph Bonaparte, under whose lead the treaty with the United States had been concluded on the part of France, the American ministers were invited to be the guests at a farewell festival before their embarkation.

The American envoys arrived at the village of Morfontaine about two o'clock in the afternoon, and found there a large number of the French magistrates already assembled. At four o'clock Napoleon Bonaparte, the First Consul of France, who in November of the former year had overthrown the Council of Five Hundred and made himself the First Consul; in February, 1800, draping in mourning all standards and flags throughout the French republic, had announced to the French army in a general order that "the memory of Washington is dear to all freemen of the two worlds"; in

May had led an army with heavy artillery across the great St. Bernard; had entered Milan on the 2d of June, and after gaining on the 14th of that month a victory at Marengo, of which the fame rung through not Europe only but the world, had in the following July returned to Paris, and two days before this banquet had completed the treaty for the retrocession of Louisiana from Spain to France; and in less than thirty months more was to change the history of the world by transferring Louisiana, even to the Pacific Ocean, to the United States, — entered the chateau amidst salutes from artillery and bands of music. During the evening the castle and adjacent buildings were brilliantly illuminated. The approval of the treaty by the First Consul, of which assurance was formally given about eight in the evening, was followed by the firing of cannon. After this the guests, about 150 in number, were seated at tables in three large halls. To the largest of them the name was given of the "Hall of Union." It was superbly decorated with wreaths and numerous inscriptions commemorating the Fourth of July, 1776, and other days famous for important actions in America during their struggle for independence. The initial letters of France and America were inscribed in many places. The city of Philadelphia which was then the seat of the Federal Congress, and Havre de Grace which was the port for the embarkation of the American ministers, were represented with an angel on the wing from Havre de Grace to Philadelphia, bearing an olive branch. The second hall was called the "Hall of Washington," and was adorned with his bust and the French and American flags standing side by side. The third hall was called "The Hall of Franklin," whose bust was its ornament. All the decorations were specially designed to commemorate the independence of the United States and French liberty. In that spirit the First Consul, Napoleon, then just thirty-one years of age, gave as the first toast: "The memory of those who have fallen in the defense of French and American liberties." The second toast was proposed by the Third Consul, Lebrun: "The union of America with the powers of the North to enforce respect for the liberty of the seas." Last of all, Cambacérès, the Second Consul, in honor of the President of the United States, proposed "The successor of Washington." After supper there was a brilliant and ingenious display of fireworks in the garden. Next followed an exquisite concert of music; and about midnight the private theater was opened for the performance of two short comedies, in which the best of the actors and actresses from Paris played the parts. At the conclusion of one of the plays a song com-

plimentary to the United States was sung; and thus the evening came to an end.

To Chief Justice Ellsworth, the chief guest of the evening and the principal American negotiator of the treaty, his success brought highest honor; but the price at which he purchased it was his life. He fell a martyr in the service of his country and of peace. His sufferings in the long and terrible voyages which he had made in the winter across the ocean, and again from Portugal to the borders of France, and his prompt and continued assiduity in the negotiation of the treaty, wrecked his constitution. Unable at that season of the year to return to America, he was forced at once to send home the resignation of his post as Chief Justice of the United States. At a later day he was able to return to his country and to take some easy part in affairs; but for him, who more than any other had assisted to restore relations of friendship between France and the United States, and prepare the way for the cession of Louisiana to his country, the rest of life was but a slow and lingering passage through infirmities to the tomb.

At this cost peace and pleasant relations were restored between France and the United States. The establishment of good feeling in the foreign relations of this country, and especially with France, constitutes the crowning glory of the Administration of John Adams. Just before retiring from office, he wrote to a friend:

"After the 3d of March I am to be a private citizen. I shall leave the State with its coffers full, and the fair prospects of a peace with all the world smiling in its face, its commerce flourishing, its navy glorious, its agriculture uncommonly productive and lucrative. O my country! May peace be within thy walls, and prosperity within thy palaces."

The picture is not too favorably drawn. I have repeatedly heard Albert Gallatin, Jefferson's Secretary of the Treasury, assert that, before going out of office, John Adams had settled every difficult question, so that Jefferson as he entered upon office embarked upon the smoothest sea, with no winds but prosperous ones to fill his sails, with not a wave to disturb the public quiet. A similar train of thought beams through Jefferson's inaugural address, when he declares that he finds "this government, the world's best hope, the strongest government on earth, in the full tide of successful experiment."

War measures being at an end, the army reduced, the alien and sedition laws dead, domestic tranquillity and prosperity established, the first object of Jefferson in negotiating with France could be the cession of Louisiana to the United States.

The retirement of John Adams from the Federal city in the early morning of the 4th of March was not the act of a runaway; he never wanted courage, but he was obliged to vacate the President's mansion before the morning of the 4th of March, 1801; and the Federal city was then a new settlement in the woods, with scarcely five hundred inhabitants, with not one good hotel, and as there was no member of his cabinet in a house which could receive the departing President as a guest, he had nothing better to do than to start for his own home. Jefferson almost immediately sent him the homage of his high consideration and respect; and Adams, only twenty days after Jefferson had entered upon the office of President, wrote to him:

"This part of the Union is in a state of perfect tranquillity, and I see nothing to obscure your prospect of a quiet and prosperous administration, which I heartily wish you."

The life of John Adams was prolonged beyond the period which any other President has reached. In earlier life he and Jefferson had stood together in Congress, when the one spoke with overwhelming power for national independence and the other wrote the declaration of it with matchless felicity.

When Jefferson and Adams met in Europe, they were equally engaged in carrying on negotiations for their country; and the intimacy between them was such that each of them gave his portrait to the other. When, in an advanced age, they had both retired to private life, after years of rivalry and contest for the highest honor in the gift of the United States, Adams could not submit to any permanent estrangement between them, and they soon found themselves engaged in the most intimate private correspondence. The morning of the jubilee of our Declaration of Independence found both of them still alive; and as Adams on that day, at the age of ninety-one, became aware he was dying, his last words were: "Jefferson still lives." But Jefferson, the younger man, had gone a few hours before him.

Oliver Ellsworth.

"REBS ARE COMING!"

THE STRUGGLE FOR ATLANTA.*

ON the 18th of March, 1864, Grant and Sherman were together at Nashville. Grant, having received promotion, immediately set out for Washington, and Sherman accompanied him as far as Cincinnati. That meeting and journey are of interest. They involve the thorough discussion and planning of eventful campaigns. Men of different callings differ in their conception and execution of plans. Soldiers like Grant and Sherman consider first the forces at their disposal, and next a plan of operations. Grant had now under his general charge all the Union armies,—the Army of the Potomac, under Meade; that of the Ohio, near Knoxville, under Schofield; that of the Cumberland, under Thomas, near Chattanooga; that of the Tennessee, under McPherson, scattered from Huntsville, Alabama, to the Mississippi; that of the Gulf, under Banks, in Louisiana; besides subordinate detachments, under Steele and others, in Arkansas and farther west.

Grant took the whole field into his thought. He made three parts to the long, irregular line of armies, which extended from Virginia to Texas. He gave to Banks the main work beyond the Mississippi; to Sherman the middle part, covering the hosts of McPherson, Thomas, and Schofield; and reserved to himself the remainder. The numbers were known, at least on paper; the plan, promptly adopted, was simple and comprehensive: Break and keep broken the connecting links of the enemy's opposing armies; beat them one by one; unite for a final consummation. Sherman's part was plain. Grant's plan, flexible enough to embrace his own, afforded him "infinite satisfaction." It looked like "enlightened war." He rejoiced

at "this verging to a common center." "Like yourself," he writes to Grant, "you take the biggest load, and from me you shall have thorough and hearty coöperation."

As soon as Sherman returned to Nashville, he began organizing his three armies. He made his calculations so as to protect most faithfully one line of supply which runs through Louisville, Nashville, and Chattanooga, guarding it against enemies within and without his boundaries, and against accidents. He segregated the men of all arms for this protection. Block-houses and intrenchments were put at bridges and tunnels along the railway. Locomotives and freight cars were gathered in, and a most energetic force of skilled railroad men put at work or held in reserve under capable chiefs.

Now, when this vital work was in progress, through which sufficient supplies for 100,000 men were protected and through which large dépôts of surplus stores were accumulated, Sherman had, besides the large guards of his line, enough more men to count upon for an effective field force,—50,000 with Thomas, 35,000 with McPherson, 15,000 with Schofield, making a total of 100,000.

And, indeed, this fact gratified him; for had not sundry people, two years before, held him up as worthy of special distrust because he had declared that two hundred thousand men would be required to hold and push successfully this very line of operations? Finally his country, through Grant, had intrusted to him the means and the men that he required.

A few changes of organization were made. Slocum's corps, the Twelfth, and mine, the Eleventh, were consolidated, making a new Twenti-

* A paper on the Atlanta campaign, by General Joseph E. Johnston, will appear in the CENTURY magazine for August.—EDITOR.

eth, and Hooker was assigned to its command. I went at once to Loudon, East Tennessee, to take the Fourth Corps and relieve General Gordon Granger, to enable him to have a leave of absence. Slocum was sent to Vicksburg, Mississippi, to watch from that quarter the great river, while Hooker, Palmer, and myself, under Thomas, were to control the infantry and artillery of the Army of the Cumberland. In a few days I moved Wagner's, afterward Newton's, division and T. J. Wood's of my new corps to Cleveland, East Tennessee. Rations, clothing, transportation, and ammunition came pouring in with sufficient abundance, so that when orders arrived for the next movement, the 3d of May (1864), my division commanders, Stanley, Newton, and Wood, reported everything ready. This very day Schofield's column, coming from Knoxville, made its appearance at Cleveland. There was now the thrill of preparation, a new life everywhere. Soldiers and civilians alike caught the inspiration.

The Unionists, of whom there were many in East Tennessee, were glad, but the Confederates grew pale with apprehension.

TUNNEL HILL.

RINGGOLD and Catoosa Springs, Georgia, were the points of concentration for Thomas's three corps. We of his army were all in that neighborhood by the 4th of May. It took till the 7th for McPherson to get into Villanow, a few miles to the south of us. Schofield meanwhile worked steadily southward from Cleveland, East Tennessee, through Red Clay, toward Dalton, Georgia. The reader should know that Chattanooga, Cleveland, and Dalton were united by railway lines. These lines form an almost equilateral triangle. Dalton, its south-east vertex, was the center of the Confederate army, under Joseph E. Johnston. Pushing out from Dalton, toward us at Catoosa Springs, Johnston occupied the famous pass through

Taylor's Ridge, Buzzard's Roost Gap, and part of the ridge itself; and held, for his extreme outpost in our direction, Tunnel Hill, near which our skirmish line and his had first exchanged shots.

His northern lines ran athwart the base of the triangle, somewhere between Dalton and Red Clay.

Johnston had, according to his official return for April, a force of 52,992. At Resaca, a few days later, after the corps of Polk had joined him, it numbered 71,235. Our three field armies aggregated then, in officers and men, 98,797, with 254 pieces of artillery. The Confederate commander had about the same number of cannon. McPherson had thus far brought to Sherman but 24,465 men.

When the Army of the Cumberland was in line, facing the enemy, its left rested near Catoosa Springs, its center at Ringgold, the railway station, and its right at Leet's Tan-yard. My corps formed the left. Catoosa Springs was a Georgia watering-place, where were several large buildings, hotel and boarding-houses, amid undulating hills, backed by magnificent mountain scenery. Here, the morning of the 6th, I met Thomas and Sherman. Sherman had a habit of dropping in and explaining in a happy way just what he proposed. He at first intended that Thomas and Schofield should simply breast the enemy and skirmish with him on the west and north, while McPherson, coming from Alabama, was to strike the Atlanta railroad at least ten miles below Resaca. McPherson failing in getting back from furlough some of his troops, was not now deemed strong enough to operate alone; hence, instead, he was brought to Chattanooga and sent thence to Villanow, soon after to pass through the Snake Creek Gap of Taylor's Ridge, all the time being kept near enough the other armies to get help from them in a case of emergency. By this it was ardently hoped by Sherman that McPherson might yet succeed in getting upon Johnston's communications near Resaca. Thomas here urged his own views, which were to give Schofield and McPherson the skirmishing and demonstrations, while he (Thomas), with his stronger army, should pass through Snake Creek Gap and seize Johnston's communications. He felt sure of victory. Sherman, however, hesitated to put his main army twenty miles away beyond a mountain range on the enemy's line, lest he should thereby endanger his own. He could not yet afford an exchange of base. Still, in less than a week, as we shall see, he ran even a greater risk. But who shall criticise and condemn? In the game of war, as in other games, the risks usually increase with the excitements of the struggle.

BUZZARD'S ROOST GAP
(FROM A WAR-TIME SKETCH.)

GENERAL WILLIAM T. SHERMAN AT ATLANTA. (FROM A PHOTOGRAPH.)

Early in the day, May 7th, the Fourth Corps, arranged for battle, was near a small farm-house in sight of Tunnel Hill. Two divisions, Stanley's and Newton's, abreast in long, wavy lines, and the other, Wood's, in the rear, kept on the *qui vive* to prevent any surprises, particularly from the sweep of country to the north of us. The front and the left of the moving men were well protected by infantry skirmishers. It was a beautiful picture—that army corps, with arms glistening in the morning light, ascending the slope. By 8 o'clock the few rifle-shots had become a continuous rattle. First we saw far off, here and there, puffs of smoke, and then the gray horsemen giving back and passing the crest. Suddenly there was stronger resistance, artillery and musketry rapidly firing upon our advance. At 9 o'clock the ridge of Tunnel Hill bristled with Confederates, mounted and dismounted. A closer observation from Stanley's field-glass showed them to be only horse artillery and cavalry supports. In a few moments Stanley's

and Newton's men charged the hill at a run and cleared the ridge, and soon beheld the enemy's artillery and cavalry galloping away. "The ball is opened," Stanley called out, as I took my place by his side to study Taylor's Ridge and its "rocky face," which was now in plain sight. We beheld it, a craggy elevation of about five hundred feet, extending from a point not far north of us, but as far as the eye could reach southward. Its perpendicular face presented a formidable wall, and its Buzzard's Roost Gap, already made terrible by a former bloody trial of arms, afforded us no favorable door of entrance.

DALTON.

THOMAS's three corps, Palmer occupying the middle and Hooker the right, were now marched forward till my men received rifle-shots from the heights, Palmer's a shower of them from the defenders of the gap, and Hooker's a more worrisome fusillade from spurs of the ridge farther south. Thomas could not sit down behind this

formidable wall and do nothing. How could he retain before him the Confederate host? Only by getting into closer contact.

On the 8th, I sent Newton some two miles northward, where the ascent was not so abrupt. He succeeded by rushes in getting from cover to cover, though not without loss, till he had wrested at least one-third of the "knife edge" from those resolute men of gray. Quickly the observers of this sharp contest saw the bright signal flags up there in motion. Stanley and Wood gave Newton all possible support by their marksmen and by their efforts to land shells on the ridge. The enemy's signals were near to Newton. He tried hard, but failed, to capture them. In the night two pieces of artillery, after much toil, reached the top, and soon cleared away a few hundred yards more of this territory in bloody dispute. On the 9th of May, Thomas put forth a triple effort to get nearer his foe, notwithstanding some of us thought we were quite near already. First, Stanley's division reconnoitered that Buzzard's mouth into the very "jaws of death," till it drew the fire from newly discovered batteries, and set whole lines of Confederate masonry-supports ablaze. At this time I had a narrow escape. Stanley, Captain Kniffin of his staff, several other officers, and myself were in a group, watching a reconnaissance. All supposed there were no Confederate sharpshooters near enough to do harm, when *whiz* came a bullet which passed through the group; Kniffin's hat was pierced, three holes were made in my coat, and a neighboring tree was struck.

Thomas made a second effort. Palmer sent Morgan's brigade up one of the spurs south of the gap. It encountered the hottest fire, and suffered considerable loss in killed and wounded. One regiment, the 66th Illinois, drove back the enemy's first line, and, like Newton's men, came within speaking distance of their opponents. Here arose the story, to the effect that a witty corporal proposed to read to them the President's Emancipation Proclamation, and that they kept from firing while he did so. Still farther south, through Hooker with the Twentieth Corps, and almost beyond our hearing, Thomas made his third push. Fifty in this action were reported killed, and a larger number wounded, and among them every regimental commander engaged. Similarly, but with easier approaches than ours, Schofield kept Johnston's attention at the east and north. Such was the demonstration, while McPherson was making his long *détour* through Villanow, Snake Creek Gap, and out into Sugar Valley. He found the gap unoccupied; and so, with Kilpatrick's small cavalry detachment ahead, followed closely by Dodge's Sixteenth Corps with Logan's Fifteenth well

closed up, he emerged from the mountains on the morning of the 9th, at the eastern exit.

Immediately there was excitement — the cavalry advance stumbled upon Confederate cavalry, which had run out from Resaca to watch this doorway. Kilpatrick followed up the retreating Confederates with dash and persistency, till they found shelter behind the deep-cut works and guns at Resaca. In plain view of these works, though on difficult ground, Logan and Dodge pressed up their men, under orders from McPherson "to drive back the enemy and break the railroad." And pray, why were not these plain orders carried out? McPherson answers in a letter that night sent to Sherman: "They [probably Polk's men] displayed considerable force and opened on us with artillery. After skirmishing [among the gulches and thickets] till nearly dark, and finding that I could not succeed in cutting the railroad before dark, or in getting to it, I decided to withdraw the command, and take up a position for the night between Sugar Valley and the entrance to the gap." At the first news, Sherman was much vexed, and declared concerning McPherson's failure to break the enemy's main artery: "Such an opportunity does not occur twice in a single life, . . . still he was perfectly justified by his orders."

Our commander, believing that Johnston would now speedily fall back to Resaca, at once changed his purpose. Leaving me at Rocky Face with the Fourth Corps and Stoneman's small division of cavalry to hold our line of supply, Sherman pressed after McPherson the armies of Thomas and Schofield. But Johnston was not in a hurry. He terrified me for two days by his tentative movements, till our skirmishing amounted at times almost to a battle. But the night of the 12th of May, he made off in one of his clean retreats. At dawn of the 13th, the formidable Buzzard's Roost Gap was open and safe, and our men passed through. Stoneman rushed into the village of Dalton from the north, and the Fourth Corps, eager and rapid, kept close to the chasing cavalry. Not far south of Dalton we came upon a bothersome Confederate rear guard, which made our marching all that long day slow and spasmodic, yet before dark of the same, my command had skirted the eastern slope of Taylor's Ridge for eighteen miles, and joined skirmishers with Sherman, who was already with McPherson abreast of Resaca. Thus we ended the combats of Tunnel Hill and Dalton, and opened up Resaca.

RESACA.

As soon as Johnston reached the little town of Resaca, he formed a horse-shoe-shaped line, something like ours had been at Gettysburg. He

rested Polk's corps on the Oostenaula River; placed Hardee's next, running up Milk Creek; and then curved Hood's back to strike the Conasauga River. After the Confederates had thrown up the usual intrenchments, and put out one or two small advanced forts with cannon, the position was as strong as Marye's Heights had been against direct attack. We spent a part of the 14th of May creeping up among the bushes, the rocks, and the ravines.

Early that morning, while this was going on, Sherman, who had worked all night, was sitting on a log, with his back against a tree, fast asleep. Some men marching by saw him, and one fellow ended a slurring remark by: "A pretty way we are commanded!" Sherman, awakened by the noise, heard the last words. "Stop, my man," he cried; "while you were sleeping last night, I was planning for you, sir; and now I was taking a nap." Thus, familiarly and kindly, the general gave reprimands and won confidence.

McPherson rested his right upon the Oostenaula River, opposite Polk. My impression is that Palmer and Hooker came next; and then that brave young officer, Cox, commanding the Twenty-third Corps, against a storm of bullets and shells, swung his divisions round to follow the bend in the enemy's line. I watched the operation, so as to close upon his left. T. J. Wood's division moved up in a long line, with skirmishers well out, and then Stanley's carried us to the railway. Stanley's chief of artillery arranged two or three batteries to keep the enemy from walking round our unprotected left. The air was full of screeching shells and whizzing bullets, coming uncomfortably near while line after line was adjusting itself for the deadly conflict. Our fighting at Resaca did not effect much. There might possibly have been as much accomplished if we had used skirmish lines alone. In McPherson's front, Logan had a battery well placed, and fired till he had silenced the troublesome foes on a ridge in his front; then his brave men, at a run, passed the ravine and secured the ridge. Here Logan intrenched his corps; and Dodge, abreast of him, did the same. Afterward, McPherson seized another piece of ground across Camp Creek, and held it. The evening of the 14th, a vigorous effort was made by Polk to regain this outpost, but he was repulsed with loss.

The detailed account gives great credit to Charles R. Woods, Giles A. Smith, and J. A. J. Lightburn. 100 prisoners and 1300 Confederates *hors de combat* are on Logan's list. This work forced Johnston to lay a new bridge over the Oostenaula. The divisions of Absalom Baird, R. W. Johnson, Jeff. C. Davis, and John Newton plunged into the thickets and worked

their way steadily and bravely into the reentrant angles on Hardee's front. On Schofield's field, one of his divisions, Judah's, had a fearful struggle, losing six hundred men; the others, coming to its help, captured and secured a part of the enemy's intrenchments. Hood assailed my left after 3 p. m. The front attack was repulsed, but heavy columns came surging around Stanley's left. Everybody, battery men and supporting infantry, did wonders; still, but for help promptly rendered, Sherman's whole line, like the left of Wellington at Waterloo, would soon have been rolled up and displaced. But Colonel Morgan of my staff, who had been sent in time, brought up Williams's division from Hooker's corps as quickly as men could march. Stanley's brave artillerymen were thus succored before being forced to yield their ground, and Hood, disappointed, returned to his trenches. The next day, the 15th, came Hooker's attack. He advanced in a column of deployed brigades. Both armies watched with eager excitement this passage-at-arms—the divisions of Butterfield, Williams, and Geary were here. They seized some trenches and cheered, but were stopped before a sort of lunette holding four cannon. The Confederates were driven from their trenches; but our men, meeting continuous and deadly volleys, could not get the guns till night. A color-bearer, Hess, of Colonel Harrison's brigade, while his comrades were retiring a few steps for better cover of the ground, being chagrined at the defiant yell behind him, unfurled his flag and swung it to the breeze. He was instantly killed. A witness says: "There were other hands to grasp the flag, and it came back, only to return and wave from the very spot where its former bearer fell." A Southern writer, who watched this contest, says:

"On came the enemy, cheering loudly, and confident that their superior numbers would insure them success. They approached to within fifty yards of the line, firing rapidly on our men; a sheet of fire, a deafening roar, which sounded like the eruption of a volcano, was the answer; and the dead and wounded lay piled up before our works."

While the main battle was in progress, Dodge had sent a division under the one-armed Sweeny to Lay's Ferry, a point below Resaca. Under the chief engineer, Captain Reese, he laid a bridge and protected it by a small force. Sweeny, being threatened by some Confederates crossing the river above him, feared that he might be cut off from the army, so that he suddenly drew back about a mile beyond danger. On the 15th, however, he made another attempt and was more successful; formed a bridge-head beyond the river, threw over his whole force, and fought a successful battle against Martin's Confederate cavalry, before

THE BATTLE OF RESACA, GEORGIA. (FROM "THE MOUNTAIN CAMPAIGNS IN GEORGIA, ETC." PUBLISHED BY THE WESTERN & ATLANTIC R. R. CO.)

H. P. Maud

Walker's infantry, which was hastily sent against him from Calhoun, could arrive. Besides Sweeney's division, Sherman dispatched a cavalry force over the pontoons, instructing them to make a wider detour. The operations in this quarter being successful, there was nothing left to the Confederate commander but to withdraw his whole army from Resaca. This was effected during the night of the 15th, while our weary men were sound asleep. At the first peep of dawn, Newton's skirmishers sprang over the enemy's intrenchments to find them abandoned.

ADAIRSVILLE.

In the ensuing pursuit, Thomas, crossing the river on a floating bridge, hastily constructed, followed directly with the Fourth and the Fourteenth corps.

Stanley had some sharp fighting with Stewart's Confederate division, which was acting as Johnston's rear guard. It was, in fact, a running skirmish, that lasted till evening, at the close of which we encamped for the night near the enemy's empty works at Calhoun. Meanwhile, McPherson had been marching on parallel roads to the right toward Rome, Georgia, Jeff. C. Davis's division from Thomas's army sweeping farther still to the right, and Schofield, accompanied by Hooker, to the left toward Cassville.

Our enemy between these columns, with his entire force, made a brief stand on the 17th of May at Adairsville, and fortified. About 4 P. M. Newton and Wood, of my corps, Wood on the right, found the resistance constantly increasing as they advanced, till Newton's skirmishers, going at double-time through clumps of trees, awakened a heavy opposing fire. A little after this, while I was watching the developments from a high point, Sherman with his staff and escort joined me. Our showy group immediately drew upon it the fire of a battery, shells bursting over our heads with indescribable rapidity. Colonel Morgan's horse was very badly lamed; Fullerton, the adjutant-general, was set afoot, and several horses of the escort killed or crippled. Captain Bliss, of Newton's staff, had one shoulder-strap knocked off by a fragment, badly bruising him. The skirmishing of Newton and Wood kept increasing. In fact, both parties, though desiring to avoid a general battle, nevertheless reenforced, till the firing amounted for a time to a real engagement. It had not been discontinued at sunset, and it was not till after 9 o'clock that the rattling of the musketry had diminished to the ordinary skirmish, and the

batteries had ceased, except an occasional shot, as if each was trying to have the last gun. The losses in my command in this combat were about two hundred killed and wounded. The morning of the 18th found the works in front of Adairsville with few reminders that an army had been there the night before. Hooker and Schofield had done the business. Johnston's scouts during the night brought him word that a large Federal force was already far beyond his right near Cassville, threatening his main crossing of the river; and also that McPherson was camping below him at McGuire's Cross-roads, and that our infantry (Davis's division) was already in sight of the little town of Rome, where, under a weak guard, were foundries and important mills. We began now to perceive slight evidences of our opponent's demoralization. I captured a regiment and quite a large number of detached prisoners. The whole number taken, including many commissioned officers, was about four thousand.

The rapidity of the repairs of the badly broken railroad seemed miraculous. We had hardly left Dalton before trains with ammunition and other supplies arrived. While our skirmishing was going on at Calhoun, the locomotive whistle resounded in Resaca. The telegraphers were nearly as rapid. The lines were in order to Adairsville the morning of the 18th. While we were breaking up the State arsenal at Adairsville, caring for the wounded, and bringing in Confederate prisoners, word was telegraphed from Resaca that bacon, hard-bread, and coffee were already there at our service.

Johnston, by his speedy night work, passed on through Kingston, and formed an admirable line of battle in the vicinity of Cassville, with his back to the Etowah River, protecting the selected crossing.

This was his final halt north of that river, so difficult with its mountain banks. Johnston remained here to obstruct and dispute our way one day only, for Schofield and Hooker had penetrated the forests eastward of him so far that Hood, still on Johnston's right, insisted that the Yankees were already beyond him in force.

Upon this report, about which there has since been much controversy, Johnston ordered a prompt withdrawal. The morning of the 21st of May, bright and clear, showed us a country picturesque in its natural features, with farm and woodland as quiet and peaceful as if there had been no war. So Sherman, taking up his headquarters at Kingston, a little hamlet on the railway, gave to his armies three days' rest.*

* It was Sunday morning when my friend E. P. Smith, of the Christian Commission, afterward Commissioner of Indian Affairs, was ringing the church bell at Kings-

ton. The rope unexpectedly caught his trousers near his shoe and rent them sadly from bottom to top. Sherman, being just then disturbed by the ringing, sent a

MAJOR-GENERAL JOHN A. LOGAN. (FROM A PHOTOGRAPH.)

A glance at the map [page 446] shows the Etowah flowing nearly west thirty miles from Allatoona to Rome. Sherman's headquarters at Kingston were midway. While the armies were resting, the right (Davis's division) at Rome, the left (Schofield and Hooker) near Cartersville, and the remainder at Kingston, the railroad and telegraph lines were repaired to Kingston; baggage, temporarily

guard to arrest the supposed "bummer." So my friend, in spite of indignant protest, was marched to Sherman's ante-room and kept under guard for an hour. Then, in that plight, being admitted to his presence, Sherman looked up from his writing and asked abruptly:

abandoned, came back to officers and men; necessary supplies, at the hands of smiling quartermasters and commissaries, now found us. The dead were buried, the sick and wounded made more comfortable, and everybody got his mail and wrote letters home. Meanwhile Sherman and his army commanders were endeavoring to find the location of their enemy.

Johnston was holding the pass of Allatoona

"What were you ringing that bell for?"

"For service. It is Sunday, General," Smith replied.

"Oh! is it?" answered Sherman. "Didn't know it was Sunday. Let him go."

strongly, and probably rested his right at that natural fortress, and extended his army along the ridge of Allatoona Creek toward the south west, possibly to Lost Mountain, where that stream rises. He was picketing a parallel ridge in front of his line, along another creek, the Pumpkin Vine. This is substantially where we found this able and careful enemy; only he pushed a little to the left and forward as we came on, till Hardee was at Dallas, and Hood at New Hope Church. Our march was resumed the morning of the 24th of May, Thomas crossing his own pontoons south of Kingston; Hooker, though contrary to the plan, went in advance of Schofield's column over a bridge at Milam's, east of Kingston; Davis being at Rome, went straight forward from that place; and McPherson did the same from his position, laying his bridges so as to take the road to Van Wert. Stoneman's division of cavalry, fording the river above Schofield, covered the left. Garrard's division was near McPherson and Davis, while McCook's cleared the front for the center. The whole country between the Etowah and the Chattahoochee over which we marched appeared desolate enough. Sometimes there were old pine forests, half cleared, with tall burnt and blackened stumps; very few openings and very few farms, and those few small and poor; other parts covered with trees having dense underbrush, which the skirmishers had great difficulty in penetrating. The instant one left the ordinary "hog-backs" he plunged into deep ravines or ascended abrupt steeps. There was much loose, shifting soil on the hills, also many lagoons and small streams bordered with treacherous quicksands.

NEW HOPE CHURCH.

VERY SOON on the first day, the usual skirmishing with the cavalry began, but there was not much delay. Hooker, coming into Thomas's road the next morning, the 25th, led

CONFEDERATES DRAGGING GUNS UP KENESAW MOUNTAIN.
(FROM THE "VALENTINE," PUBLISHED BY THE WESTERN & ATLANTIC R. R. CO.)

our column, taking the direct road toward Dallas. It was showery all day, and one can imagine the disheartening effect of this unfavorable weather on men and animals as they toiled over roads growing constantly worse. To relieve the situation as much as possible and keep well closed up, Thomas had my corps take advantage of country roads to the right, that would bring us into Dallas by the Van Wert route. McPherson and Davis had already come together at Van Wert. Now, suddenly, Geary's division found a bridge over Pumpkin Vine Creek on fire, and hostile cavalry behind it. The cavalry soon fled, and the bridge was repaired. Hooker, thinking there was more force in that quarter, pushed up the road toward New Hope Church. He had gone but a short distance before he ran upon one of Hood's brigades. It was an outpost of

Stewart's division, put there to create delay. Hooker soon dislodged this outpost and moved on, driving back the brigade through the woods, till he had come upon the enemy's main line.

The sound of cannon speedily drew Sherman to the point of danger. He immediately ordered the necessary changes. Williams's division, having passed on, faced about and came back. Butterfield's hastened up. These, each forming in parallel lines, promptly assaulted Hood's position. Again and again Hooker's brave men went forward through the forest only to run upon log barricades, which were so thoroughly manned by the enemy, and so protected by well-posted artillery, that to take them under a galling fire was impossible. Of course, this meant for Hooker a succession of bloody repulses. The heaviest shower of the day, accompanied with lightning and thunder, was going on during these awful charges. I received word, turned to the left by the first opportune road, and deployed Newton's division to the right of Hooker by 6 P. M. The remainder of my command came up over roads deep with mud and obstructed by wagons. In the morning all the troops were on hand. Any attempt to sketch the ghastly pictures of that terrible night would fail. The nearest house to the field was filled with the wounded. Torch-lights and candles lighted up dimly the incoming stretchers and the surgeons' tables and instruments. While the doctors could stand on their feet or move their arms, their arduous work was unceasing. The very woods seemed to moan and groan with the voices of sufferers not yet brought in.

McPherson, with Davis for his left, took position at Dallas, having Logan on his right, and Garrard's cavalry still beyond. There must have been a gap of three miles between McPherson and us. Schofield was badly injured by the fall of his horse in that black forest while finding his way during the night to Sherman's bivouac, so that for a few days Cox took his command. Cox, with his Twenty-third Corps, and Palmer with his (the Fourteenth), swung in beyond me, as my men were moving up carefully into their usual positions in line of battle. Now the enemy kept strengthening his trench-barricades, which were so covered by thickets that at first we could scarcely detect them. As he did, so did we. No regiment was long in front of Johnston's army without having practically as good a breastwork as an engineer could plan. There was a ditch before the embankment and a strong log revetment behind it, and a heavy "top-log" to shelter the heads of the men. I have known a regiment, in less than an hour after it reached its position, with axes and shovels to shelter itself completely against musketry and artillery.

PICKETT'S MILL.

It would only weary the reader's patience to follow up the struggle step by step from New Hope Church to the Chattahoochee. Still, these were the hardest times which the soldiers ever experienced. It rained continuously for seventeen days; the roads, becoming as broad as the fields, were a series of quagmires. And, indeed, it was difficult to bring enough supplies forward from Kingston to meet the needs of the army. Sherman began to pass his armies to the left. First, I was sent with two divisions to attempt to strike Johnston's right. I marched thither Wood's division, supported by R. W. Johnson's, and connected with the army by Cox on my right. At Pickett's Mill, believing I had reached the extreme of the Confederate line, at 6 P. M. of the 27th I ordered the assault. Wood encountered just such a position as had Hooker at New Hope Church, and was similarly repulsed, suffering much loss. R. W. Johnson's division was hindered by a side-thrust from the hostile cavalry, so that we did not get the full benefit of his forward push. We believed that we should otherwise have lodged at least a brigade beyond Hindman's Confederate division. But we did, however, what was most important: we worked our men all that weary night in fortifying. The Confederate commander was ready at daylight to take the offensive against us at Pickett's Mill, but did not, because he found our position and works too strong to warrant the attempt. With a foot bruised by the fragment of a shell, I sat that night among the wounded in the midst of a forest glade, while Major Howard of my staff led regiments and brigades into the new position chosen for them. General R. W. Johnson had been wounded, Captain Stinson of my staff had been shot through the lungs, and a large number lay there, on a sideling slope by a faint camp-fire, with broken limbs or disfigured faces. It was a mute protest against the business of war.

DALLAS.

THE next day, the 28th, McPherson made an effort to withdraw from Dallas, so as to pass beyond my left; but as Hardee at the first move quickly assailed him with great fury, he prudently advised further delay. This battle was the reverse of mine at Pickett's Mill. The enemy attacked mainly in columns of deployed regiments along the front of Dodge's and Logan's corps, and was repulsed with a dreadful loss, which Logan estimated at two thousand. Now, necessity pressing him in every direction, Sherman, mixing divisions somewhat along the line, gradually bore his armies to

MAJOR-GENERAL JAMES B. MCPHERSON, KILLED JULY 22D, 1864. (FROM A PHOTOGRAPH.)

the left. The 1st of June put Stoneman into Allatoona, and on the 3d, Schofield's infantry was across the railroad near Ackworth, having had a severe and successful combat en route.

PINE TOP.

BEING now far beyond Johnston's right, and having seized and secured the Allatoona Creek from its mouth to Ackworth. Sherman was ready, from Allatoona as a new base, to push forward and strike a new and heavy blow, when, to his chagrin, in the night of the

4th of June, Johnston abandoned his works and fell back to a new line. This line ran from Brush Mountain to Lost Mountain, with "Pine Top" standing out in a salient near the middle. He also held an out-post in front of Gilgal Church abreast of Pine Top. Slowly, amid skirmishes and small combats, for the most part in dense woods, we continuously advanced. On my front we seized the skirmish-holes of the enemy, made epaulements for batteries there, and little by little extended our deep ditches or log-barricades close up to and abreast of Johnston's. As we settled down

to steady work again, McPherson was near Brush Mountain, having pushed down the railroad. F. P. Blair's corps (the Seventeenth) from Huntsville, Alabama, had now joined him, making up for our losses, which were already, from all causes, upward of nine thousand. This accession gave heart to us all. Thomas was next, advancing and bearing away toward Pine Top, and Schofield coming up against the salient angle near Gilgal Church. To tell the work of these two opposing hosts in their new position is a similar story to the last. There was gallant fighting here and there all along the lines. Here it was that my batteries, opening fire under the direct instruction of Sherman, drove back the enemy from the exposed intrenchments on Pine Top. It was at this time that General Polk was killed. McPherson, by overlapping Hood, skirmished heavily, and captured the 40th Alabama regiment entire. Schofield, brushing away the cavalry, penetrated between Lost Mountain and Gilgal Church, put his artillery on a prominent knoll, and, with rapid discharges, took Hardee in reverse.

MUD CREEK.

THAT night, the 16th of June, Johnston again went back to a new line, already prepared, just behind Mud Creek. Our troops, being on the alert, followed at once with great rapidity. Just where the old lines joined the new (for Johnston's right wing was unchanged), I saw a feat the like of which never elsewhere fell under my observation. Baird's division, in a comparatively open field, put forth a heavy skirmish-line, which continued such a rapid fire of rifles as to keep down a corresponding hostile line behind its well-constructed trenches, while the picks and shovels behind the skirmishers fairly flew, till a good set of works was made four hundred yards off and parallel to the enemy's. One of my brigades (Harker's), by a rush, did also a brave and unusual thing: it captured an intrenched and well-defended line of the enemy's works and took their defenders captive. Again, another (Kirby's brigade), having lost Bald Hill in a skirmish, retook it by a gallant charge in line, under a hot fire of artillery and infantry, and intrenched and kept it.

CULP'S FARM.

HOOD, who had been massed opposite McPherson, made a forced night-march, and suddenly appeared on the other flank fronting Schofield and Hooker. With his known method of charging and firing, he delivered there a desperate attack on the 22d of June.

He was, after a hard battle, repulsed with heavy loss. This was the "Battle of Culp's Farm." Here it was that Hooker received a reproof from Sherman for an exaggerated report, which inferentially, but wrongly, blamed Schofield. Hooker was ever after incensed at Sherman.

KENESAW.

AGAIN, by the gradual pressure against Johnston's right and left, Sherman forced him to a new contraction of his lines. This time it was the famous Kenesaw position which he assumed. With his right still at Brush Mountain, he extended a light force over the crest of the Kenesaws, and placed a heavier one along the southern slope, reaching far beyond the Dallas and Marietta road. He drew back his left and fortified. The whole line was stronger in artificial contrivances and natural features than the cemetery at Gettysburg. The complete works, the slashings in front, and the difficulties of the slope toward us under a full sweep of infantry and of artillery cross-fire made the position in itself next to impregnable.

For reasons similar to those which influenced Lee to strike twice for Little Round Top, Sherman ordered an assault here with the hope of carrying the south slope of Kenesaw, or of penetrating at some weak point of Johnston's long front. Schofield, well southward, advanced and crossed Olley's Creek, and kept up enough fire and effort to hold a large force in his front. McPherson, on the left, did the same, quite a serious engagement being sustained by Logan's corps straight against the unascendable mountain. Logan's losses from the trenches in his front, and from artillery that raked his men as they advanced, were very heavy. Seven regimental commanders fell from death or wounds. But the dreadful battle, hard to describe, was left to Thomas. He commanded two attacks, one opposite Confederate Loring's left, the other in front of Cheatham. Newton's division led my attack, and Davis that of Palmer. Like Pickett's charge at Gettysburg, the movement was preceded by a heavy cannonade. Then our skirmishers sprang forward and opened; and quickly the enemy's skirmish-line was drawn back to their main work.

Harker, commanding one brigade, led his column rapidly over the open ground. Wagner did the same on Harker's left, and Kimball put his brigade in close support. The enemy's fire was terrific, the missiles passing and crossing and filling the valley. Our men did not stop, unless struck, till they had gained the edge of the felled trees; a few penetrat-

ed, to fall close to the enemy's parapet; but most sought shelter behind logs and rocks, in rifle holes, or depressions of the ground.

Harker, moving with them, cheered on his men; when they were forced to stop, he rallied them again and made a second vigorous effort, in which he fell mortally wounded. Davis's effort was like Newton's; he met the same withering fire from rifle-balls and shells. But his men managed to make a shelter, which they kept, close up to the hostile works. Here they stayed and intrenched. Among those who fell were brigade commanders Colonel Daniel McCook and Colonel Harmon. Our losses in this assault were heavy indeed, and our gain was nothing. We realized now, as never before, the futility of direct assaults upon intrenched lines which were already well prepared and well manned.

SMYRNA CAMP GROUND.

PLAINLY there was now nothing left for Sherman to do but to send his left army (McPherson's) to follow up the right (Schofield's), across Olley's Creek, and force his cavalry to Sandtown and the Chattahoochee far below Johnston's force. The first sign, namely,

McPherson's starting, and Schofield's boldness, set the Confederates again in motion. The morning of the 3d of June, Sherman turned his spy-glass to the Kenesaw crest, and saw our pickets "crawling up the hill cautiously." The strong works, from which so many blows distressful to us had been dealt, were found vacant.

Johnston had made new breastworks six miles below, at Smyrna Camp Ground, and another complete set, by the labor of slaves and new levies, where the railway crosses the Chattahoochee. Thomas, taking up the pursuit, followed his enemy through Marietta and beyond. My command skirmished up to the Smyrna works during the 3d. The next day Sherman paid us a Fourth of July visit. He

SCENE OF GENERAL MCPHERSON'S DEATH, ON THE EAST SIDE OF ATLANTA. (FROM PHOTOGRAPHS.)

A 32-pounder cannon set in a granite block for a base now marks the spot of General McPherson's death. A large pine stands within a few feet of the monument which faces a partly improved roadway that is called McPherson Avenue.

THE BATTLE OF ATLANTA, JULY 22D.

Fuller's division (of the Sixteenth Corps) rallying to hold their ground after being forced back by the first charge of the Confederates in their flank attack. (From the painting by James E. Taylor.)

could not at first believe that Johnston would make another stand north of the river. "Howard," he said to me, "you are mistaken; there is no force in your front; they are laughing at you!" We were in a thinnish grove of tall trees, in front of a farm-house. "Well, General," I replied, "let us see." I called Stanley, whose division held the front. "General, double your skirmishers and press them." At once it was done. The lines sped forward, capturing the outlying pits of the enemy, and took many prisoners; but a sheet of lead instantly came from the hidden works in the edge of the wood beyond us, and several unseen batteries hurled their shot across our lines, some of them reaching our grove and forcing us to retire. Sherman, as he rode away, said that I had been correct in my report. While we kept the Confederates busy by skirmishing and battery firing, a set of demonstrations to the north and south of us finally resulted in gaining crossings of the river at Roswell, Soap Creek, Powers's and Paice's ferries.

The first effected was by Schofield pushing out from Soap Creek boats loaded with men, crossing quickly, and surprising the Confederate cavalry and cannon in his front. This was

done on the 9th of July. As soon as Johnston knew of it, he left those grand works near the river, burned his bridges, and hastened his retreat to Atlanta. The weather had become good, and there was great animation and manifest joy on our side. It was gratifying to escape from such fastnesses and dismal forests as those which had hampered us for over a month, and we now firmly believed that the end of the campaign was sure.

Our armies made a right wheel — Thomas, on the pivot, taking the shortest line to Atlanta; McPherson, on the outer flank, coming by Roswell to Decatur, with Schofield between.

PEACH TREE CREEK.

As the several columns were crossing the famous Peach Tree Creek my corps was divided. I was sent, with Stanley and Wood, to connect with Schofield, causing a gap of two miles. Newton remained Thomas's left; on Newton's right was Ward; next, Geary; then, Williams; last, Palmer's corps; all, having crossed over, were stretched out along the creek. There was at that point but little open

ground, mostly woodland, and very uneven with cross-ravines.

Just at this time, much to our comfort and to his surprise, Johnston was removed, and Hood placed in command of the Confederate army. Johnston had planned to attack Sherman at Peach Tree Creek, expecting just such a division between our wings as we made.

Hood endeavored to carry out the plan. A. P. Stewart had Polk's corps, and Cheatham took Hood's. Hardee on the right and Stewart on his left, in lines that overlapped Newton's position, at 3 o'clock of the 20th of July, struck the blow. They came surging on through the woods, down the gentle slope, with noise and fury like Stonewall Jackson's men at Chancellorsville. As to our men, some of them were protected by piles of rails, but the most had not had time to barricade.

Stewart's masses advanced successively from his right, so Newton was first assailed. His rifle and cannon, firing with utmost steadiness and incessantly, soon stopped and repulsed the front attack; but whole battalions went far east of him into the gap before described.

Thomas, behind the creek, was watching; he turned some reserved batteries upon those Confederate battalions, and fired his shells into the thickets that bordered the deep creek, sweeping the creek's valley as far as the cannon could reach. This was sufficient: in his own words, "it relieved the hitch." The hostile flankers broke back in confusion. In

succession, Ward, Geary, Williams, and Palmer received the on-coming waves, and though their ranks were shaken in places, they each made a strong resistance, and soon rolled the Confederates back, shattered and broken. Hardee would have resumed the assault, but an order from Hood took away a whole division (Cleburne's), for McPherson was too rapidly approaching Cheatham and the defenses of Atlanta from the east.

The battle of the 20th did not end till Gresham's division, on McPherson's left, had gone diagonally toward Atlanta, sweeping the hostile cavalry of Wheeler before it past the Augusta railroad, and skirmishing up against an open knob denominated Bald Hill.

Gresham, himself a fine officer, during his brisk

movement was severely wounded. Wheeler had here made a desperate and successful stand; and soon after, in the evening, that division (Cleburne's) which was taken from Newton's sorely handled front was brought hither and put into the trenches, in order to make secure the right of Hood's line. The Bald Hill was an important outpost.

THE BATTLE OF ATLANTA.

THE 21st, a fearfully hot day, was spent by all in readjustment. Thomas brought his three corps forward, near to the enemy. The gap in my lines closed as we neared the city. Schofield filled the space between the Fourth (mine) and Logan's corps. McPherson, to get a better left, ordered Blair to seize Bald Hill. General Force, of Leggett's division, supported by Giles A. Smith, who now had Gresham's place, charged the hill and carried it, though with a heavy loss. No time ran to waste till this point was manned with batteries protected by thick parapets and well secured by infantry supports.

Atlanta appeared to us like a well-fortified citadel with outer and inner works. After Thomas had beaten him, Hood resolved to give up the Peach Tree line; so, after dark, he drew back two corps into those outer works.

Hardee, however, was destined to a special duty. About midnight he gathered his four divisions into Atlanta: Bate led the way; Walk-

er came next; Cleburne, having now left the vicinity of Bald Hill (for he was soon to go beyond it), followed; then came Maney in rear. They pushed out far south and around Grisham's sleeping soldiers; they kept on eastward till Hardee's advance was within two miles of Decatur, and his rear was nearly past Sherman's extreme left. There, turning north, he formed his battle front; then he halted on rough ground, mostly covered by forest and thicket. He had made a blind night-march of fifteen miles, so he rested his men for a sufficient time, when, slowly and confidently, the well-disciplined Confederates in line took up their forward movement. Success was never more assured, for was not Sherman's cavalry well out of the way, breaking a railroad and burning bridges at and beyond Decatur? And thus far no Yankee except a chance prisoner had discovered this Jacksonian march. The morning showed us empty trenches from Bald Hill to the right of Thomas. We

on the 21st, toward Atlanta. Dodge remained for the night with head of column a mile or more in rear of Blair's general line. Fuller's division was nearest Blair's left, and Sweeny's not far from the Augusta railroad, farther to the north. McPherson spent the night with Sweeny. His hospitals and main supply trains were between Sweeny and the front. About midday McPherson, having determined to make a stronger left, had set Dodge's men in motion. They

marched, as usual, by fours, and were in long column pursuing their way nearly parallel to Hardee's battle front, which was hidden by the thick trees. Now danger threatened: at the first skirmish shots Dodge's troops halted and faced

quickly closed again on Atlanta, skirmishing as we went. McPherson's left was, however, near enough already, a single valley only lying between Blair's position and the outer defensive works of the city. The Sixteenth Corps (Dodge), having sent a detachment under General Sprague to hold Decatur, to support the cavalry and take care of sundry army wagons, a thing successfully accomplished, had marched,

to the left and were in good line of battle. The Confederate divisions were advancing: fortunately for Dodge, after the firing began Hardee's lines nearing him had to cross some open fields. McPherson was then paying a brief visit to Sherman near the Howard house. The attack was sudden, but Dodge's veterans, not much disturbed, went bravely to their work. It is easy to imagine the loud roar of artillery

BATTLE OF ATLANTA, JULY 22D — RECAPTURE FROM THE CONFEDERATES OF DE GRESS'S BATTERY. I.

The view is west toward Atlanta: the Confederates in capturing the battery charged along the Georgia Railroad from the rolling-mill (see map, page 457), and took advantage of the cover of the railroad embankment and cut.

and the angry sounds of musketry that came to Sherman and McPherson when the sudden assault culminated and extended from Dodge to Blair's left. McPherson mounted, and galloped off toward the firing. He first met Logan and Blair near the railway; then the three separated, each to hasten to his place on the battle-line. McPherson went at once to Dodge; saw matters going well there; sent off aides and orderlies with dispatches, till he had but one or two men left with him. He then rode forward to pass to Blair's left through the thick forest interval. Cheatham's division was just approaching. The call was made, "Surrender!" But McPherson, probably without a thought save to escape from such a trap, turned his horse toward his command. He was instantly slain, and fell from his horse. One of his orderlies was wounded and captured; the other escaped to tell the sad news. Our reinforcements were on the way, so that Cheatham was beaten back. While the battle raged, McPherson's body was brought to Sherman at the Howard house. I wrote next day: "We were all made sad yesterday by the death of

General McPherson,—so young, so noble, so promising, already commanding a department!" I closed my report concerning him thus: "His death occasioned a profound sense of loss, a feeling that his place can never be completely filled. How valuable, how precious the country to us all, who have paid for its preservation such a price!" Logan immediately took the Army of the Tennessee, giving his corps to Morgan L. Smith. As soon as Hood, from a prominent point in front of Atlanta, beheld Hardee's lines emerging from the thickets of Bald Hill, and knew by the smoke and sound that the battle was fully joined, he hurried forward Cheatham's division to attack Logan all along the east front of Atlanta. At the time, I sat beside Schofield and Sherman near the Howard house, and we looked upon such parts of the battle as our glasses could compass.

Soon we saw the line of Logan broken, with parts of two batteries in the enemy's hands. Sherman put in a cross-fire of cannon, a dozen or more, and Logan organized an attacking force that swept away the bold

BATTLE OF ATLANTA, JULY 22D—RECAPTURE FROM THE CONFEDERATES OF DE GRESS'S BATTERY. II.

The recapture was made by troops of Logan's Fifteenth Corps. (This picture is a reproduction from the Panorama of Atlanta.)

Confederates by a charge in double time. Blair's soldiers repulsed the front attack of Cheatham's and Maney's divisions, and then, springing over their parapets, fought Bate's and Maney's men from the other side. The battle continued till night, when Hood again yielded the field to Sherman and withdrew. The losses on both sides in this battle of Atlanta were probably nearly even—about four thousand to each. Our gain was in morale.

EZRA CHURCH.

SHERMAN now drew his half-circle closer and closer, and began to manœuvre with a view to get upon the railways proceeding southward. The Army of the Tennessee was assigned to me by the President, and I took command on the 27th of July, while it was marching around by the rear of Schofield and Thomas, in order to throw itself forward close to Atlanta on the south-west side, near Ezra Church. Skirmishing briskly, Dodge was first put into line facing the city; next, Blair, beside him; last, Logan, on the right, making a large angle with Blair. He was not at night

quite up to the crest of the ridge that he was to occupy. In the morning of the 28th he was moving slowly and steadily into position. About 8 o'clock Sherman was riding with me through the wooded region in rear of Logan's forces, when the skirmishing began to increase, and an occasional shower of grape cut through the tree-tops and struck the ground beyond us. I said: "General, Hood will attack me here." "I guess not—he will hardly try it again," Sherman replied. I said that I had known Hood at West Point, and that he was indomitable. As the signs increased, Sherman went back to Thomas, where he could best help me should I need reënforcement. Logan halted his line, and the regiments hurriedly and partially covered their front with logs and rails, having only a small protection while kneeling or lying down. It was too late for intrenching. With a terrifying yell, Hood's men charged through the forest. They were met steadily and repulsed. But in the impulse a few Confederate regiments passed beyond Logan's extreme right. Four regiments came from Dodge; Inspector-General Strong led thither two from Blair, armed with repeat-

ing rifles; and my chief of artillery placed several batteries so as to sweep that exposed flank. These were brought in at the exact moment, and after a few rapid discharges, the repeating rifles being remarkable in their execution, all the groups of flankers were either cut down or had sought safety in flight.

This battle was prolonged for hours. We expected help from Morgan's division of Palm-

"Major-General Logan was spirited and energetic, going at once to the point where he apprehended the slightest danger of the enemy's success. His decision and resolution animated and encouraged his officers and men to hold on at all hazards."

JONESBORO'.

For a month, Hood kept to a defensive attitude, and, like a long storm, the siege opera-

tions set in. Sherman worked his right, with block after block, eastward and southward. Schofield and part of Thomas's command had passed beyond me, digging as they halted. Every new trench found a fresh one opposite. The lines were near together. Many, many officers and men were slain or wounded, and sent back to the hospitals. Dodge, while reconnoitering, was badly hurt; Ransom took his corps, and Corse a division in it. Hooker, already vexed at Sherman, was incensed at my assign-

THE "CALICO HOUSE," GENERAL SHERMAN'S HEADQUARTERS IN ATLANTA—
ALSO FOR SEVERAL MONTHS A HOSPITAL. (FROM A PHOTOGRAPH.)

er's corps, coming back from Turner's Ferry; but the Confederate cavalry kept that in check. Our troops here exhibited nerve and persistency; Logan was cheerful and hearty and full of enthusiasm. He stopped stragglers and sent them back, and gave every needed order. Blair was watchful and helpful, and so was Dodge. After the last charge had been repelled I went along my lines, and surely I felt proud and happy to be intrusted with such brave and efficient soldiers. Hood, again having lost three times as many as we, withdrew within his fortified lines. Our skirmishers cleared the field, and the battle of Ezra Church was won; and with this result I contented myself. One officer, who was a little panic-stricken, ran with the first stragglers to Sherman, and cried substantially, as I remember: "You've made a mistake in McPherson's successor. Everything is going to pieces!" Sherman said: "Is General Howard there?" "Yes, I suppose he is." "Well, I'll wait before taking action till I hear from him!" So Sherman sustained and trusted me, and I was content. Of General Logan, who has so recently gone from us, I wrote, after this battle:

ment, resigned, and went home. Slocum came to command the Twentieth Corps. Palmer, having a controversy concerning his seniority, left the Fourteenth Corps, and Jeff. C. Davis took his place. Hazen passed from a brigade in the Fourth (Stanley's) to M. L. Smith's division of Logan's corps. F. P. Blair, in a report, condensed the work of his corps, which exemplifies the whole, in these words:

"The command was occupied for twenty-eight days in making approaches, digging rifle-pits, and erecting batteries, being subjected day and night to a galling fire of artillery and musketry."

Sherman now having his supplies well up, beginning the night of the 25th of August, intrenched Slocum's strong corps across his railroad communication to defend it; then made another grand wheel of his armies. Schofield this time clung to the pivot. My command described an arc of twenty-five miles' radius aiming at Jonesboro', while Thomas followed the middle course. Both southern railways were to be seized, and the stations, bridges, culverts, rails, and ties to be destroyed.

Preceded by Kilpatrick, we made the march rapid enough considering the endless plague

of the enemy's horse artillery supported by Wheeler's cavalry, and the time it took us to break up the West Point railroad. At Rento Place we were to encamp the night of the 30th of August. Finding no water there, and also hoping to secure the Flint River bridge, six miles ahead, I called to Kilpatrick for a squadron. He sent me Captain Estes, a most energetic young man, and the horsemen needed. I asked Estes if he could keep the enemy in motion. He gave a sanguine reply, and rode off at the head of his men. Wheeler's rear-guard was surprised, and hurried toward the river. Hazen's infantry followed, forgetting their fatigue in the excitement of pursuit. We reached the bridge as it was burning, extinguished the fire, crossed over in the dusk of the evening under an increasing fire from hostile cavalry and infantry, but did not stop till Logan had reached the wooded ridge beyond, near Jonesboro'. The command was soon put into position, and worked all night and during the next morning to intrench, and build the required bridges. Hood had sent Hardee by rail, with perhaps half of his command, to hold Jonesboro'. My Confederate classmate, S. D. Lee, who had had the immediate assault at Ezra Church, here appeared again, commanding Cheatham's corps. At 3 P. M. the 31st, the Confederates came on with the usual vigor, but were met by Logan and Ransom, and thoroughly repulsed. Hood now abandoned Atlanta, and managed to unite with Hardee. Thomas, joining my left flank, fought mainly the battle of the 1st of September.

During this rest Blair and Logan went home on leave of absence: the field-force of the Army of the Tennessee was consolidated into two corps, Osterhaus temporarily commanding the Fifteenth, and Ransom the Seventeenth. Thomas went to Nashville, Wagner's division was sent to Chattanooga, and Corse's division to Rome. Colonel Tourtelotte had a small detachment at Allatoona Pass.

Hood had been threatening for some time to break Sherman's long line of communication and supply. Sherman could not divine where the blow would fall. He was already arranging for a campaign southward; but he wanted Grant's formal sanction, and he wished to make proper provision for Hood.

At last, the 2d of October, Hood had passed on his way back beyond the Chattahoochee. Sherman had waited for this till he was sure that the first attempt against his line would be south of the Etowah. Now, leaving one corps, Slocum's, at Atlanta, he followed Hood with the remainder of his force. Hood stopped near Dallas, and sent French's division to take the garrison of Allatoona and the dépôts there. From the top of Kenesaw, Sherman

communicated with Corse, who had joined Tourtelotte at Allatoona, and taken command. The popular hymn, "Hold the Fort," was based upon the messages between these chiefs and the noble defense that the garrison successfully made against a whole Confederate division. Sherman was coming, and French,

MAJOR-GENERAL JOHN M. CORSE, WHO "HELD THE FORT" AT ALLATOONA. (FROM A PHOTOGRAPH.)

several times repulsed with great loss, withdrew, and joined Hood at New Hope Church.

Taking up his northward march, Hood avoided Rome and aimed for Resaca. Schofield was warned, and got ready to defend Chattanooga, while Sherman now made forced marches so as to overtake his enemy and force him to battle. Finding us on his heels, Hood, picking up two or three small garrisons, but leaving untouched those that showed great pluck, like that of the resolute Colonel Clark R. Wever at Resaca, rushed through Sugar Valley and Snake Creek Gap, choking it with trees. My command following rapidly through the pass (October 16th), cut away or threw the gap-obstructions to the right and left, and camped close up to Hood's rear-guard. He again refused battle, and we pursued him beyond Gaylesville, Alabama. Between Gaylesville and Rome, General Ransom, a gallant and promising young officer, died from overwork and exposure due to our forced marches.

Taking advantage of a rich country, Sherman recuperated his men and moved slowly back to the Chattahoochee. Now, with the full consent of Grant, he hastened his preparations for his grand march to the sea.

CONFEDERATE CAMP, CITY HALL SQUARE, ATLANTA. FROM A PHOTOGRAPH TAKEN WHEN THE CAMP WAS OCCUPIED BY THE 2D MASSACHUSETTS.

GENERAL SHERMAN AND THE "MARCH TO THE SEA."*

FIFTH AVENUE HOTEL, NEW YORK,
December 22d, 1886.

MY DEAR SIR:

I beg to acknowledge receipt of your esteemed favor of the 20th instant, and trust you will pardon me if I adhere to my former conclusion not to attempt a magazine article on any war event. I do not profess the skill or patience of an historian, but only to be a witness before the great tribunal of the world, of scenes which I have witnessed or events in which I have shared. Of these I have testified fully in the two volumes of memoirs first published by the Appletons in 1875, and republished in 1885 in the form of a second edition, corrected and enlarged. In these volumes I believe I have recorded fully and truthfully all that seemed necessary, all at least that I purpose to do. Taking, for example, the "March to the Sea," to which you refer, I am sure I have given in the second volume every material fact of that feature of the civil war, which has to the public the charm of an epic because of its seeming novelty, its mysterious progress, and its glorious result — much of which was disputed at first, but is now more than confirmed by General Grant in his immortal "Personal Memoirs." Even my second edition was in the hands of the printers before I had seen General Grant's words in manuscript or print, so that our joint testimony must stand the test of time. True, many an orator in his safe office at the North had proclaimed his purpose to cleave his way to the sea. Every expedition which crossed the Ohio River in the early part of the war headed for the sea, but things were not ripe

till the Western army had fought, and toiled, and labored down to Atlanta. Not till then did a "March to the Sea" become practicable and possible of grand results. Alone I never measured it as now my eulogists do, but coupled with General Thomas's acts about Nashville, and those about Richmond directed in person by General Grant, the "March to the Sea" with its necessary corollary, the march northward to Raleigh, became vastly important, if not actually conclusive of the war. Mr. Lincoln was the wisest man of our day, and more truly and kindly gave voice to my secret thoughts and feeling when he wrote me at Savannah from Washington under date of December 26, 1864:

"When you were about leaving Atlanta for the Atlantic coast I was anxious, if not fearful; but feeling that you were the better judge, and remembering 'nothing risked, nothing gained,' I did not interfere. Now the undertaking being a success, the honor is all yours; for I believe none of us went further than to acquiesce; and taking the work of General Thomas into account, as it should be taken, it is indeed a great success. Not only does it afford the obvious and immediate military advantages, but in showing to the world that your army could be divided, putting the stronger part to an important new service, and yet leaving enough to vanquish the old opposing force of the whole, Hood's army, it brings those who sat in darkness to see a great light. But what next? I suppose it will be safer if I leave General Grant and yourself to decide."

So highly do I prize this testimonial that I preserve Mr. Lincoln's letter, every word in his own handwriting, unto this day; and if I know myself, I believe on receiving it I experienced more satisfaction in giving to his overburdened and weary soul one gleam of satisfaction and happiness, than of selfish

*Our readers will be interested in the above letter received by us from General Sherman in response to a request for an account of the Atlanta Campaign, and printed with his approval. They will also be glad to

know that we have since so far overcome General Sherman's reluctance as to induce him to prepare a paper on "The Grand Strategy of the War," which will appear in the magazine within a few months.—EDITOR.

pride in an achievement which has given me among men a larger measure of fame than any single act of my life. There is an old maxim of war, that a general should not divide his forces in the presence of an enterprising enemy, and I confess that I felt more anxious for General Thomas's success than my own, because had I left him with an insufficient force it would have been adjudged ungenerous and unmilitary in me; but the result, and Mr. Lincoln's judgment *after* the event, demonstrated that my division of force was liberal, leaving to Thomas "enough to vanquish the old opposing force of the whole, Hood's army," and retaining for myself enough to march to the sea, and thence north to Raleigh, in communication with the old Army of the Potomac which had so long and heroically fought for Richmond; every officer and soldier of which felt and saw the dawn of peace in the near approach of their comrades of the West who, having finished their task, had come so far to lend them a helping hand if needed. I honestly believe that the grand march of the Western army from Atlanta to Savannah, and from Savannah to Raleigh, was an important factor in the final result, the overwhelming victory at Appomattox, and the glorious triumph of the Union cause. All the leading facts have been published by General Grant, by myself, and by General J. D. Cox, and I prefer to leave others to fill out the episodes which give life and interest to the picture.

I certainly commend THE CENTURY MAGAZINE for its enterprise in collecting in a durable form many of these episodes, all varying more or less in describing the same event, or series of events, according to the tone and temper of the writer, the more valuable by reason of their variance, because every honest man sees things from a different standpoint, and can only write earnestly what he personally believes. The time is also opportune because the safety of the country cannot now be imperiled by jealousies and hatreds perfectly natural in the midst of horrid war; and therefore I again express my entire satisfaction with the course of your magazine in collecting from the witnesses while living their personal testimony,—every article of which I have read, in common with millions of our people. These will crystallize into history, the leading facts and results of which are already pretty well established, whilst the minor affairs will remain the subject of song and story to the survivors, who are fast giving place to new men, who, if wise, will profit by our mistakes and be thankful that we of 1861-5 caught the buffets of war, which otherwise would surely have fallen on them. The civil war is long since over, and though

bitter and terrible beyond the power of expression in words, its events seem to me as the memory of a dream; therefore, so far as I am concerned it must rest.

One single fact about the "March to the Sea" unknown to me was revealed by General Grant in his "Memoirs," Vol. II., page 376:

"I was in favor of Sherman's plan from the time it was first submitted to me. My chief of staff, however, was very bitterly opposed to it, and as I learned subsequently, finding that he could not move me, he appealed to the authorities at Washington to stop it."

I had been acquainted with General John A. Rawlins, General Grant's "chief of staff," from the beginning of the war. He was always most loyal and devoted to his chief, an enthusiastic patriot, and of real ability. He was a neighbor of General Grant in Galena at the breaking out of the war, a lawyer in good practice, an intense thinker, and a man of vehement expression; a soldier by force of circumstances rather than of education or practice, yet of infinite use to his chief throughout the war and up to the hour of his death as Secretary of War, in 1869. General Rawlins was enthusiastically devoted to his friends in the Western army, with which he had been associated from Cairo to Vicksburg and Chattanooga, and doubtless, like many others at the time,—October, 1864,—feared that I was about to lead his comrades in a "wild-goose chase," not fully comprehending the objects aimed at, or that I on the spot had better means of accurate knowledge than he in the distance. He did not possess the magnificent equipoise of General Grant, nor the confidence in my military sagacity which his chief did, and I am not at all surprised to learn that he went to Washington from City Point to obtain an order from the President or Secretary of War to compel me with an army of sixty-five thousand of the best soldiers which America had ever produced to remain idle when an opportunity was offered such as never occurs twice to any man on earth. General Rawlins was right according to the light he possessed, and I remember well my feeling of uneasiness that something of the kind *might* happen, and how free and glorious I felt when the magic telegraph was cut, which prevented the possibility of orders of any kind from the rear coming to delay or hinder us from fulfilling what I knew was comparatively easy of execution and was sure to be a long stride toward the goal we were all aiming at—victory and peace from Virginia to Texas. He was one of the many referred to by Mr. Lincoln who sat in darkness, but after the event saw a great light. He never revealed to me the doubts he had had.

With best wishes for your continued prosperity and success, I am, sincerely your friend,

W. T. Sherman.

MEMORANDA ON THE CIVIL WAR.

The Question of Command on Cemetery Ridge.

IN the March CENTURY Mrs. Warren publishes a letter of General Warren, written soon after the battle of Gettysburg, showing that General Meade's orders to him on the afternoon of July 2d were to look, not specifically to Round Top, as I have stated, but—a much wider mission—to the left of the army. I regret that I did not see that letter before writing my brief account, in which I dwelt less on General Warren's services than I would otherwise have done, because they were so universally recognized. The duty confided to him was a very responsible one, and, as the result shows, could not have been intrusted to better hands. The quickness with which he comprehended the threatened dangers in all their magnitude, when a simple incident revealed them to him as it would have done to few others, the apt measures he adopted to avert them, and, above all, the promptitude—his leading characteristic—with which he *acted*, saved both the Round Tops to us, disconcerted the enemy's plans, and proved General Warren to be what he was, one of the ablest and most meritorious of our generals.

In the same CENTURY General F. A. Walker of General Hancock's staff comments on my expressed belief that, had my instructions for the cannonade of July 3d been carried out by Captain Hazard, commander of the artillery of the Second Corps, the Confederate assault would not have reached our lines; and considers this "a very severe impeachment" of General Hancock's conduct of his artillery. I fully appreciate and honor the motive of General Walker's courteous criticism, and his very kind references to myself, but he writes under misapprehensions which are widespread and misleading, and which, as they place me in a false position, I beg leave to explain. He says:

"In the first place, two antagonistic theories of authority are advanced. General Hancock claimed that he commanded the *line of battle* along Cemetery Ridge. General Hunt in substance alleges that General Hancock commanded the infantry of that line, and that he himself commanded the artillery.

"Winfield S. Hancock did not read his commission as constituting him a major-general of infantry, nor did he believe that a line of battle was to be ordered by military specialists. He knew that by both law and reason the defense of Cemetery Ridge was intrusted to him, subject to the actual, authentic orders of the commander of the Army of the Potomac, but not subject to the discretion of one of General Meade's staff-officers. . .

"So much for the question of authority. On the question of policy there is only to be said that a difference of opinion appears . . . as to what was most expedient in a given emergency."

General Hancock's claim that he commanded all the troops of every description posted on his part of Cemetery Ridge is perfectly valid. It cannot be disputed, and I never questioned it. But all commands must be exercised subject to the established principles for the government of armies. Under these, commanders of special arms issue their own orders direct to their subordinates serving with army corps, who must submit them to the corps commanders with whom they

serve. The latter, being supreme on their own lines, can modify or countermand these orders, but by doing so they make themselves responsible for the result. Thus all conflicts or theories as to authority are avoided. Our "Regulations" (Scott's), adopted in 1821, reads:

"The superior officer of the corps of engineers, or of the artillery, serving with one of the army corps . . . will receive the orders of the commandant thereof, to whom the said superior officer of engineers or of artillery will communicate any orders he may receive from his own particular commandant-in-chief, attached to general headquarters."

Separate paragraphs provided rules for the military "staff" and administration,—the latter including the supply departments. "Staff-officers" are forbidden to give orders except in the names of their generals. From this rule administrative officers are specially exempted, their chiefs directing their respective departments in their own names, but subject to the control of their generals, with whom they serve.

All these regulations are essential to the management of a large army, but are only partly applicable to a two-company post, the school in which most of our officers both of the war-office and of the regiments were trained. So in the "Regulations" of 1861-3, they were all condensed into one short paragraph:

"Staff officers, and commanders of artillery, engineers, and ordnance, report to their immediate commanders the state of the supplies and whatever concerns the service under their direction, and receive their orders; and communicate to them the orders they receive from their superiors in their own corps."

Closely examined, this is correct; but it is obscure and misleading. It lumps together officers of the staff and of administration as "staff-officers," and so connects them with those of the special arms as seemingly to confirm the erroneous idea that engineer officers are staff-officers and of course that artillery officers must be the same. It is an odd notion, which could not find a lodgment in any other army than our own, that an artillery commandant-in-chief, a "corps commander" himself to all intents and purposes, and provided with a staff of his own, is "one of the staff-officers" who runs about a battle-field carrying "the actual and authentic orders" of the general-in-chief to other corps commanders. A "staff-officer" is an officer below the rank of brigadier, attached to the person or headquarters of a general as his aide or assistant.

To illustrate the general principle as to the service of the special arms, I quote from the "Instructions of Frederick the Great" to his artillery. He was himself, by the way, an "artillery specialist" of the highest order, yet I have never heard it suggested that this unfitted him for "ordering a line of battle." He was also a disciplinarian of the sternest school, yet he "almost preached insubordination" in order to reduce to a minimum the mischief that meddling with the artillery by any general, even the general-in-chief, might occasion. He says:

"It sometimes happens that the general in command, or some other general, is hurried, forgetful, and orders the fire to be opened too soon, without considering what important consequences may result from it. In such case the artillery officer must certainly obey, but he should fire as soon as possible, and point the pieces with the utmost precision, in order that his shots may not be thrown away."

As to the other question, that of policy, each general must decide it for himself, and General Hancock presumably acted according to his best judgment in the emergency suddenly presented to him when the cannon were opened. I do not know his reasons for countermanding my orders, and therefore cannot discuss them, even were I disposed to do so. As to the hypothetical case presented by General Walker, the possible effect of the enemy's cannonade on the *morale* of the troops, and his question, "Who was the better judge, General Hunt or General Hancock?" I may be permitted to reply, that a corps commander ought to be, so far as his own corps is concerned. It is, however, one of the necessary duties of an artillery commander to study the qualities of the other arms, for these must be considered in organizing and distributing the artillery, and are, as we see in this very case, important elements in determining its service. I had studied the Army of the Potomac, believed in its high qualities, and when, for special reasons, I instructed our batteries to withhold their fire for a given period, I knew the severity of the trial to which I was subjecting all the troops. I knew, also, that while the batteries would be the direct object of the enemy's fire, their men must stand idle at the guns and bear its full fury, while the infantry, lying on the reverse slope of the ridge and out of the enemy's sight, would be partly sheltered from it. Yet I felt no misgiving as to the fortitude of my cannoneers, and no doubt as to that of the infantry. I think I was justified by the event, for the troops on General Hancock's line where my instructions were not followed, and those on General Newton's line (on Hancock's immediate left), where they *were* followed, were in equal "heart and courage" for the "fearful ordeal of Longstreet's charge." The object of my orders, however, was to spare them this ordeal altogether by breaking up the charge before it reached our lines. Had my orders been fully carried out, I think their whole line would have been — as half of it was — driven back before reaching our position, and this would have given us our only chance for a successful counter-attack. As it was, the splendid valor of Pickett's division alone enabled the Confederates, although defeated, to preserve their *morale* intact.

Henry J. Hunt.

A Just Man and a Great Historical Work.

In the recent death of Lieutenant-Colonel Robert N. Scott of the Third Artillery, well known in connection with his work of compiling the War Records, the nation has met with a loss which is in many respects irreparable. It is not too much to say that no one now living possesses the intimate knowledge which Colonel Scott had gathered of the numerous disputed and still partly obscured points of our war history. The loss would be less if he had left written notes of his conclusions and of the records which sustained

them. Fortunately, however, the extended work upon which he was engaged — much greater, of its kind, than any Government has heretofore undertaken — is more advanced than many who have watched it since its inception suppose it to be.

Robert Nicholson Scott was born at Winchester, Tennessee, January 21st, 1838. His father was a widely known Scotch Presbyterian clergyman, and a man of untiring energy and great ability. In 1857, while with his father in San Francisco, young Scott was appointed second lieutenant in the Fourth Infantry. He was then nineteen years of age. Older officers under whom he served say that he was a marked man with them from the first. While full of life and sociability, there was a gravity, a large-mindedness, and a mature judgment manifested in the discharge of all duties committed to him that attracted the attention of his superiors. In November, 1861, he joined the Army of the Potomac with the rank of captain. He was engaged in the siege of Yorktown, was wounded at Gaines's Mill, and was brevetted Major for gallant conduct in that engagement. From June, 1863 to September, 1864 he was senior aide-de-camp to Major-General Halleck. He was lieutenant-colonel of volunteers on General Halleck's staff, and on duty with that officer at the headquarters of the army and the Military Division of the James until July, 1865. He went with General Halleck to the Pacific coast as adjutant-general of the Military Division of the Pacific, and served there with that officer until 1869, when he accompanied him to the Military Division of the South, where he served with him until 1872. It was during this long service with General Halleck, throughout which he held the most confidential relations with that officer, that he gained a knowledge which no other man of his rank, and few of any rank, acquired of the secret history of the war. A great part of Halleck's most confidential correspondence with Lincoln, Stanton, and the chief officers of the army is in the handwriting of Colonel Scott. On the 1st of January, 1878, he was ordered to Washington to take charge of the work of compiling the War Records. He was the author of a digest of military laws which is now the accepted authority to the time of its date. In addition to his duties in compiling the records, he was twice called on to assist in revising army regulations. He was assigned as the military secretary of the joint commission of the two Houses of Congress for the reorganization of the army under the Burnside bill, and at the time of his death was a member of a board to untangle, re-arrange, and revise the present compilation of army regulations. This wide range of duties performed under, or in association with, officers of great prominence, made him more generally known among those of high rank than almost any other officer of equal age and position. To this distinction can be added, as a crowning glory, that he gained and held the unqualified respect and cordial esteem of all.

To rich and varied stores of the most confidential knowledge concerning the moving reasons and forces which operated about the great headquarters, and of the real personal and official relations of those in command, Colonel Scott added severe, continuous, and methodical study. To guide him and give effect to his work he was possessed of thorough impartiality, unswerving

fidelity to the trust imposed in him, and a courage which forbade even hesitation upon the question of doing exact justice without fear of the powerful, or favor to friends. He was devoted to his work. For over nine years he scarcely left it. His days of recreation were very few, and were taken at long intervals. He not only gave his office hours to his task, but his nights at home as well. With the eagerness of an explorer, he pursued every clew which threw new light on the records. He spared no pains of research which promised to make any chapter of military history more complete. It is absolutely certain that he has never withheld a paper of any kind found in the records which, if added, would change the history by so much as a hair's breadth. It was such qualifications, and such use of them, that now give value to the great work which he has left.

The progress of this work is of national interest. The general examination of the immense mass of records, both Union and Confederate, in possession of the Government has been completed, and the material which properly belongs to the plan of the work has been selected, copied, and chronologically arranged. Of this selected material, that part relating to operations up to January 1, 1865, has been divided into chapters and volumes according to the plan of Colonel Scott, and this plan has received the formal approval of the Secretary of War. As adopted, it really fixes the arrangement of the material already gathered, covering the operations of the closing six months of the war.

The mass of records which have been examined filled scores of rooms in the War Department, and several large buildings besides. The records embrace the files of the War Department proper, and of the adjutant-general's office, engineer's office, ordnance office, and of the offices of the provost-marshal general, quartermaster-general, and commissary-general. The files of the adjutant-general's office, in addition to the records there made during the war, embrace all the records of the several departments, districts, military posts, etc., as well as those of all the armies, corps, divisions, brigades, and regiments. Besides all these, there are the corresponding records of the Confederate Government. The examination of this immense collection has been most thorough. Besides his own force, a large number of clerks in the office of the adjutant-general have been employed in the preliminary sifting and arranging. The work began in the summer of 1874, under Secretary Belknap, an appropriation of fifteen thousand dollars having been made to enable the Secretary of War "to have copied for the public printer all reports, letters, telegrams, and general orders not heretofore copied or printed, and properly arranged in chronological order." Both Secretary Belknap and Adjutant-General Townsend took great interest in the matter, as have all of their successors. The second year the appropriation was increased to fifty thousand dollars. The work was pushed with vigor, the best men in the War Department being assigned to it. A great collection of telegrams sent and received, and battle reports, both Union and Confederate, were selected and printed in volumes ready for the compiler. When Colonel Scott took charge, in January, 1878, much valuable preliminary work had been done, and the true magnitude of the undertaking began to appear. He at once organized a most efficient force, and began again at the very beginning. All col-

lected material was compared with originals, and the many omissions inseparable from preliminary examinations of such immense masses of records were supplied. He entered into correspondence with all officers yet alive whose records seemed incomplete, for the purpose of obtaining originals which might have been retained. No paper written since the war has been allowed a place; but all original papers have been accepted, and, where the owners desired, copied and returned. Through the efficient services of General Marcus J. Wright, the agent of the War Department for the collection of Confederate records, Colonel Scott received a great mass of material, and through his own efforts much more was gathered, until, considering the circumstances attending the dissolution of the Confederacy, the collection of Confederate records, including field-maps, is surprisingly complete.

Upon this immense collection of official material Colonel Scott had worked without intermission for nearly ten years. As a result, its examination is complete, and the material to be printed will make about fifty volumes. As several of these contain two or three parts, the total number of separate volumes will be about eighty. A large collection of maps has been made, covering the operations of both sides for the entire period of the war. These will appear in atlas form. Twenty-five separate volumes have been printed and issued of the operations from 1861 to January 20th, 1863. Fifteen other separate volumes, up to and including (nominal) Volume XXV., are stereotyped and ready for the index. The volumes for the rest of 1863 are, with one exception, ready for the printer. Of the operations for 1864, which run over to January 15th, 1865, and are embraced in Volumes XXXII. to XLIV., three are ready for the printer, four more are ready for final revision, and the plan and scope of the remaining six, including the subjects for each chapter, have been adopted. To close the work of compilation there remains only the arrangement of the material already collected for the period from January, 1865, to the disbandment of the armies.

It is fortunate that two men remain who have been active workers with Colonel Scott from the first, and who are thoroughly acquainted with his methods and plans. These are his chief clerk, Mr. J. S. Moodey, who has had special charge of the valuable indexes, and Mr. J. W. Kirkley, of the adjutant-general's office. There is also great reason for congratulation that the work has advanced so far toward completion. As it stands, it will endure as a fitting monument to an able, faithful, and impartial soldier.

P. S. — Since the above lines were written, Lieutenant-Colonel Henry M. Lazelle of the 23d Infantry has been ordered to assume the duties of compiler. Colonel Lazelle was born in Massachusetts, and was graduated from the Military Academy in 1855. During the war he was assistant commissary-general of prisoners until October, 1863, when he became colonel of the 16th New York Cavalry. Since the war he has been on staff duty on the frontier and in Indian campaigns, and from 1879 to 1882 commandant of cadets at West Point; and he was detailed to witness the movements of the British troops in India. His recent detail was that of inspector-general of the Department of the Columbia. He has been an excellent officer in a varied line of duties.

TOPICS OF THE TIME.

A New Era in our History.

BEYOND question the feature of the national administration since the 4th of March, 1885, which has engaged the largest share of public attention has been its attitude toward the civil service. This very significant fact marks the opening of a new era in our history, an era in which, for the first time, the proper conduct of the government, Federal, State, and municipal, assumes the first rank among political questions.

The United States as a nation started with a Constitution which challenges the fresh admiration of each new generation of Americans, and with methods of administration well suited to the small population of a thinly settled region on the eastern slope of the continent. In local affairs as a rule the town-meeting excellently served all the purposes of the community at a time when there were only about half a dozen cities, and the present metropolis itself, then barely ahead of Philadelphia, had but thirty-three thousand people. The young Republic had scarcely reached its majority before there came another war with England, and the "era of good feeling" which succeeded was soon disturbed by the first Nullification mutterings of the rising storm over the extension of the slave power. There were brief periods, as notably upon the introduction by Andrew Jackson of the spoils system in 1829, when statesmen found time and secured attention for the consideration of vital questions concerning governmental methods; but all the while, and more and more with the passage of the years, much as they tried to conceal it from themselves, people were chiefly concerned with the more fundamental question as to whether the Union itself were to endure. At last came the four years' struggle to determine whether the Government should survive. That ended, there ensued a long and most engrossing controversy to decide how "the fruits of the war" could most surely be garnered, and how the relations of the reconstructed States to the reconstituted Union should permanently be adjusted.

Meanwhile the nation had been growing from less than four millions of people to more than fifty; cities of great size had sprung up in what a century before had been a wilderness; nearly a quarter of the population had drifted into the cities and large towns; the office-holders of the Federal government alone had become an army more than one hundred thousand strong; old methods had been outgrown and become antiquated; new questions of administration, previously undreamed of, had arisen in national, state, and municipal affairs alike. The salvation of the Republic from the danger threatened by secession was no sooner assured than far-sighted men pointed out a fresh peril to its perpetuity. The war, which so largely widened the scope of government operations and increased the number of office-holders, greatly aggravated the evils which men like Webster, Clay, and Calhoun had predicted as certain to come when that most immoral of dogmas, "To the victor belong the spoils," was

adopted by both political parties as an article of faith. The late Thomas A. Jenckes, who unhappily died in 1875, a dozen years too soon to witness the triumph of his principles, must always be remembered for having possessed the insight to detect the danger, the wisdom to perceive the cure, and the persistence to extort attention from a reluctant Congress in the troublous years of the Andrew Johnson administration. Looking back to that stormy period and recalling the grave character of the reconstruction disputes, which culminated in the impeachment of the President, the country can better appreciate the force of the man, who, coming from the smallest State of the Union, secured a hearing for civil-service reform in 1866.

But it was scarcely more than a hearing that even Mr. Jenckes could secure, and he could not long keep the public ear. The slave had been freed; he was soon after enfranchised; but "the negro question" still remained the engrossing one. The attitude of the Federal government toward the States which had attempted secession was a subject of constant discussion for years after their Senators and Representatives again sat in Congress, and the frequent recourse to the use of Federal troops for the settlement of disputes in State capitals made the condition of the South the overshadowing subject of national attention. An experiment in the direction of carrying out the ideas of which Mr. Jenckes had been the apostle was made during Grant's administration, but although it received the hearty support of many thoughtful men, it never gained a strong hold upon the general public. There was always something else which the politicians insisted, and made the people believe, was the main issue. When Congress killed the experiment in 1874 by refusing the modest sum required to keep it going, only a small element felt any indignation, or, indeed, had any pronounced feeling on the subject either way.

Mr. Hayes rightly declared, in his letter accepting the Republican nomination for the Presidency in 1876, that the plank regarding civil-service reform in the party platform was "of paramount importance," and during his Administration the subject secured more general attention than ever before. But two great events were needed to make the proper conduct of the Government the most prominent question of the day. One was a proof, so startling as to impress the dullest mind, of the danger to the Republic which lurked in the spoils system. This was furnished by the assassination of Garfield at the hand of a disappointed office-seeker. The other event was a change in the control of the Government without the dreaded ruin to national interests and prosperity.

In 1881 the nation was made to feel the necessity of reform; in 1887 it sees that it can give its well-nigh undivided attention to the consideration of reform, and it is evidently going to do so, not merely so far as Federal offices are concerned, but State and municipal offices and administration as well.

Reform in Municipal Government.

THE passage by Congress early in 1883 of the Pendleton bill, applying the competitive principle to the minor places in the Washington Departments and in the chief custom-houses and post-offices of the country, was the corner-stone of a system which it is already certain will ultimately be developed throughout the Federal government. The contemptible failure of the feeble attempts in the Forty-ninth Congress to repeal the Pendleton law and to starve out the civil-service commission show that the reform "has come to stay." The public is far ahead of Congress in this matter. The changed tone of those newspapers which have always ridiculed the new system shows that they recognize their defeat. Experience has spoiled all their old arguments. There was the "college graduate" bogey, for instance. If we were to have examinations for admission to the service, it was declared "only college graduates would stand any show," and the young man who had never been beyond the common school "would be nowhere." Statistics showing that more than four-fifths of the successful contestants were men who had received only a common-school education have effectually disposed of this *ad captandum* plea, and the other clap-trap appeals to prejudice have fared no better. The old-time champions of the spoils system in the Federal government virtually confess their defeat, and the success of the competitive system in the State governments and chief cities of New York and Massachusetts assures its ultimate adoption by other States and municipalities.

Another reform no less important is now to be achieved. What is commonly called civil-service reform, so far as it has hitherto been carried in Federal, State and city governments, is chiefly a system for procuring good clerks, whose competency has been established by a competitive test. This is a matter of great importance, because it is fundamental. With the entrance to the service properly arranged, it is only a question of time when the whole service will be conducted upon sound principles. But this is only one phase of the great undertaking involved in a thorough-going reform of governmental methods. In a popular government the health of the body politic depends upon pure elections. The theory of the fathers was that when an office, like that of congressman, was to be filled, the people of a district would look about to see who was the fittest man to represent them, and elect him without the necessity of his doing anything in the matter. Cases are still known where the theory is carried into practice. A dozen years ago certain citizens of a Western Massachusetts district, disgusted with the ring which dictated the course of the dominant party, nominated President Seelye of Amherst College as an independent candidate for Congress, and elected him. His only connection with the canvass was to write a letter in reply to the notification of his nomination, consenting to be voted for. It was in the days when postage stamps were a cent higher than now, and Mr. Seelye used to say that his campaign expenses were only three cents—the cost of the stamp which he placed upon his letter of acceptance.

In New York City now, it costs a man from \$5000 to \$10,000 to run for Congress. In other words, he must pay out beforehand the salary for one, if not both, of

the years of the term. If he aspires to a position on the bench, he must expend in advance of the election \$10,000 or \$15,000 for one of the lower courts; perhaps \$20,000 for a place in the Supreme Court. If he is ambitious to become mayor, he must be willing to contribute as large a sum as \$24,000. These are only samples of the astonishing facts as to "assessments" which Mr. William M. Ivins, who has enjoyed exceptional opportunities for learning the truth, made public in his speech to the Commonwealth Club not long ago. Mr. Ivins showed exactly how the system works; how the "machines" which have been built up control on election day a well-disciplined force of 45,000 men, or one-fifth of the entire voting population, all of whom are under pay and have a pecuniary interest in the result. Mr. Joseph B. Bishop, in a speech at the succeeding meeting of the same club, presented the remedies, which he found in removing the necessity for assessments, by having the ballots printed and distributed by the city and at the city's expense, thus doing away with the army of machine workers at the polls; in limiting by law the expenditures of candidates; and in enacting a statute similar to the English "Corrupt Practices Act," forbidding bribery and undue influences of all kinds and fixing penalties.

The speeches of Mr. Ivins and Mr. Bishop, which were printed in full, attracted the notice not merely of the New York public, but of intelligent people throughout the country. The press of other cities appreciated that they must anticipate, where they have not already begun to suffer, the same evils unless a halt were called in New York; the rural press realized that the country cannot escape the introduction of similar abuses if they are allowed to remain permanently in the cities.

College Expenses.

THE commencement season brings its usual supply of newspaper articles on the inordinate expense of education in our modern colleges. In this case, as in so many others, the supply of articles meets a general demand. It is not easy for a father to foot enormous bills for his son at college with any patience, when he remembers the narrow fund which carried him through college, or for want of which he was compelled to give up the idea of going to college altogether. The newspaper article not only states his feeling in vigorous English, but gives him a tangible foundation for his feeling. It meets his case, and the case of countless others, too exactly not to find favor in their eyes. And so the newspapers brim with notes of the "average cost" of going through this college and that, and with reflections on the extravagance which is encouraged by the methods of the modern college life. There are, however, certain correctives which should go with the annual statistics.

An average may be mathematically true, and yet altogether delusive. "I make a statement that the average age of my friends is 20 years. If my friends are 18, 19, 20, 21, and 22 years of age, the average 20 is a useful and true expression. If, however, they are 10, 15, 20, 25, and 30, it is less useful; and if they are 4 of them 10 years old and 1 of them 60, the average 20 is still numerically correct, but it is absurd and untruthful in the impression it gives." The last case is quite parallel with the "averages" of the expenses of

classes at the various American colleges, as they are generally published in the newspapers. The few extravagant students are able to do so much more effective work at their end than the great body of the students can do at theirs, that the "average" goes up to a figure which is quite misleading. Meantime, in the teeth of all the averages, the great body of the students go on as their fathers did, and, even at those colleges which are selected as the most expensive of all, there is always a smaller body of students who are working their way through college and showing that the "average" has no real relation to the question. There is not a college in America from which poverty alone need detain a student; there is not one from which he may not graduate, provided he has that amount of ability which will make a college education a benefit, and provided, also, he is willing to work before and through his course, and deny himself, as was the custom in our fathers' days.

It is this last custom which is going out of existence; and that is enough to show that the root of the evil does not lie in the college, but in the home. The very parents who speak so bitterly of the encouragement given to young men's extravagance by the modern college life have carefully trained their sons for just the life which they have found. Usually men in moderate circumstances, they have never compelled their sons to earn a dollar in their lives, or to know the cost or value of money, or to deny themselves anything within their reach, or to do anything except spend money when a favorable opportunity offered. The sons, passing for the first time beyond the father's eye, and able to plead circumstances which parents cannot deny from personal knowledge, are in a fair position to deplete the paternal pocket-book, and have never been trained to refrain from improving such an opportunity. It is not for his own selfish gratification that the son joins this or that college society, or takes all the college papers, or "goes with the nine" to watch an inter-collegiate game in another college town, or does any of the other things for which his father has to pay,—not at all; it is only because he would be ostracized in college if he refrained from such indulgences. Such are the statements which accompany the periodical petitions for checks; and the father, finding it easier to curse college extravagance than to take the trouble of ascertaining the true state of the case, continues his mis-training of the boy by paying his bills until, at the end of the college course, the son is turned loose upon the world, to find at last what a dollar really means.

In nine cases out of ten, the student's self-control, if it led to a refusal to be enticed into unnecessary expenditures, would be simply ignored by the other students of his college. There are always cliques which would ignore himself as well; and, to this extent, the dreaded "war" might be endured. But this difficulty is purely subjective; it is in the student himself, and its roots are in his home-training. If he has come to college to cultivate or value the society of such cliques, the penalty has an effective force; if he has been trained to undervalue or ignore the penalty, it has no power over him. When he yields to it and writes home that he "must have" money for this, that, or the other purpose, the father who supplies this demand is cultivating further the son's vanity, and

further preparing vexation of spirit for himself. For him to pay the money and thus increase the evil, while he considers it the unperformed duty of the college authorities to suppress all the societies, expel the editors of all the college papers, and abolish the inter-collegiate games, is merely another example of the decadence of American home-life and discipline. The father expects the college to do for the son what the home no longer does for him; he sends the college flabby material, and expects the material to be turned into such strong, self-poised, self-controlled manhood as the American home once furnished to the college. If the children's teeth are set on edge, it is largely because the fathers have eaten sour grapes.

There can be little doubt that two-thirds of the material now sent to college would be bettered by being put into a workshop of some kind for two years between the ages of twelve and sixteen. The spread of comfort among the people has been steadily increasing the number of those who can spare their sons the necessity of work even through their years of early manhood; and we have not yet come to understand the full measure of the injury which is thus done to the character of the boy. At the same time, the colleges have been developing in a direction which gives greater and still greater freedom to the student, and thus brings into constantly greater prominence the evils resulting from the modern American system of home-training. To check the college in its natural course of development, to demand that it shall cease its proper work and attend to wrapping the student in cotton-wool and keeping him from the temptations incident to every really manly life, would be merely to make permanent and irreparable the damage which is being done to young American manhood. Things must be worse before they can be better. American parents must learn that education is not an affair of books alone; that it is not complete when so many books have been finished and so many term-bills paid; that a true education consists even more largely in the training of the character and of the will than in book-knowledge. When American homes send to American colleges boys who have been trained to discriminate between the accidents of life and its essentials, the complaints of college extravagance will disappear, and a good many other evils will go with them.

The Metropolitan Spirit.

THE current year has been remarkable for its conspicuous proofs that matters æsthetic and scholarly are taking a wider and deeper hold upon the people of the leading American city. New York is becoming metropolitan not merely in intention, but in fact. The metropolitan spirit is abroad in society, and the year 1887 will be memorable for the long step then taken in advancing our gigantic community in the right direction. The city has never been behind in religious and charitable exertion; of late years its politics have been not a little improved, and the work of purification was never more active than now, nor ever was urged more strongly and directly toward fundamental reforms. But the artistic revival of a dozen or fifteen years ago has had a sudden fruition within the last year or two that goes along with a revival in all

æsthetic matters and should be especially noted for encouragement and example.

The recent celebration of the centennial of an important date in the history of Columbia College has drawn public attention to an institution which shows abundant signs of rejuvenation. The college is still a college in name, but its tendency toward a genuine university establishment is emphasized in many ways; notably in the conduct of its library, which, in its printed treasures and in its lecture courses, is a college in itself, the benefits of which are wisely and generously extended with few restrictions to the entire community.

The dinner to James Russell Lowell, Charles Waldstein, and the trustees of the American School of Classical Studies at Athens, was an event in line with the general movement; and it is evident that the proper endowment of this school is sure to follow soon. The Metropolitan Museum has shared in the æsthetic generousities of the time, and has received some splendid legacies and gifts. There is already the surety, also, of the generous endowment of a new and highly important scheme for the direct advancement of American art, in all its branches. Along with these signs of the times have come annual exhibitions of special interest—exhibitions which proclaim that the new generation of painters and sculptors have something in them beside suggestion and promise.

The prosperous and growing Free Library scheme,

and the Tilden bequest to the same general purpose, are a part of the new movement.

It is evident that New York is yearly becoming a better city to live in.

The Lincoln History.

THE current installment of the *Life of Lincoln and History of his times* reaches and includes an account of the famous Lincoln-Douglas Debates. Although Lincoln had for years been opposed to Douglas in political discussions, the great struggle between these giants of debate did not occur till in 1858 they simultaneously appealed to the people of Illinois for election to the United States Senate. The readers of the *Life* will fully appreciate the necessity felt by the authors to record amply and clearly the occurrences in Kansas, in Congress, and in the Supreme Court which led up to the political situation of 1858 and the celebrated canvass of that year in Illinois. This momentous debate, which sent Douglas to the Senate and Lincoln to the White House, cannot be fully understood, in all its subtleties of argument and allusion, by those who are unfamiliar with the political events of immediately preceding years.

The *Life*, which will certainly lose nothing in interest as it approaches more nearly the war period, will deal in August with Lincoln's Ohio speeches and the Cooper Institute speech, and in September with Lincoln's nomination and election.

OPEN LETTERS.

Labor and Capital.

A CONNECTICUT EXPERIMENT.

IF Mr. Walter Besant wishes to see a working model of the "Palace of Delight" so movingly described by him in that "impossible story" of his which bears the preposterous title, "All Sorts and Conditions of Men," let him cross the ocean and visit the thrifty Connecticut town of Bridgeport. The novelist's notion is that the chief trouble with the working people is their lack of pleasure; and that pleasure enough is within their reach, cheap and wholesome, if they only knew where and how to find it. His theory is, therefore, that the philanthropist who can show the poor how to enjoy themselves is a better friend than the one who can increase their income; that he who can make one innocent pleasure grow where there was none before is a greater benefactor than he who puts two dimes into a purse where there was one before. Therefore he would turn the efforts of those who seek to improve the condition of the people in our cities toward the problem of brightening their lives by providing them with social amusements, or, better, toward the task of teaching them how to amuse themselves. That this kind of philanthropy, like every other, will cost something, his fable teaches; but his contention is that money and effort expended along this line will produce the best results.

What Mr. Besant would see, if he came to Bridgeport, is a beautiful building, nearly ready for occupation, somewhat less magnificent than the airy nothing of his creation, and bearing the less ambitious design-

nation of "Seaside Institute." It stands near Seaside Park, in the western suburb of the city, directly across the street from the factory of the Warner Brothers, by the side of which it has grown as the honeysuckle grows upon the cornfield wall,—the flower drawing its beauty and its fragrance from the same kindly soil that nourishes and ripens the grain. The Warner Brothers are manufacturers of corsets, and they employ about one thousand women of various sorts and conditions, most of them young and unmarried. A bright, comely, wholesome-looking company of young women they are; four or five hundred of them might be picked out who, judging their intelligence by their faces, would not look out of place in the chapel at Smith, Wellesley, or Vassar. The average weekly wage of this thousand is about seven dollars each,—a larger amount than women in such callings generally earn,—which indicates that the dealings of the firm with its employees are not wholly regulated by competition.

For a long time these employers have been studying the problem of the working-girl, and trying to find out how they could best improve her condition. They knew that a large share of the earnings of these girls must go for board and room-rent; that it was possible for few of them to afford any but narrow, ill-lighted, ill-ventilated, unwarmed lodgings, and that no cheerful and comfortable place was open to them in which they might spend their leisure hours. They knew that the presence of so many of these girls in the skating-rinks and on the streets in the evening was due, in large part, to the fact that they had nowhere else to

go. They knew, moreover, that the kind of food furnished in such boarding-houses as they must patronize was in many cases inferior and unwholesome. Under such conditions it is not strange that the working-girls of the cities often develop abnormal appetites, and various tastes, and rude manners; the wonder is that so many of them keep their health unbroken and their characters unsullied. And these men of good-will, striving with what seems to be a sincere philanthropy for the welfare of the thousand women by whose labor they are accumulating their fortune, determined to build for them, if not a "Palace of Delight," at least a Hall of Comfort, in which shelter and care and companionship and opportunities of wholesome diversion and of mental cultivation should be freely furnished them.

This "Seaside Institute" will cost the builders about forty thousand dollars. It is a shapely building externally — no mere barracks, but a well-proportioned and winning structure, seventy-five feet square and three stories in height, proclaiming in its very form the presence of other than "economical" motives. In the basement is a large refectory, with kitchen attached, in which the best of plain food will be furnished at cost. Those who wish will be permitted to order by the card; a glass of milk for a cent, or a cup of coffee at the same price, indicate the scale of the charges. An experienced and popular caterer tells me that the actual cost of the food is not more than this — that the project is feasible from this point of view. Those girls who wish may obtain regular board at this refectory, at prices not to exceed two dollars and a half a week. It is hoped that the charge may be less than this. "The food will be prepared," say the proprietors, "by experienced cooks, and served in the best manner." The value of this provision for the comfort and health of the girls can be estimated only by those who have tested the cooking of the average cheap boarding-house. To be permitted to sit down in a bright and airy room, at a clean and prettily furnished table, to a well-cooked meal, will seem to many of these young women a foretaste of Paradise. In the determination to make this part of their plan serviceable to their employees, the proprietors will not haggle about the cost. If the refectory should not quite pay expenses, the bill of fare will not be cheapened, but the deficiency will be provided for.

The floor above is entered from the street by a wide porch which opens into a generous hall, on the left of which is a reception and conversation room, connecting by sliding doors with a music-room in the rear. Back of this is an ample lavatory with numerous bath-rooms — a most sumptuous provision for the comfort of the girls, and one which they are sure to appreciate. On the right of the hall is the great reading-room or common-room, a spacious and beautiful apartment, and in the rear of this, and communicating with it, the library, surrounded by low cases whose shelves will be filled with books for the use of the girls. Here, too, will be found numerous writing-tables and full supplies of writing-materials.

An easy stairway leads to the second floor. The first apartment on the right of the hall is a room to be furnished with sewing-machines, where the girls will be able to do their own sewing. Farther on are two or three class-rooms, in which evening classes will be taught in any branches which the young women may

desire to study. The plan is to permit them to organize these classes for themselves, in any branch in which they may desire instruction, — singing, penmanship, book-keeping, type-writing, stenography, fancy needlework, or whatever they wish; for all classes so organized, containing a certain number, teachers will be provided. The other side of this story is occupied by a large assembly-room, seating five or six hundred, with stage and anterooms, in which lectures, concerts, and entertainments of all kinds may be given to the inmates. It is hoped that they will take Mr. Besant's hint with respect to the use of this room, and learn how to furnish with these facilities a large part of their own diversion.

Several pianos will be located in different parts of the building, on which students of music will be permitted to practice. A competent matron will be put in charge of the Institute, to whose wisdom the general management will be largely intrusted. The whole building is warmed by steam and lighted by electricity.

The design is to furnish an attractive and delightful home for these young women during all the hours when they are not at work or asleep. The question about lodgings has been considered by the Messrs. Warner, but they have not been satisfied of the wisdom of furnishing these. It is possible that they may yet need lodging-houses in the neighborhood of the Seaside Institute; but at present they are not convinced that it may not be better for their women to keep their rooms in private families. The proprietors have found by investigation that half of their employees live within half a mile of the factory, so that the Institute will be easily accessible to most of them. Several rooms in the third story will be furnished as lodgings into which any of the women who are ill, or temporarily without homes, may be received, under the matron's care.

"All of the benefits afforded by the establishment," say the proprietors, "will be substantially free, except food, which will be furnished at or below cost. All the women who are in the employ of Warner Brothers will be entitled to any of the educational, literary, musical, and social privileges that may be furnished." There has been a question whether a small fee, say one dollar a year, might not secure a more general and freer use of the privileges of the Institute; whether the girls would not more readily avail themselves of a provision which was not entirely gratuitous. If any such charge should be made, it would be nominal, and only for the purpose of extending the benefits of the Institute.

Another feature of the institution is thus described by one of the proprietors: "We shall have connected with the building a savings bank, in order to encourage our hands to save some portion of their earnings. I have long since learned that what one earns has little to do with what he saves. One with an income of ten thousand dollars is no more likely to lay aside a portion of his earnings than one with an income of one thousand. The principle of saving is either inherited, or it must be cultivated, and it is to encourage this principle that this branch of the institution will be established. This privilege will be extended to all our help, male and female." Every employee who deposits two dollars a month is also promised that a half-dollar will be added to the deposit by the employers; and interest will be paid on all deposits, besides the bonus allowed.

It is evident that a considerable amount will be re-

quired to pay the operating expenses of this institution, and although this will be taken, at present, from the profits of the business, it is not to be left unprovided for in the event of a change in the proprietorship; for a sum of money is being set apart as a permanent fund for the endowment of the Institute, that it may go on doing its beneficent work after its proprietors have passed to their reward.

In these days, when the hearts of the compassionate are torn by so many harrowing tales of man's inhumanity to working-women, it is pleasant to be able to set forth the good deeds of these two chivalrous employers. Under the law of competition, which always pushes the weakest to the wall, women are the slaves of the labor market. They have not learned to combine; they have no power to resist the oppression of conscienceless capital; the price of their labor is therefore fixed by the most rapacious employers. Against them "the iron law of wages," in its bitterest sense, is continually being enforced. By a logic which is as inexorable as the grave, their compensation tends to starvation-point, nor does any merely "economical" force appear for their deliverance. The less they receive, the less they are able to earn; the labor-force in them is weakened by their impoverishment. The pictures that Helen Campbell has been showing us of the "Prisoners of Poverty" in New-York exhibit the natural result of unrestrained competition. If the women who work are to be rescued from their wretchedness, it must be done by the appearance on their behalf of such knightly employers as these, who decline to build their fortunes upon the woes of women, and who determine to share their gains with those who have helped to gather them. Of course all this is done in sheer despite of the economical maxims. In the thought of such employers, "business is business," and something more: it is opportunity; it is stewardship; it is the high calling of God. Not being omniscient I cannot pretend to discern all the motives of these employers, nor have they shown in my presence any disposition to make any parade of their philanthropy; but I visited their manufactory, by the side of which is planted this fair flower of their charity, and I have seen with my eyes what they are trying to do, and the thing which appears is this: that these two men are working as studiously, as resolutely, as patiently to improve the condition of their employees as they are to enlarge their fortunes. I believe that the one purpose lies as near their hearts as the other.

Are they alone in this? By no means. The number of those employers who find the vocation of the captain of industry to be a humane and a benign vocation is steadily growing. It was never growing so fast as it is to-day. The past two years, with all their strifes and turmoils, have wrought wonders in this realm. It begins to be evident enough that no organization of industry is stable and productive which does not bring in goodwill as one of the working forces. It is just as true of industry as of art, that

"He that shuts Love out, in turn shall be
Shut out from Love, and on her threshold lie
Howling in outer darkness."

The age of the soulless money-maker is passing; the new nobility is coming to its own.

It may be asked whether a higher justice, if not a true charity, would not require these employers to distribute directly in wages the money which they are

devoting to this institution. I do not think so. They are giving their employees more than the market rate of wages for such service; and this institution will be worth far more to these women than the money which it costs would be if it were divided among them. The aggregate amount of comfort, of enjoyment, of health, and of welfare which this institution will produce will be indefinitely greater than they could purchase for themselves with the same sum. This is due, in part, to economical causes; for comfort is a commodity that like most other commodities can be far more cheaply produced on the large scale. The benefits of coöperative housekeeping, after which a generation of burdened housekeepers have struggled in vain, are secured for these employees by the good providence of their employer. There are moral reasons, also, for preferring this method of distribution; for many of these beneficiaries would not, in their present state of mind, be likely to receive any real benefit from an increase of wages; a little more candy, a few more ribbons, an additional number of evenings in the skating-rink or the cheap theater would tell the story of their added income. They need, most of all, higher tastes, simpler enjoyments, and habits of frugality; and the Seaside Institute is intended to lead them gently toward these higher things. When they have found this kingdom, many things can be added unto them.

Washington Gladden.

Christian Union.

FROM THE BAPTIST POINT OF VIEW.

THE recent articles in *THE CENTURY* on the general subject of Christian union have been in a high degree interesting and instructive. He must be a very blind observer of "the signs of the times" who does not discover strong tendencies toward a closer union among all denominations of Christians. At the New York State Baptist Pastors' Conference held last fall at Poughkeepsie, a unanimous resolution was passed expressing this desire in explicit and emphatic terms. No body of Christians is more earnest than is the great Baptist denomination — numbering in the United States its millions — in offering the prayer of our Lord: "That they all may be one." By no formal appointment do I represent the denomination in this "Open Letter"; but I am quite sure that I do not misrepresent its spirit and efforts.

Three facts seem very plain to many at this time.

First. The great denominations are drawing nearer together in their forms of service. Churches which have not a liturgy, in the technical sense of that term, are adopting more elaborate forms of worship than they formerly used. On the other hand, some churches, which come into the category of liturgical churches, are omitting, in some of their services, some of their usual forms. In some of the revival or "mission" services everything which once distinguished liturgical churches is wanting. One might think in attending these services that he was at one of Mr. Moody's meetings. These "missions" are themselves an illustration of the tendency here named. They are simply "revivals," as the term has been used for generations among the more fervent Presbyterians, Baptists, and Methodists. The Roman church adopted them in forms adapted to

than other methods of work; and some Episcopal churches have now come into the line of work long followed by other bodies. The same unifying tendency is seen in services in connection with the reception of new members and in preparation for the observance of the Lord's Supper. This two-fold modification of services indicates progress along the line of union; it is prophetic of greater progress soon to be made. It is greatly wise in every way. The oldest forms of creed, prayer, litany, chant, and hymn are the property of no one denomination. To claim a monopoly in their use is to manifest hopeless ignorance and unpardonable bigotry. As well might one claim a monopoly of the sunshine or the evening breeze.

Second. The different denominations to-day have essential union. At present organic union is undesirable. It is possible only by making dangerous compromises. A union which is possible only to those who believe anything or nothing to secure it, is bought at too dear a price. Honest convictions must be respected. Better that men differ honestly than agree by being indifferent to all creeds. Essential union is possible and actual to-day among the great majority of our Protestant churches. There are to-day wider differences among some of the branches of the Roman church than between some of the different churches in our great Protestant host. There are churches in this city, not Roman, of the same name, which differ more widely in spirit and life than do certain other churches bearing different denominational names. Rationalism and Romanism, in many of their distinctive features, may be found under the same church name and authority. Here is organic but not essential union. When churches of different names work along the line of their honest convictions of the teachings of God's word, they have essential union; coming near to their common Lord, and coming near to lost men, they come genuinely near to one another. Such union is worth much. An organic union, secured by concessions, compromises, and concealments of honest convictions, is a positive damage to all concerned.

Third. Christian union, both essential and organic, is greatly retarded because many Christians refuse to accept the plain teaching of God's word, and the conclusions of the highest scholarship regarding the subjects and the act of baptism. Baptists hold that Christ alone can make laws for his church; and that the Bible is the only rule of faith and practice. They believe that this word teaches with unmistakable clearness that believers are the only subjects of baptism, and that baptism is the immersion of believers into the name of the Father, the Son, and the Holy Spirit. If the Bible does not clearly teach these truths, what truths does it clearly teach? More explicit are its utterances on these subjects than regarding the divinity of Christ, or any article in the orthodox creeds. As a matter of fact, there are in this country to-day millions who cannot accept sprinkling or pouring as baptism. But all men, always and in all places, accept immersion as baptism; not to accept it, is not to accept baptism. If ever there is organic union it will be at the baptistery. *Baptists care little for the mode of baptism.* The person to be baptized may kneel in the water, and be baptized forward; or he may stoop until the water flows over his head; or he may be baptized backward. But Baptists insist upon baptism. They cannot accept a substitute for the
